Pertussis Immunoglobulins

Inmunoglobulinas contra la tos ferina.

ATC — J06BB13.

Pharmacopoeias. Many pharmacopoeias, including *US*, have monographs.

USP 31 (Pertussis Immune Globulin). A sterile solution of globulins derived from the plasma of adult human donors who have been immunised with pertussis vaccine. It may contain glycine as a stabilising agent, and a suitable preservative. It should be stored at 2° to 8°.

Adverse Effects and Precautions

As for immunoglobulins in general, p.2201.

Interactions

As for immunoglobulins in general, p.2201.

Uses and Administration

Pertussis immunoglobulins have been used for passive immunisation against pertussis (whooping cough) and to prevent or modify pertussis in susceptible persons who have been exposed to infection.

Preparations

USP 31: Pertussis Immune Globulin.

Pertussis Vaccines

Vacunas de la tos ferina.

ATC — J07AJ01; J07AJ02.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii), have monographs.

Ph. Eur. 6.2 (Pertussis Vaccine (Adsorbed); Vaccinum Pertussis Adsorbatum). A sterile suspension of inactivated whole cells of one or more strains of *Bordetella pertussis* in saline to which hydrated aluminium phosphate or aluminium hydroxide has been added. It may contain a suitable antimicrobial preservative. The estimated potency is not less than 4 units per dose. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that wP may be used on the label.

Ph. Eur. 6.2 (Pertussis Vaccine (Acellular, Component, Adsorbed); Vaccinum Pertussis sine Cellulis ex Elementis Praeparatum Adsorbatum). A preparation of individually prepared and purified antigenic components of *Bordetella pertussis* adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. It contains either a suitably prepared pertussis toxoid or a pertussis toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. It may also contain filamentous haemagglutinin, pertactin, and other defined antigens such as fimbrial-2 and fimbrial-3 antigens. The final vaccine contains not more than 100 units of bacterial endotoxin per dose. It may contain a suitable antimicrobial preservative. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that aP may be used on the label.

Ph. Eur. 6.2 (Pertussis Vaccine (Acellular, Co-purified, Adsorbed); Vaccinum Pertussis Sine Cellulis Copurificatum Adsorbatum). A preparation of antigenic components of *Bordetella pertussis* adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that aP may be used on the label.

Adverse Effects

As for vaccines in general, p.2201.

Local reactions may occur at the site of injection of pertussis vaccines or pertussis-containing vaccines and use may be followed by fever and irritability. Local reactions and fever occur less frequently with the acellular vaccine than with whole-cell vaccine, especially in children over 6 months of age and adults. However, booster doses of acellular pertussis-containing vaccines are associated with an increased risk of injection site reactions.

Severe reactions which have been reported include persistent screaming and generalised collapse but these effects were generally associated with an earlier type of vaccine and the reactions are stated to be rarely observed with the currently available vaccines.

Rare neurological adverse reactions have included convulsions and encephalopathy. There has been much debate, however, on the causal role of pertussis vaccine in such reactions (see below for detailed discussion). It should be remembered that neurological complications occur more frequently as a consequence of pertussis infection than from vaccination.

Asthma. A higher incidence of asthma was reported in 243 children who had received whole-cell pertussis vaccine than in 203 children who had not.[1] However, follow-up of a large Swedish study[2] showed no difference in the incidence of wheezing or allergic reactions between children who had received diphtheria, tetanus, and whole-cell pertussis vaccines and those who had not. A later prospective study[3] also found no evidence that whole-cell pertussis vaccination increased the risk of wheezing illness in young children. Furthermore, no association was found between pertussis vaccination in infancy and development of asthma in children aged up to 7 years in a later study of the same group of children.[4]

4. Maitra A, *et al.* Pertussis vaccination in infancy and asthma or allergy in later childhood: birth cohort study. *BMJ* 2004; **328:** 925–6.

Effects on the nervous system. There has been continuing debate over several decades concerning the perceived link between pertussis vaccination and brain damage. Anxiety among both the public and health care professionals in the UK in the mid-1970s over the safety of whole-cell pertussis vaccines led to a fall in the acceptance rates for infant vaccination and major epidemics of pertussis in 1977/79 and 1981/83. Since that time confidence has been restored and, with the introduction of acellular vaccines, the vast majority of infants now receive the vaccine before their second birthday. Comparison of whole-cell vaccines with acellular vaccines has since confirmed that the latter are associated with a greatly reduced incidence of serious neurological disorders.[1]

The consensus of opinion now seems to be that there is a temporal, but not necessarily causal, relationship between whole-cell pertussis vaccine and acute neurological illness that may occasionally lead to long-term dysfunction, and that risks of not immunising are greater than the potential risks associated with the vaccine.

The difficulty in ascertaining whether a causal relationship exists between whole-cell pertussis vaccine (usually given as diphtheria, tetanus, and pertussis (DTP) vaccine) and acute neurological reactions arises partly because primary vaccination is given at an age when neurological dysfunction with other causes is often first manifested. The observed temporal relationship may be entirely coincidental, may result from indirect factors such as pyrexia after vaccination, or may represent a direct effect of DTP vaccine. Much of the evidence is based on large epidemiological studies,[2-7] in particular the National Childhood Encephalopathy Study (NCES)[8] from the UK and its 10-year follow-up.[9] Serious acute neurological illnesses reported to the NCES[8] were found to be more common in infants immunised within 7 days (relative risk 2.4), and especially within 72 hours of onset, than in unimmunised children. For previously normal children, irrespective of outcome, the risk was estimated as 1 in 110 000 injections. In a subset of cases diagnosed as infantile spasms,[10] no link with vaccination was found overall, but there was a small excess of cases of infantile spasm in previously normal children who had received either DTP or diphtheria and tetanus vaccines during the previous 7 days (relative risk 2.0-2.5) followed by a corresponding deficit during the next 3 weeks. This suggested that vaccination may trigger the onset of spasms in a child with an underlying predisposition.

In 1991, the USA Institute of Medicine reviewed the available data, including the NCES results, and concluded that a causal relationship between the whole-cell pertussis component of DTP vaccine and acute encephalopathy probably existed, with an estimated excess risk of 0 to 10.5 per million vaccinations.[11] They concurred with the conclusion that a causal relationship between vaccination and infantile spasm was unlikely.

The NCES 10-year follow-up found that children who had had a serious acute neurological illness (excluding infantile spasms) had an increased risk of death or long-term dysfunction, but the risk was no greater in children given DTP vaccine in the 7 days before the original acute illness.[9] The National Vaccines Advisory Committee concluded that the results were insufficient to determine whether DTP vaccine influenced the development of chronic neurological dysfunction, and this conclusion has been accepted by both the Advisory Committee on Immunization Practices[12] and the American Academy of Pediatrics.[13]

Precautions

As for vaccines in general, p.2202. The precautions and contra-indications to the use of pertussis vaccines have sometimes been more stringent than is now considered necessary because of the controversy about their potential adverse effects, especially neurotoxicity (see under Adverse Effects, above). In the UK it is now recommended that immunisation should continue with acellular pertussis vaccine even when episodes of fever (irrespective of severity), hypotonic-hyporesponsive episodes, persistent crying or screaming, or severe local reactions (irrespective of extent) have occurred after a preceding dose. Children who have had a local or general reaction to a whole-cell pertussis vaccine should complete their immunisation with acellular pertussis vaccine.

Whether or not children with a personal or family history of convulsions or epilepsy or who have suffered cerebral damage in the neonatal period should receive pertussis vaccines appears to have been the most difficult question to resolve in the past. In the UK it is now considered that a family history of seizures is not a contra-indication to immunisation. When a child has a history of seizures associated with fever, but no evidence of neurological deterioration, immunisation should proceed as normal; advice on the prevention of fever should be given at the time of immunisation (see Fever and Hyperthermia, p.10 for comments on the prevention of fever after immunisation). Similarly when there is a history of seizures not associated with fever, but no evidence of neurological deterioration, immunisation should proceed as normal. If a seizure associated with fever occurs within 72 hours of immunisation, further immunisation should be deferred until the condition is stable if no underlying cause is found and the child has not recovered completely within 24 hours. Immunisation should also be carried out in children with a history of cerebral damage in the neonatal period unless there is evidence of an evolving neurological abnormality. In children with a neurological problem that is still evolving it is recommended that immunisation should be deferred until the condition is stable. If a child develops encephalopathy or encephalitis within 7 days of immunisation, further immunisation should be deferred until the condition is stable if no underlying cause is found and the child has not recovered completely within 7 days.

A personal or family history of hypersensitivity reactions is not generally considered to be a contra-indication to the use of pertussis vaccines, and neither are stable neurological conditions such as spina bifida, congenital brain abnormality, or perinatal hypoxic ischaemic encephalopathy.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Pertussis vaccines are used for active immunisation against pertussis (whooping cough) (p.185). Acellular pertussis vaccines have taken the place of whole-cell vaccines in several countries including the UK and the USA.

