General Index

Entries cover drugs (by monograph title, other approved names, synonyms, and chemical names), diseases (by disease treatment review title and associated terms), and proprietary preparations (by proprietary or brand name). They are arranged alphabetically in word-by-word order. Page references give both the page and column number as in 476·1, where 476 represents the page number and the figure 1 indicates that the entry will be found in column 1 of that page. There is no column number when the entry is in a table.