For primary immunisation combined pertussis vaccines, usually diphtheria, tetanus, and pertussis vaccines (p.2210) or diphtheria, tetanus, pertussis, poliomyelitis, and haemophilus influenzae vaccines (p.2212) are used. For pre-school boosters diphtheria, tetanus, pertussis, and poliomyelitis vaccines (p.2211) are sometimes given. For discussion of immunisation schedules, see below.

Immunisation schedules. Pertussis is a common, highly infectious, respiratory disease, mainly affecting children, and for which there is no effective treatment. WHO estimates that 20 to 40 million cases of pertussis occur annually and that the disease is responsible for 200 000 to 400 000 deaths each year. The highest incidence of pertussis occurs in developing countries where immunisation is low.

Combined vaccines are now used in most countries but both the strength of the pertussis component and production methods vary, leading to vaccines of different potencies. The considerably higher cost of acellular over whole-cell pertussis vaccines means that the latter are still used widely in developing countries.

Depending upon the country, the age at which a child is given the first dose of a combined vaccine varies from 5 weeks to 6 months. (For summaries of immunisation schedules in the UK and USA, see under Vaccines, p.2202.) In countries with a high incidence of pertussis, WHO recommends that immunisation should start at 6 weeks of age and that the schedule involve 3 doses at monthly intervals followed by a booster dose at 18 months to 6 years of age. In the UK and USA, booster doses should be given after the end of the primary series of 3 injections before entry to school. Several reports have described the use of a 2-dose widely-spaced primary immunisation schedule and this would indeed simplify procedures in developing countries; however, the limitation of such a schedule is the long period of risk between doses without adequate protection and unless the interval can be shortened to 4 weeks, the wide use of such a schedule is not advisable in endemic areas.

Vaccine development. Dissatisfaction with whole-cell vaccines in the 1970s because of adverse reactions led to reduced uptake and a resurgence of pertussis in several countries. In Japan, research into less reactogenic pertussis vaccines resulted in the introduction of acellular vaccines for routine vaccination in the early 1980s. Acellular pertussis vaccines can contain a variety of pertussis components:

- pertussis toxin (PT; also formerly known as lymphocytosis-promoting factor, LPF)
- filamentous haemagglutinin (FHA)
- pertactin (PRN)
- fimbrial agglutinogens (FIM) 2 and 3

The acellular vaccines commonly used are a 3-component vaccine containing PT/FHA/PRN and a 5-component vaccine containing PT/FHA/PRN/FIM2/FIM3. The vaccine used in combination vaccines for primary immunisation in the UK is the 5-component vaccine. The 3-component vaccine does not provide the same level of protection against whooping cough in primary immunisation. Both 3-component and 5-component vaccines may be used in combination vaccines for pre-school boosting. The combination vaccine used for pre-school boosting that contains 5-component pertussis vaccine does not provide the recommended strength of diphtheria to be used for primary immunisation.

Acellular vaccines are now recommended in the UK and USA for both primary immunisation in infants and for the booster doses in young children before school entry. Whole-cell vaccines are still, however, widely used in other countries, particularly in the developing world.

Preparations

Ph. Eur.: Pertussis Vaccine (Acellular Component, Adsorbed); Pertussis Vaccine (Acellular, Co-purified, Adsorbed); Pertussis Vaccine (Adsorbed).

Proprietary Preparations (details are given in Part 3)

Pigbel Vaccines

Vacunas de la enteritis necrotizante.

Profile

A vaccine against pigbel (necrotising enteritis), a disease occurring mainly in children in the highlands of Papua New Guinea, is used for active immunisation against the disease. The vaccine consists of an adsorbed *Clostridium perfringens* type C toxoid.

◊ An immunisation programme, in which pigbel vaccine was given to children at 2, 4, and 6 months of age and, initially, to older children, was introduced in Papua New Guinea in 1980.[1] A survey found a sustained overall fall in the incidence of severe pigbel in children coincident with the increased induced immunity. However, protection may be relatively short-lived and boosters may be necessary for full protection of young children.

1. Lawrence GW, *et al.* Impact of active immunisation against enteritis necroticans in Papua New Guinea. *Lancet* 1990; **336:** 1165–7.

Plague Vaccines

Vacunas de la peste.

ATC — J07AK01.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Plague vaccines have been used for active immunisation against plague in those occupationally exposed to the organism and in some field workers in infected areas. They may reduce morbidity and mortality in bubonic plague but their activity against pneumonic plague is unknown.

Pneumococcal Vaccines

Vacunas neumocócicas.

ATC — J07AL01; J07AL02.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii), have monographs.

Ph. Eur. 6.2 (Pneumococcal Polysaccharide Vaccine; Vaccinum Pneumococcale Polysaccharidum). A mixture of purified polysaccharide capsular antigens from 23 differing serotypes of *Streptococcus pneumoniae*. Each 0.5-mL dose contains 25 micrograms of each of the 23 polysaccharide types. An antimicrobial preservative may be added. The vaccine has a pH of 4.5 to 7.4. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that Pneumo may be used on the label.

Ph. Eur. 6.2 (Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed); Vaccinum Pneumococcale Polysaccharidicum Coniugatum Adsorbatum). A solution of purified immunochemically different capsular polysaccharides obtained from *Streptococcus pneumoniae* serotypes individually conjugated to a carrier protein. The vaccine may be adsorbed on a suitable adjuvant or adsorbant. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that Pneumo(conj) may be used on the label.

Adverse Effects and Precautions

As for vaccines in general, p.2201. Unless otherwise stated, the information below refers to the unconjugated polyvalent vaccine.

Revaccination of adults is not routinely recommended because of the increased incidence and severity of adverse reactions.

Pneumococcal vaccination is relatively ineffective in patients with multiple myeloma, Hodgkin's and non-Hodgkin's lymphoma, especially during treatment, and in chronic alcoholism. In patients with Hodgkin's disease the use of pneumococcal vaccines is not recommended in those who have received extensive chemotherapy or nodal irradiation. Pneumococcal vaccines should be given at least 2 weeks (and preferably 4 to 6 weeks) before starting immunosuppressive therapy or be delayed until at least 3 months after completion of therapy.

A satisfactory response to the unconjugated polyvalent pneumococcal vaccines is not obtained in children less than 2 years of age and therefore immunisation of this age group with this vaccine is not recommended. However, a pneumococcal conjugate vaccine is available that may be given to infants from 2 months of age.

Effects on the blood. Relapses have occurred on rare occasions in patients with stabilised idiopathic thrombocytopenic purpura at 2 to 14 days after vaccination against pneumococcal infections, lasting for up to 2 weeks. One such case was reported[1] following revaccination less than 2.5 years after an uneventful primary vaccination with pneumococcal vaccine.

1. Neil VS. Long term management after splenectomy: revaccination may cause relapse. *BMJ* 1994; **308:** 339.

Effects on the kidneys. Glomerulonephritis was described[1] in a splenectomised patient after use of pneumococcal vaccine. It was postulated that high antibody titres from a recent pneumococcal infection could have contributed. Minimal change nephrotic syndrome with mild interstitial nephritis following pneumococcal vaccination was suggested as the cause of oedema of the face and legs, visual disturbance suggestive of uveitis, and massive proteinuria in a 67-year-old woman who had been vaccinated about 4 months earlier.[2]

1. Tan SY, Cumming AD. Vaccine related glomerulonephritis. *BMJ* 1993; **306:** 248.
2. Kikuchi Y, *et al.* Minimal change nephrotic syndrome, lymphadenopathy and hyperimmunoglobulinemia after immunization with a pneumococcal vaccine. *Clin Nephrol* 2002; **58:** 68–72.

Effect of nutritional status. An impaired antibody response to pneumococcal vaccine was reported[1] in elderly patients with low serum concentrations of vitamin B_{12}.

1. Fata FT, *et al.* Impaired antibody responses to pneumococcal polysaccharide in elderly patients with low serum vitamin B12 levels. *Ann Intern Med* 1996; **124:** 299–304.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Of the many serotypes of *Streptococcus pneumoniae* the 23 from which antigens are obtained for the most commonly available pneumococcal vaccine are considered to cause up to 96% of pneumococcal disease.

Pneumococcal vaccines are used for active immunisation in those at increased risk from infection with the types of *Streptococcus pneumoniae* contained in the vaccine. Pneumococcal vaccines may be in the form of an unconjugated 23-valent polysaccharide vaccine (suitable only for patients over 2 years of age) or as a conjugate vaccine containing 7 serotypes (suitable for infants aged 2 months to 5 years).

In the UK, it is recommended that immunisation should be considered in all persons aged 65 and over; persons who have undergone splenectomy and those with splenic dysfunction, including that due to sickle-cell anaemia and coeliac disease; patients with immunodeficiency or immunosuppression due to disease or treatment, including HIV infection at all stages; persons with chronic cardiac, pulmonary, hepatic, or renal impairment, including nephrotic syndrome, or diabetes mellitus; persons with CSF shunts; children under 5 years old who have previously had invasive pneumococcal disease such as meningitis or septicaemia; and persons with cochlear implants.

An antibody response develops by the third week, and usually lasts about 5 years. The antibody response is less reliable and declines more rapidly in young children and persons with impaired immune function.

A single dose of 0.5 mL of the 23-valent vaccine, containing 25 micrograms of each of the 23 polysaccharide types, is given to at-risk adults and children over 5 years of age by intramuscular injection (or subcutaneously if there are bleeding disorders). The vaccine should be given at least 2 weeks (but preferably 4 to 6 weeks) before elective splenectomy, chemotherapy, or other immunosuppressive treatment. Revaccination is not generally recommended except, after 5 years, in patients likely to have rapidly declining antibody concentrations (for example, those with asplenia or splenic dysfunction and those with nephrotic syndrome).

The 7-valent pneumococcal conjugate vaccine is given by intramuscular injection. In the UK it is recommended that at-risk infants under 6 months should be given 3 single doses of 0.5 mL at intervals of 1 month, starting at 2 months of age, with a fourth dose given in the second year of life; those aged 6 to 11 months should receive 2 doses at least one month apart with a third dose given in the second year of life; and those aged 12 to 60 months should receive 2 doses at least two months apart. The 23-valent pneumococcal polysaccharide vaccine should also be given to the highest risk children (those with asplenia or splenic dysfunction and those with nephrotic syndrome) after their second birthday and at least 2 months after the final dose of conjugate vaccine.

In the USA, three doses of the 7-valent pneumococcal conjugate vaccine are recommended as part of the routine primary immunisation schedule at 2, 4, and 6 months of age. The 23-valent pneumococcal polysaccharide vaccine should be given to high-risk groups between the ages of 2 and 18 years in addition to previously administered 7-valent pneumococcal conjugate vaccine. The 23-valent vaccine is also used in at-risk adults similarly to that outlined for the UK above.

Preparations

Ph. Eur.: Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed); Pneumococcal Polysaccharide Vaccine.

Proprietary Preparations (details are given in Part 3)
Arg.: Imovax Pneumo†; Neumak†; Pneumo 23; Pneumovax 23; Prevenar; Prote-Neu; ***Austral.:*** Pneumovax 23; Prevenar; ***Austria:*** Pneumo 23; Pnu-Imune†; Prevenar; ***Belg.:*** Pneumo 23; Pneumovax 23†; Pneumune†; Prevenar; ***Braz.:*** Pneumo 23†; Pneumovax 23†; Vacina Pneumococica Conjugada 7-valate; Vacina Pneumococica Polivalente; Vacina Pneumococica Polivalente Pneumo 23; ***Canad.:*** Pneumo 23; Pneumovax 23; Prevnar; ***Chile:*** Pneumo 23; Prevenar; ***Cz.:*** Pneumo 23; Prevenar; ***Denm.:*** Pneumo Novum; Pneumovax; Prevenar; ***Fin.:*** Pneumovax; Prevenar; ***Fr.:*** Pneumo 23; Prevenar; ***Ger.:*** Pneumopur†; Pneumovax 23; Prevenar; ***Gr.:*** Pneumo 23; Pneumovax 23; Pnu-Imune 23†; Prevenar; ***Hong Kong:*** Pneumo 23; Pneumovax 23; Prevenar; ***Hung.:*** Pneumo 23; Pneumovax 23; Prevenar; ***Indon.:*** Pneumo 23; Prevenar; ***Irl.:*** Pneumovax II; Pnu-Imune†; Prevenar; ***Israel:*** Pneumo 23; Pneumovax 23; Prevnar; ***Ital.:*** Pneumo 23; Pneumopur†; Pneumovax; Pnu-Imune 23†; Prevenar; Streptopur; ***Malaysia:*** Pneumo 23; Pneumovax 23†; Prevenar; ***Mex.:*** Pnu-Imune 23†; Prevenar; Pulmovax; ***Neth.:*** Pneumo 23; Pneumovax 23; Prevenar; ***Norw.:*** Pneumovax; Pnu-Imune†; Prevenar; ***NZ:*** Pneumo 23; Pneumovax 23; Prevenar; ***Philipp.:*** Pneumo 23; Prevenar; ***Pol.:*** Pneumo 23; Pneumovax 23; Prevenar; ***Port.:*** Pneumo 23; Pneumovax 23; Pnu-Imune†; Prevenar; ***S.Afr.:*** Imovax Pneumo 23; Pneumovax 23; Prevenar; ***Singapore:*** Pneumo 23; Pneumovax 23; Prevenar; ***Spain:*** Pneumo 23; Pnu-Inmune†; Prevenar; ***Swed.:*** Pneumo 23; Pneumovax†; Pnu-Imune†; Prevenar; ***Switz.:*** Pneumovax 23; Pnu-Imune 23†; Prevenar; ***Thai.:*** Pneumo 23; Pneumovax 23†; Prevnar; ***Turk.:*** Pneumo 23; ***UK:*** Pneumovax II; Prevenar; ***USA:*** Pneumovax 23; Prevnar; ***Venez.:*** Imovax Neumo 23†; Prevenar.

Poliomyelitis Vaccines

Polio Vaccines; Poliovirus Vaccines; Vacunas de la poliomielitis.
ATC — J07BF01; J07BF02; J07BF03.

NOTE. Inactivated poliomyelitis vaccines are sometimes termed Salk Vaccine and live (oral) poliomyelitis vaccines are sometimes termed Sabin Vaccine.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Poliomyelitis Vaccine (Inactivated); Vaccinum Poliomyelitidis Inactivatum). A liquid preparation of suitable strains of poliomyelitis virus, types 1, 2, and 3, grown in suitable cell cultures and inactivated by a suitable method. Permitted antibacterials may be used in its production and it may contain preservatives. It should be stored at 2° to 8° and be protected from light.
The BP 2008 states that IPV may be used on the label.

Ph. Eur. 6.2 (Poliomyelitis Vaccine (Oral); Vaccinum Poliomyelitidis Perorale; Poliomyelitis Vaccine, Live (Oral) BP 2008). A liquid preparation of suitable live attenuated strains of poliomyelitis virus, types 1, 2, or 3, grown in suitable, approved cell cultures; it may contain any one of the 3 virus types or combinations of them. The trivalent vaccine is standardised for virus titre which is not less than 6.0 log $CCID_{50}$ for type 1, not less than 5.0 log $CCID_{50}$ for type 2, and not less than 5.5 log $CCID_{50}$ for type 3 per dose. Permitted antibacterials may be used in its production. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.
The BP 2008 states that OPV may be used on the label.

USP 31 (Poliovirus Vaccine Inactivated). A sterile aqueous suspension of poliomyelitis virus, types 1, 2, and 3, grown separately in cultures of monkey kidney tissue and inactivated. Suitable antimicrobial agents may be used during production. It should be stored at 2° to 8°.

Adverse Effects

As for vaccines in general, p.2201.

Vaccine-associated paralytic poliomyelitis has been reported rarely in recipients of oral poliomyelitis vaccines and in contacts of recipients (see below).

Carcinogenicity. Some poliomyelitis vaccines given in the 1950s and 1960s were found to be contaminated with Simian virus (SV40) from the monkey cell cultures used in the manufacturing process.[1] Once the contamination was realised, steps were taken to eliminate it from future vaccines. However, SV40 is believed to possess biological properties consistent with cancer-causing viruses and epidemiological studies have consequently been conducted to assess whether vaccine recipients have subsequently developed cancer. Although these studies did not find any increased cancer risk, a report by the USA Institute of Medicine in 2002 concluded that these studies were sufficiently flawed to preclude any conclusion being reached. Studies have also assessed the risk to offspring of women given these vaccines during pregnancy (see below). Vaccines now in use do not contain SV40 as they are not manufactured using monkey cell cultures.

Effects on the nervous system. There have been several case reports of the isolation of poliovaccine virus from the CSF after use of oral poliomyelitis vaccine. A 7-year-old girl who had previously been vaccinated with inactivated poliomyelitis vaccine in infancy received oral vaccine and developed prolonged headache, vomiting, and fever but no paralysis;[1] poliovirus was subsequently isolated from her CSF 34 days after she had received the oral vaccine, and it was concluded that her previous immunisations had been ineffective. In a further report,[2] poliovirus was isolated from the CSF of 2 infants with ventriculoperitoneal shunts who had developed aseptic meningitis without paralysis following oral poliomyelitis vaccination. A neurovirulent variant of Sabin type 2 oral poliomyelitis vaccine virus was detected in both the CSF and stools of an infant with transient hypogammaglobulinaemia who developed meningoencephalitis, retinitis, and irreversible hearing loss after oral poliomyelitis vaccination.[3] A 6-year-old girl given oral poliomyelitis vaccine at 1 and 2 years developed acute disseminated encephalomyelitis and a mutated form of poliovirus was isolated from her CSF;[4] it was thought that she had been infected with the mutated virus from extrafamilial contacts and that the cause of her condition may have been related to her HLA type.

GUILLAIN-BARRÉ SYNDROME. A small cluster of cases of Guillain-Barré syndrome was seen[1] in children after a mass oral poliomyelitis vaccination campaign in Finland in 1985. An increased frequency of Guillain-Barré syndrome was also seen in adults. However, a direct link with poliovaccine virus infection could not be established and no link between Guillain-Barré syndrome and oral polio vaccine was found by a subsequent, epidemiological study in California.[2]

VACCINE-ASSOCIATED PARALYTIC POLIOMYELITIS. Although generally considered safe and effective, in extremely rare cases the live attenuated virus in oral poliomyelitis vaccines can cause vaccine-associated paralytic poliomyelitis (VAPP) in either the vaccine recipient or in a close contact. There is no such risk associated with inactivated poliomyelitis vaccines. The incidence of VAPP is about 1 case in every 2.5 million doses of vaccine and may be increased in immunocompromised patients. A case control study[1] identified intramuscular injections given within 30 days of vaccination as a risk factor in the development of VAPP. This phenomenon, known as provocation paralysis or provocation poliomyelitis, has been described with the wild virus[2] and has been recognised as a factor in vaccine-associated paralysis in the UK and USA.[3] Paralytic poliomyelitis in contacts of vaccine recipients can be further reduced by ensuring that parents without evidence of previous immunisation receive the vaccine at the same time as their children. The benefits of oral poliomyelitis vaccination are considered to greatly outweigh the small risk involved, however, and many countries where the risk of wild virus-caused poliomyelitis has been reduced to zero are now considering combined immunisation schedules with both oral and inactivated poliomyelitis vaccines.

Precautions

As for vaccines in general, p.2202.

Poliomyelitis vaccine may contain trace amounts of antibacterials such as neomycin, polymyxin B, and streptomycin and should be used with caution in patients with severe hypersensitivity to these antibacterials.

Oral poliomyelitis vaccines should not be given to patients with diarrhoea or vomiting.

Because the vaccine virus of oral poliomyelitis vaccines is excreted in the faeces for up to 6 weeks, the contacts of recently vaccinated babies and infants should be advised of the need for strict personal hygiene, particularly hand washing after napkin changing, in order to reduce the possibility of infection in unimmunised contacts. Unimmunised adults can be immunised at the same time as their children.

Immunocompromised patients are at increased risk of developing vaccine-associated paralytic poliomyelitis. Oral poliomyelitis vaccines should not be given to immunocompromised patients or their household contacts and in these persons an inactivated vaccine should be used. Asymptomatic HIV-positive persons may receive oral poliomyelitis vaccines but faecal excretion of the vaccine virus may continue for longer than in uninfected individuals. For symptomatic HIV-positive persons the use of inactivated poliomyelitis vaccine may be considered.

Intramuscular injections given after the oral vaccine may also increase the risk of vaccine-associated paralytic poliomyelitis (see above).

Pregnancy. Live vaccines such as *oral poliomyelitis vaccines* are generally contra-indicated in pregnancy because of a theoretical risk to the fetus. Population-wide mass vaccination programmes become impossible, however, if pregnant mothers and women of child-bearing age are to be excluded.[1] In February 1985, mass vaccination with live oral poliomyelitis vaccine was started during a poliomyelitis outbreak in Finland.[1] Pregnant women were advised to take the vaccine. An analysis of all reported congenital malformations in the years 1982 to 1986 suggested that oral poliomyelitis vaccine had no harmful effects on fetal development as measured by overall prevalence of malformations or by the incidence of either CNS or orofacial defects. The results did not, however, exclude an effect measurable by other criteria of fetal development.

The incidence of spontaneous abortions was measured during a mass poliomyelitis vaccination campaign in Israel.[2] The number of spontaneous abortions did not differ between controls and women vaccinated during the first trimester of pregnancy; the percentage of spontaneous abortions in relation to live births was also similar. Microscopic examination of placentas from spontaneous abortions indicated no effect of oral poliomyelitis vaccine on the frequency or type of pathological changes. In addition, subsequent epidemiological study[3] found no increases in congenital malformations or in premature births during the period of and immediately following the vaccination campaign compared with those born before the campaign.

The Collaborative Perinatal Project (CPP) in the USA[4] followed up 50 897 pregnancies to examine risk factors for the development of malignancies in offspring born between 1959 and 1966. In 18 342 children whose mothers were vaccinated during pregnancy with *inactivated poliomyelitis vaccines*, there were 14 malignancies (7.6 per 10 000), while in 32 555 non-exposed children there were 10 malignancies (3.1 per 10 000). There were 7 tumours derived from neural tissue in the exposed children (3.8 per 10 000) and one in non-exposed children (0.3 per 10 000). Thus there was an excess of neural tumours but not of leukaemias or other malignancies in children exposed *in utero* to inactivated poliomyelitis vaccine. No malignancies occurred among the children born to 3056 women who received oral poliomyelitis vaccine. Serum samples collected from mothers on entry into the CPP and at delivery were subsequently analysed[5] for the presence of antibodies to Simian virus 40 (SV40). None of the serum samples from 8 mothers of infants with neural tumours had antibodies to SV40. Two of the 7 mothers of infants with leukaemia had SV40 antibodies, but only one had conversion during pregnancy. None of the samples from the 7 mothers of children with other types of cancer had antibodies. Three of 36 controls had antibodies, but in both the first and second samples. The association between administration of inactivated poliomyelitis vaccine to mothers and neural tumours in their offspring could not be attributed to contamination of vaccine with SV40. A later analysis[6] of 54 796 children enrolled in the CPP found an increased risk of neural tumours and of haematological malignancy in children whose mothers had received pre-1963 poliomyelitis vaccine, but concluded that this was unlikely to have been due to transmission of SV40.

Interactions

As for vaccines in general, p.2202.

Normal immunoglobulins. Although the use of live vaccines and immunoglobulins at the same time is generally not recommended, normal immunoglobulin had no effect on the antibody response to oral poliomyelitis vaccine when the 2 preparations were given together to 50 subjects.[1]

1. Green MS, *et al*. Response to trivalent oral poliovirus vaccine with and without immune serum globulin in young adults in Israel in 1988. *J Infect Dis* 1990; **162:** 971–4.

Uses and Administration

Poliomyelitis vaccines are used for active immunisation against poliomyelitis. For discussion of immunisation schedules, see under Vaccines, p.2202. Both live (oral) poliomyelitis vaccines and inactivated poliomyelitis vaccines are available. The oral vaccine stimulates the formation of antibodies both in the blood and in the mucosal tissues of the gastrointestinal tract.

In the UK, an inactivated poliomyelitis vaccine containing the 3 types of poliovirus (trivalent) is recommended for the primary immunisation of all age groups, given as a course of 3 doses at intervals of 4 weeks. It is given intramuscularly as a combined diphtheria, tetanus, pertussis (acellular component), poliomyelitis (inactivated), and Haemophilus influenzae vaccine. For children who received primary immunisation during infancy, reinforcing doses are recommended at school entry (diphtheria, tetanus, pertussis, and poliomyelitis) and before leaving school (diphtheria, tetanus, and poliomyelitis). Further reinforcing doses are necessary only in adults exposed to infection including travellers to countries where poliomyelitis is epidemic or endemic and healthcare workers in contact with poliomyelitis cases. A single dose is given, repeated every 10 years if necessary.

In the USA, the recommended schedule consists of four doses of inactivated vaccine given at 2 months, 4 months, 6 to 18 months, and 4 to 6 years of age.

On the occurrence of a single case of paralytic poliomyelitis from wild virus, a single dose of the oral vaccine is recommended for all persons in the neighbourhood, regardless of whether they have previously been immunised. A primary course should be completed in previously unimmunised individuals.

Choice of vaccine. Two types of poliomyelitis vaccine are available: live attenuated oral poliomyelitis vaccine (OPV) and inactivated (killed) poliomyelitis vaccine (IPV) given by injection. Both vaccines are highly effective against all 3 types of poliovirus but there are advantages and disadvantages associated with their use.

The *advantages* of OPV are:

- it produces an immune response in both the blood and in the lining of the gut, thus preventing both spread of infection to the CNS and multiplication of the virus in the gastrointestinal tract and hence transmission via the stools and saliva
- it is given orally and is therefore easy to give without specialist training
- it is relatively inexpensive, an important consideration in developing countries in particular.

The *disadvantage* of OPV is:

- it causes very rare cases of vaccine-associated paralytic poliomyelitis (VAPP).

The *advantage* of IPV is:

- it is not a live vaccine and as such carries no risk of VAPP.

The *disadvantages* of IPV are:

- it confers very little immunity in the gastrointestinal tract, hence when an individual immunised with IPV is infected with wild poliovirus the virus can still multiply in the intestines and be shed in the stools, thus risking continued transmission
- trained health workers are required to give it by injection
- it costs far more than OPV.

Poliomyelitis has now been eradicated from most countries in the world (see below) and hence many, including the UK and the USA, consider it appropriate to use IPV exclusively for routine immunisation. However, the Global Polio Eradication Initiative will continue to use OPV where necessary until global eradication is achieved, at which time it has stated that the use of OPV should cease as soon as possible while population immunity against poliomyelitis and surveillance sensitivity for paralysis remain high, and be replaced by routine use of IPV.[1]

1. WHO. Framework for national policy makers in OPV-using countries: cessation of routine oral polio vaccine (OPV) use after global polio eradication. Geneva: WHO, 2005. Also available at: http://www.polioeradication.org/content/publications/OPVCessationFrameworkEnglish.pdf (accessed 12/10/05)

Eradication of infection. In 1988, WHO announced the goal of eradicating poliomyelitis by the year 2000. Other bodies joined the project which became known as the Global Polio Eradication Initiative.[1] Although the goal was not achieved in 2000, very considerable progress has been made. In 1988, wild poliovirus was endemic in 125 countries and more than 1000 children became paralysed every day. In 2005, only 4 countries still had endemic poliomyelitis. However, some countries are experiencing re-infection (11 by the end of August 2005) and in 2005, for the first time, case numbers were higher in these re-infected countries than in those where the disease is endemic. This illustrates the vulnerability of countries considered free of poliomyelitis when resultant low routine immunisation coverage puts children at risk. The global incidence of polio remained unchanged from 2005 to 2006.[2] A renewed goal was set of global polio eradication by the year 2008.

Pseudomonas Vaccines

Vacunas de pseudomonas.

Profile

A number of candidate *Pseudomonas aeruginosa* vaccines are under investigation for the prevention of pseudomonal infections in a variety of disease states.

◊ *Pseudomonas aeruginosa* is notably resistant to many antibacterials and there has consequently been considerable interest in developing an effective vaccine against it.[1-4] However, clinical results have tended to be disappointing, and together with improvements in antibacterial management have meant that no such vaccine is yet available for clinical use.

Early attempts in the 1960s at developing a vaccine focused on cell wall components (lipopolysaccharides). Multivalent lipopolysaccharide vaccines were tested in *animals* and in patients, including burns patients and patients with various forms of cancer and acute and chronic lung disease but, despite some positive results, these vaccines never gained clinical acceptance because of problems associated with the use of lipopolysaccharides. Vaccines designed at targeting the toxic exoproduct of *Ps. aeruginosa*, exotoxin A, produced mixed results at best; there has also been interest in exotoxin A toxoid in combination with other protective immunogens and in multicomponent and conjugate vaccines. There was brief interest in ribosomes and ribosomal RNA vaccines but these fell out of favour.

The discovery that motility was associated with *Ps. aeruginosa* virulence prompted research into the use of flagella as protective immunogens. The organism normally has two types of flagellum and a divalent vaccine has been tested, but with only modest benefit. There has also been some interest in development of vaccines against pili, bacterial appendages used for attachment.

Some investigators tried the use of high-molecular-weight polysaccharides as potential vaccine candidates but interest in this area has declined. Another defunct area of research is the use of pseudomonal alginate and mucoid exopolysaccharide; these were suggested for use in cystic fibrosis patients but did not progress beyond *animal* studies.

From the 1980s, there was considerable interest in the use of a variety of outer membrane proteins to develop a vaccine, partly because outer membrane proteins are exposed on the cell surface and at least one, protein F, is common to all serotypes. Encouraging results were obtained in *animal* models of infected burns and of chronic lung disease. Preliminary studies in healthy humans yielded large and sustained increases in antibody titres and found outer membrane proteins to be well tolerated. Multicomponent vaccines have been developed consisting of toxoids of known pseudomonal virulence factors such as proteases, elastases, and exotoxin A. Conjugate vaccines have been shown to be effective in *animal* models and to elicit a high antibody titre in cystic fibrosis patients.

In recent years, attention has also turned to the development of DNA vaccines, and to the use of some novel immunological approaches such as the use of pooled monoclonal antibodies directed against a variety of *Ps. aeruginosa* virulence antigens and of epitopes of pseudomonal elastase. In addition, research has shown that both active and passive immunisation with the purified type III translocation protein (PcrV) from *Ps. aeruginosa* is effective in *mouse* models of lung infection and burns, although results of combined active and passive immunisation in clinical studies were disappointing. Finally, there has been interest in obtaining immunological protection by presenting *Pseudomonas* antigens via mucous membranes, particularly in the gastrointestinal tract or intranasally.

Q Fever Vaccines

Vacunas de la fiebre Q.

Profile

A Q fever vaccine consisting of a purified killed suspension of *Coxiella burnetii* is available in Australia. It is prepared from Phase I Henzerling strain of *C. burnetii* grown in the yolk sacs of embryonated eggs. A single 0.5-mL subcutaneous dose is given for active immunisation in individuals at high risk of Q fever. These include abattoir workers, veterinarians, farmers and others exposed to farm animals, and laboratory workers handling potentially infected tissue.

Before immunisation, patients should be tested for their serum antibody titre and a skin test performed; giving the vaccine to persons already sensitised to Q fever antigens may cause serious hypersensitivity reactions.

Preparations

Proprietary Preparations (details are given in Part 3)
Austral.: Q-Vax.

Rabies Antisera

Antisuero de la rabia.

ATC — J06AA06.

Profile

Rabies antisera have been used to provide passive immunisation against rabies but the use of rabies immunoglobulins (see below) is preferred.

Rabies Immunoglobulins

Inmunoglobulinas contra la rabia.

ATC — J06BB05.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Human Rabies Immunoglobulin; Immunoglobulinum Humanum Rabicum). A liquid or freeze-dried preparation containing human immunoglobulins, mainly immunoglobulin G (IgG). It is obtained from plasma from donors immunised against rabies and contains specific antibodies that neutralise the rabies virus. Normal immunoglobulin may be added. It contains not less than 150 international units/mL. The liquid preparation should be stored, protected from light, in a colourless, glass container. The freeze-dried preparation should be stored, protected from light, in a colourless, glass container, under vacuum or under an inert gas.

USP 31 (Rabies Immune Globulin). A sterile solution of globulins derived from plasma or serum from selected adult human donors who have been immunised with rabies vaccine and have developed high titres of rabies antibody. It contains 10 to 18% of protein of which not less than 80% is monomeric immunoglobulin G. It has a potency of 150 international units/mL. It contains glycine as a stabilising agent, and a suitable preservative. A solution diluted to contain 1% of protein has a pH of 6.4 to 7.2. It should be stored at 2° to 8°.

Adverse Effects and Precautions

As for immunoglobulins in general, p.2201.

Uses and Administration

Rabies immunoglobulins are used for passive immunisation against rabies. They are combined with active immunisation by rabies vaccines (see below) in postexposure treatment for the prevention of rabies in previously unimmunised persons who have been bitten by rabid animals or animals suspected of being rabid. There are 2 types of immunoglobulin available: human rabies immunoglobulin (HRIG) and pepsin-digested or highly purified equine rabies immunoglobulin (ERIG). The recommended dose of HRIG is 20 international units/kg; for ERIG products it is 40 international units/kg. The recommended dose should be infiltrated in and around the cleansed wound; if infiltration of the whole volume is not possible, any remaining immunoglobulin should be given intramuscularly (in the anterolateral thigh and not the gluteal region) at a different site to that at which the vaccine was given.

Preparations

Ph. Eur.: Human Rabies Immunoglobulin;
USP 31: Rabies Immune Globulin.

Proprietary Preparations (details are given in Part 3)

Rabies Vaccines

Vacunas de la rabia.

ATC — J07BG01.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Rabies Vaccine for Human Use Prepared in Cell Cultures; Vaccinum Rabiei ex Cellulis ad Usum Humanum; Rabies Vaccine BP 2008). A sterile freeze-dried suspension of inactivated rabies virus; a suitable strain is grown in an approved cell culture. The cell-culture medium may contain suitable antibacterials at the smallest effective concentration. The vaccine is prepared immediately before use by the addition of a suitable sterile liquid. The estimated potency is not less than 2.5 international units per dose. The dried vaccine should be stored at 2° to 8° and be protected from light.

The BP 2008 states that Rab may be used on the label.

USP 31 (Rabies Vaccine). A sterile preparation, in dried or liquid form, of inactivated rabies virus obtained from inoculated diploid cell cultures. It has a potency of not less than 2.5 international units per dose. It should be stored at 2° to 8°.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Patients receiving human diploid-cell or purified chick embryo-cell rabies vaccines may experience pain, erythema, and induration at the injection site. Systemic reactions including abdominal pain, diarrhoea, nausea and vomiting, headache, chills, dizziness, fever, malaise, convulsions, encephalitis, lymphadenopathy, arthralgia and myalgia, dyspnoea and wheezing, or rash may also occur. Reactions may become more severe with repeated doses. Hypersensitivity reactions including anaphylaxis occur more commonly with vaccines prepared from non-human sources than with human diploid-cell vaccine. However, these reactions have also been associated with the presence of β-propiolactone-altered human albumin in the human diploid-cell vaccine.

Neurological reactions (meningoencephalitis, meningoencephalomyelitis, mononeuritis multiplex, transverse myelitis, or ascending paralysis) have been associated with the use of animal nerve-tissue vaccines. WHO considers that nerve-tissue vaccines should no longer be used. There are only isolated reports of neurological reactions after use of human diploid-cell vaccines.

Patients known to be hypersensitive to a particular vaccine or its components should be given an alternative product if available, although there are no absolute contra-indications to postexposure treatment. Pre-exposure prophylaxis should be delayed in patients with febrile illness until fever has resolved.

Effects on the nervous system. Rabies vaccines were originally prepared from infected animal brain tissue. The incidence of neurological complications with these vaccines was about 1 in 1 600, with an overall mortality of 15%.[1] Neurological adverse effects were attributed to myelin basic proteins present in these vaccines.[1-4] Subsequently, a highly immunogenic rabies vaccine was produced from the relatively myelin-free nerve tissue of suckling mice. However, neuroparalytic complications were reported in about 1 in 8 000 persons treated.[1,5] Most of these complications were of a Guillain-Barré-type illness, and had a fatality rate of 20 to 50%.[1]

Neuroparalytic reactions occur less frequently (1 in 32 000 persons treated) with vaccines prepared from duck embryo tissue;[1,5] however, these vaccines are no longer manufactured.[5]

Cell-derived rabies vaccines have been developed with better safety profiles.[1,5,6]

Isolated cases of neuroparalytic reactions have been reported with human diploid-cell or chick embryo-cell vaccines, mostly manifesting as a Guillain-Barré-type illness.[1,7-10]

Hypersensitivity. Systemic hypersensitivity reactions[1] have occurred in up to 6% of patients receiving booster immunisation with human diploid-cell rabies vaccine (HDCV), with onset after 2 to 21 days. Presenting features include generalised or pruritic rash or urticaria, angioedema, arthralgias, fever, nausea, and vomiting. These reactions have been linked to the presence of β-propiolactone-altered human albumin in HDCV. A lower risk of hypersensitivity reaction should exist with newer cell-derived vaccines that contain little or no human albumin, such as purified chick embryo cell rabies vaccines (PCECV) or purified Vero-cell rabies vaccines (PVRV). A review[2] noted that patients receiving booster immunisation with PCECV did not generally exhibit systemic hypersensitivity reactions. In a comparison study[3] involving 400 children, patients receiving a new chromatographically purified Vero-cell vaccine were found to have a lower incidence of systemic hypersensitivity (0.7%) than those in the HDCV group (1.2%) after booster immunisation.

Spongiform encephalopathies. Possible transmission of Creutzfeldt-Jakob disease associated with sheep-brain rabies vaccine has been reported from India.[1] It was suggested that transmission of the abnormal prion protein from sheep with scrapie might be implicated.

Interactions

As for vaccines in general, p.2202.

Antimalarials. Studies have suggested that continuous antimalarial chemoprophylaxis with *chloroquine* during primary immunisation with human diploid-cell rabies vaccine, given intradermally for pre-exposure prophylaxis, may be associated with a poor antibody response.[1,2] WHO[3] recommends that people currently taking malaria prophylaxis or those unable to complete the 3-dose rabies pre-exposure regime before starting malaria prophylaxis should receive pre-exposure rabies vaccination by the intramuscular route instead.

Uses and Administration

Rabies vaccines are used for active immunisation against rabies. They are used as part of postexposure treatment to prevent rabies in patients who have been bitten by rabid animals or animals suspected of being rabid. Infection does not take place through unbroken skin but is possible through uninjured mucous membranes and has been reported after the inhalation of virus in the laboratory. Rabies vaccines are also used for pre-exposure prophylaxis against rabies in persons exposed to a high risk of being bitten by rabid or potentially rabid animals.

Schedules for prophylaxis and treatment of rabies are recommended by WHO (see Pre-exposure Immunisation, below) and many countries have immunisation schedules based on these.

In the UK, two types of rabies vaccine are available. The first type is prepared from inactivated Wistar rabies virus strain PM/WI38 1503-3M cultured on human diploid cells, and the second type is prepared from inactivated Flury LEP virus strain produced on purified chick embryo cells. Each contains not less than 2.5 international units/mL. The purified chick embryo-cell vaccine is given intramuscularly into the deltoid region in adults but into the anterolateral aspect of the thigh in children. The human diploid-cell vaccine is given intramuscularly into the deltoid region in both adults and children. Other cell culture-derived vaccines, such as Vero cell rabies vaccine, are available in other countries.

For **pre-exposure prophylaxis** against rabies, the recommended schedule in the UK is 3 doses, each of 1 mL, by intramuscular injection on days 0, 7, and 28; the third dose may in some instances be given on day 21 if there is insufficient time before travel. For persons at regular and continuous risk, a single reinforcing dose should be given 1 year after completion of the primary course with further doses at 3- to 5-year intervals. For those at intermittent risk, a booster dose should be given from 2 years after completion of the primary course.

For **postexposure treatment**, thorough cleansing of the wound with soap and water is imperative. The recommended schedule in the UK for unimmunised or incompletely immunised persons is 5 doses, each of 1 mL, by intramuscular injection on days 0, 3, 7, 14, and 30. In fully immunised persons two doses of vaccine should be given intramuscularly, one each on day 0 and day 3. Vaccination should be started as soon as possible after exposure, and may be stopped if it is proved that the patient was not at risk. In previously unimmunised patients at high risk, rabies immunoglobulin (see above) should also be given at the same time as the first dose of vaccine.

Rabies. Rabies is caused by infection with a rhabdovirus of the genus Lyssavirus. Rabies has a worldwide distribution, primarily in domesticated and wild dogs but also in bats and other warm-blooded animals, although some countries, including the UK, most of Australasia, and Antarctica are designated as rabies-free areas. Transmission of the rabies virus to humans is usually by the bite of an infected animal or contamination of broken skin by saliva. Infection is possible via intact mucous membranes and by aerosol transmission, but infection is unlikely after contamination of intact skin. Other body fluids such as urine and tears should be regarded as potentially infectious; rabies virus transmission has also been reported after organ transplantation from misdiagnosed donors.

Human rabies is almost always fatal once symptoms have appeared. The incubation period varies from 2 weeks to 6 years (average of 2 to 3 months) depending on the distance of the bite site from the brain and the amount of virus in the inoculum. There are 2 types of clinical presentations of rabies; encephalitic (furious) and paralytic (dumb). Encephalitic rabies presents with periods of hyperexcitability accompanied by severe agitation and bizarre behaviour alternating with periods of lucidity. Severe spasms of the larynx and pharynx may be provoked by attempts at swallowing (leading to hydrophobia) or by air blown at the face (aerophobia). Other symptoms include hypersalivation, fever, and convulsions. In the paralytic form, progressive flaccid paralysis develops in the bitten limb and ascends in a symmetrical or asymmetrical manner. Patients not dying through respiratory or cardiac arrest during the acute phase may develop any of a number of complications culminating in coma and death or (very rarely) recovery; only a few patients are documented as having survived after the onset of coma, and all had received either pre- or postexposure immunisation.

National control programmes involve epidemiological surveillance, mass canine immunisation campaigns, and dog population management. The development of oral animal vaccines delivered on baited food has met with considerable success in a number of areas and has become an essential tool for eliminating rabies in wild animals. Rigorously applied controls of international transfer of animals including certification of vaccination and quarantine for animals entering rabies-free areas are necessary to prevent re-introduction of rabies.

Although a number of treatments have been tried including antivirals, interferons, high doses of rabies immunoglobulin, and corticosteroids, none has shown evidence of effectiveness. Postexposure treatment after contact with a suspected or confirmed rabid animal may be effective in preventing death; it includes prompt and thorough cleansing of the contaminated site and the early use of rabies vaccine with or without rabies immunoglobulins. For a brief outline of postexposure treatment, see below.

Pre-exposure prophylaxis is recommended in persons at high risk of exposure, either due to their occupation or those travelling in enzootic areas. The main obstacle to mass pre-exposure vaccination appears to be the high cost of cell culture vaccines. See under Pre-exposure Immunisation (below) for outlines of recommended vaccination schedules.

CHOICE OF VACCINES. Many different rabies vaccines are available for human use. Some are derived from nerve tissue of animals, some from avian tissues (duck embryos), and some prepared in cell cultures. The first rabies vaccine was based on attenuated virus from desiccated nerve tissue. Later, inactivated nervous tissue-derived vaccines were prepared from rabid sheep, goat (Semple vaccines) or suckling mouse brains (Feunzalida Palacios vaccine). A complete postexposure treatment course of nerve-tissue vaccine consists of up to 23 injections and is associated with severe neurological reactions and a significant failure rate. WHO therefore strongly recommends that nerve-tissue vaccines should not be used, and that production should be stopped. Cell-derived rabies vaccines were subsequently developed; the human diploid cell rabies vaccine (HDCV) was introduced in 1967 and later less expensive purified chick embryo-cell vaccine (PCECV) and purified Vero-cell rabies vaccines (PVRV) entered use. There appears to be little difference in terms of safety and antigenicity between HDCV, PCECV, and PVRV in recommended regimens. The incidence of severe hypersensitivity reactions should, however, be lower with PVRV and PCECV than with HDCV since the purification process removes most human serum albumin in the cell-growth medium before virus inactivation (see Hypersensitivity, under Adverse Effects and Precautions, above). A purified duck-embryo vaccine (PDEV) provided similar efficacy and safety to vaccines produced from cell cultures, but is no longer manufactured.

There is little data concerning the efficacy of rabies vaccines. It appears that nerve-tissue vaccines afford limited protection after minor exposures to rabies virus, are less effective after head bites, and are of little use after very severe exposures. Failure rates for HDCV, PCECV, and PVRV (including cases with less than the recommended therapy) have been estimated as less than 1 in 80 000 treatments in the USA, Canada, and Europe, 1 in 12 000 to 20 000 in Thailand, and 1 in 30 000 in the remaining tropical countries. Reported failures of these vaccines are usually associated with severe lesions on or near the head and/or errors in treatment, such as deviation from recommendations, incorrect site of vaccine administration, or delay in treatment. WHO recommends a minimum potency of 2.5 international units per intramuscular dose for all cell-derived rabies vaccines.

The cost of cell-derived rabies vaccines is prohibitively high in the developing world. Although the adverse effects of nerve-tissue vaccines preclude their use for pre-exposure prophylaxis, they are still used in some countries for postexposure prophylaxis. WHO is anxious that nerve-tissue vaccines should be replaced with affordable cell-derived vaccines as soon as possible. In the meantime, cost-cutting regimens have been devised for use of cell-derived rabies vaccines by the intradermal route. Rapid immunisation is achieved by the use of several sites of injection; fewer injections are required than with traditional intramuscular regimens.

Pre-exposure immunisation. WHO[1,2] has developed guidelines as to who should receive pre-exposure vaccination with rabies vaccines. However, national policies may vary somewhat from that of WHO, depending on the local risk of contracting rabies and the vaccines available; it is generally recommended for use in persons at high risk of infection with rabies virus. Where available, the vaccines produced in cell culture or from purified embryonated eggs are preferred over the vaccines produced in animal tissues (see under Choice of Vaccine, above). WHO recommends[1,2] pre-exposure prophylaxis for persons regularly at high risk of exposure, such as certain laboratory workers, veterinarians, animal handlers, and wildlife officers, and those living in or travelling to areas where rabies is endemic (particularly in children under 15 years of age). The immunisation schedule should preferably consist of 3 injections of a rabies vaccine of potency at least 2.5 international units given on days 0, 7, and either day 21 or 28, but variation of a few days is unimportant. Vaccine should be given into the deltoid area of the arm or for young children into the anterolateral area of the thigh. Titres of virus-neutralising antibodies can be checked in serum samples collected 1 to 3 weeks after the last dose. Those who work with the live virus should have their antibody titres checked every 6 months and if the figure falls below 0.5 international units/mL they should receive a booster.[1,2] Other individuals at continuing risk should have their titres checked every 12 months and a booster given if the titre is below 0.5 international units/mL.[1]

WHO also suggests intradermal use of rabies vaccine in doses of 0.1 mL on days 0, 7, and either day 21 or 28 but intramuscular injection is preferable and is mandatory in those taking malaria prophylaxis.

In the UK,[3] the schedule for immunisation (see Uses and Administration, above) is similar to that recommended by WHO.

In the USA, immunisation with a human diploid cell vaccine, a vaccine adsorbed onto an aluminium salt, or a purified chick embryo cell vaccine is carried out similarly to the WHO schedule, with serum-antibody titres determined every 6 months to 2 years, depending upon the level of exposure, and booster doses given as necessary.[4]

Postexposure treatment. WHO guidelines[1,2] emphasise the importance of prompt local treatment for all bite wounds and scratches that may be contaminated with rabies virus and that, depending on the category of animal contact, rabies vaccine on its own or with rabies immunoglobulin should be given. The combination of these measures immediately after exposure is considered to guarantee almost complete protection. Pregnancy and infancy are not contra-indications to postexposure vaccination. These measures should be instituted even in patients who present months after having been bitten.

First aid or local treatment consists of immediate thorough flushing and washing of the wound with water, or soap and water, or detergent followed by the application of alcohol 70% or tincture or aqueous solution of iodine. Medical care may then consist of the instillation of rabies immunoglobulin into the depth of the wound and infiltration around the wound. Ideally the wound should not be sutured, but if suturing is necessary then it is essential that it be preceded by rabies immunoglobulin as above. Antimicrobials and tetanus vaccine may also be given as necessary.

The use of rabies vaccine and of rabies immunoglobulin depends on the category of animal contact. WHO classifies the type of contact with a suspect or rabid animal into 3 categories:

- category I covers touching or feeding of animals and licks on intact skin
- category II covers nibbling of uncovered skin, minor scratches or abrasions without bleeding, and licks on broken skin
- category III covers single or multiple transdermal bites or scratches and contamination of mucous membranes with the animal's saliva

Generally no treatment is required for category I contact. Patients who have had category II contact should be given rabies vaccine but the course may be stopped if the contact has been with a cat or dog that remains healthy throughout an observation period of 10 days or if postmortem study of the contact animal shows it to be negative for rabies. Patients with category III contact should be given rabies vaccine preceded by rabies immunoglobulin infiltrated around the wound and instilled into it as described above.

There are 2 types of immunoglobulin available; human rabies immunoglobulin (HRIG) and pepsin-digested or highly purified equine rabies immunoglobulin (ERIG). The recommended dose for HRIG is 20 international units/kg and for ERIG products is 40 international units/kg. As much as possible of the dose should be infiltrated into and around the wound, with the remainder being injected intramuscularly into a site remote from that where vaccine was given, such as the anterior thigh.

The potency of rabies vaccines should be at least 2.5 international units per single human dose. For intramuscular vaccination schedules one dose should be given on days 0, 3, 7, 14, and 28 into the deltoid region or, for small children, into the anterolateral area of the thigh. An abbreviated multisite intramuscular schedule (the 2-1-1 regimen) induces an early antibody response and may be particularly effective when postexposure treatment has not included a rabies immunoglobulin. This schedule consists of one dose given in the right arm and one in the left arm on day 0, and one dose intramuscularly into the deltoid region on days 7 and 21.

Intradermal vaccination reduces the volume of injection required and is therefore suited to situations where vaccine or money is in short supply. For intradermal vaccination one dose (0.1 mL) of purified chick embryo-cell or purified Vero-cell vaccine may be given at each of two sites, usually the left and right upper arm, on days 0, 3, 7, and 28. Alternatively, in emergency situations when no rabies immunoglobulin is available, either human diploid cell or purified chick embryo-cell rabies vaccine may be given intradermally in one dose at each of 8 sites on day 0, in one dose at 4 sites on day 7, and subsequently in one dose at one site on days 28 and 90.

For postexposure treatment of previously vaccinated patients, WHO recommends local treatment of wounds followed by rabies vaccine given on days 0 and 3, either as a standard intramuscular dose or as one intradermal dose per site. No rabies immunoglobulin should be given. Patients who previously received vaccines of unproven potency or who have failed to develop an acceptable rabies neutralising antibody titre should be given full treatment as for those previously unimmunised.

In the UK,[3] rabies immunoglobulin is given if the patient is previously unimmunised and at high risk. Vaccine is given on days 0, 3, 7, 14, and 30 (five doses) in unimmunised persons (although the UK licensed product information for human diploid cell vaccine also recommends a sixth dose on day 90); two doses, one each on day 0 and day 3 are given to previously fully immunised persons.

In the USA, a human diploid-cell vaccine, an adsorbed rabies vaccine, or a purified chick embryo cell vaccine may be used for postexposure treatment.[4] In previously unimmunised individuals, a 1-mL dose of vaccine is given intramuscularly on days 0, 3, 7, 14, and 28, with rabies immunoglobulin as in the WHO schedule. In previously immunised individuals, two doses of vaccine are given on days 0 and 3, and rabies immunoglobulin is not required.

Respiratory Syncytial Virus Immunoglobulins

Inmunoglobulinas contra el virus sincitial respiratorio.

Palivizumab *(BAN, rINN)*

Palivitsumabi; Palivizumabum. immunoglobulin G 1 (human-mouse monoclonal MEDI-493 γ1-chain antirespiratory syncytial virus protein F), disulfide with human-mouse monoclonal MEDI-493 κ-chain, dimer.

Паливизумаб

CAS — 188039-54-5.

ATC — J06BB16.

Adverse Effects and Precautions

As for immunoglobulins in general, p.2201.

Interactions

As for immunoglobulins in general, p.2201.

There is some evidence that antibody responses to diphtheria, tetanus, pertussis, and Haemophilus influenzae vaccines may be reduced in infants also receiving respiratory syncytial virus immunoglobulins.

Uses and Administration

Respiratory syncytial virus immunoglobulin is available in some countries for the passive immunisation of infants against lower respiratory-tract infections caused by RSV. It is prepared from the pooled plasma of adults selected for high titres of antibodies that neutralise the virus. Each mL of respiratory syncytial virus immunoglobulin contains about 50 mg of protein.

In the USA, children under 2 years of age with chronic lung disease (bronchopulmonary dysplasia) or a history of premature birth may receive a prophylactic intravenous infusion once a month during the RSV season (typically November to April or early May). The drug is given in a dose of up to 750 mg/kg at an initial rate of 75 mg/kg per hour for 15 minutes, followed by 180 mg/kg per hour until the end of the infusion.

Palivizumab, a human monoclonal antibody to RSV, is available in some countries and is used intramuscularly for similar purposes, in a dose of 15 mg/kg monthly. Palivizumab is also recommended in children under 2 years of age with haemodynamically significant congenital heart disease. Children undergoing cardiac bypass should be given an extra dose of palivizumab as soon as they are stable after surgery; doses are subsequently resumed monthly thereafter.

◊ The American Academy of Pediatrics has issued revised indications for the use of palivizumab and respiratory syncytial virus immunoglobulin.[1] Palivizumab or respiratory syncytial virus immunoglobulin prophylaxis should be considered for infants younger than 2 years of age with chronic lung disease (bronchopulmonary dysplasia) who have required medical therapy for their condition within 6 months of the anticipated start of the RSV season. Infants born at 32 weeks' gestation or earlier may benefit from prophylaxis even if they do not have chronic lung disease. Although prophylaxis has been shown to reduce hospitalisation for infants born between 32 and 35 weeks' gestation, the cost for this large group of infants should be considered carefully. Palivizumab, may in addition be given to children under 2 years of age with haemodynamically significant congenital heart disease.

Both palivizumab and respiratory syncytial virus immunoglobulin have been shown to decrease the risk of severe RSV infection in high-risk infants and children. Palivizumab is preferred over respiratory syncytial virus immunoglobulin for most high-risk children because of its comparative ease of administration, safety, and efficacy. Monthly use of palivizumab during the RSV season results in a 45 to 55% reduction in hospitalisation. Although palivizumab is usually preferred, respiratory syncytial virus immunoglobulin may also decrease the incidence of other respiratory-tract infections in addition to those caused by RSV, and this may be of benefit for infants younger than 6 months who are not eligible for influenza immunisation and those with severe pulmonary disease who may be more prone to other respiratory-tract infections. Palivizumab has not been shown to affect the rate of hospitalisation for non-RSV infections or the incidence of otitis media.

Respiratory Syncytial Virus Vaccines

Vacunas del virus sincitial respiratorio.

Profile

Vaccines containing RSV protein subunit are being studied for active immunisation.

◊ Development of an effective and safe vaccine against RSV has been hampered by a number of factors.[1-3] The target population for a vaccine is mainly young infants who may not respond adequately to vaccination owing to the antigenic diversity of RSV, immunological immaturity, or the presence of maternal antibodies. In the early 1960s, a formalin inactivated respiratory syncytial virus vaccine known as FI-RSV (also sometimes called Lot 100) was tested in infants and children aged 2 months to 7 years but failed to protect against subsequent infection with wild-type virus; it also led to a catastrophically exaggerated clinical response to wild-type virus in infants who were naive to RSV before vaccination, resulting in hospitalisation for the majority of recipients and 2 fatalities. Since that time, a number of candidate vaccines have subsequently been developed including live attenuated virus and viral protein subunit vaccines.[1,2] Several of the live attenuated vaccine candidates have been investigated in humans but results have generally been disappointing. More recently, genetically engineered live attenuated vaccine candidates have been generated, and some are currently being investigated in clinical studies.[1,2]

Subunit vaccines are composed of the F and G glycoproteins from RSV since these are the glycoproteins that induce antibody responses.[1,2] They are most likely to be of use in older persons and in high-risk children and might also be used for maternal immunisation. A chimeric FG fusion protein vaccine was evaluated in phase I studies but is no longer in development.

Rift Valley Fever Vaccines

Vacunas de la fiebre del valle del Rift.

Profile

An inactivated rift valley fever vaccine has been developed for the active immunisation of persons at high risk of contracting the disease.

Rotavirus Vaccines

Vacunas de rotavirus.
ATC — J07BH01; J07BH02.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

The most common adverse effects reported in subjects receiving rotavirus vaccines (attenuated human strain or pentavalent reassortant rotavirus vaccine) are fever, fatigue, irritability, and gastrointestinal disturbances. Otitis media, nasopharyngitis, bronchospasm, and haematochezia (blood in the stools) have also been reported with the pentavalent vaccine. A few cases of Kawasaki disease have been reported with the pentavalent vaccine but no causal relationship has been established.

There has been much debate on the causal role of rotavirus vaccines for intussusception (see below); cases have been reported during post-marketing use.

The UK licensed product information for the attenuated human strain vaccine contraindicates the use of this vaccine in children with a history of intussusception or with congenital conditions of the gastrointestinal tract, while the US licensed product information for pentavalent vaccine advises that it be used with caution. Caution is also generally advised in those with gastrointestinal illnesses or growth retardation and use may be postponed in children suffering from diarrhoea or vomiting. Use of a rotavirus vaccine should be carefully considered before being given to infants with a close family contact who is immunocompromised; if given precautions should be taken to avoid transmission of any excreted vaccine virus.

Intussusception. A live oral tetravalent vaccine (RRV-TV) became available in the USA in August 1998 but was withdrawn from the market by the manufacturer in October 1999 after reports of intussusception (a condition when part of the intestine prolapses into the lumen of an adjacent part causing an obstruction). From September 1998 until July 1999, 15 patients with intussusception had been reported to the Vaccine Adverse Event Reporting System (VAERS), 12 of whom developed symptoms within a week of vaccination.[1] While this evidence was considered inconclusive, further studies were expected to clarify the risks associated with routine use of this vaccine. One such study,[2] in which 429 infants with intussusception were retrospectively analysed, found that 74 (17.2%) had received RRV-TV compared with 226 of 1763 controls (12.8%) and concluded that there was evidence of a causal relationship with the vaccine. Another retrospective study,[3] however, found that there was no evidence of an increase in hospital admissions due to intussusception during the period of RRV-TV availability and recommended that a large, randomised, double-blind vaccine trial be performed to determine the absolute risk. Further analysis of the incidence of intussusception associated with RRV-TV has prompted discussion as to whether the absolute risk might in fact be sufficiently low that withholding the vaccine results in greater mortality than would be caused by intussusception.[4] Reassessment of the data on RRV-TV and intussusception has suggested that the risk for intussusception was age-dependent; relative risk for intussusception following the first dose of RRV-TV increased with increasing age.[5,6] However, WHO Global Advisory Committee on Vaccine Safety found that there was insufficient evidence available to determine whether use of RRV-TV before 60 days of age was associated with a lower risk for intussusception but confirmed the association of a high risk of intussusception in infants immunised after day 60.[7] Such considerations have implications for the ongoing evaluation of other candidate live attenuated rotavirus vaccines in that, should cases of intussusception occur, a decision might be required as to what constitutes an acceptable rate.[4]

From February 2006 until February 2007, 35 patients with confirmed intussusception had been reported to VAERS following vaccination with the pentavalent reassortant vaccine; 17 of whom developed symptoms within 21 days of vaccination, including 11 that occurred within 7 days of vaccination. However, this number of cases is not higher than the age adjusted background rates for intussusception.[8]

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Several live oral rotavirus vaccines for use in the prevention of childhood diarrhoea have been developed and some are now licensed.

A live attenuated oral monovalent rotavirus vaccine (based on the human RIX4414 strain) is available in some countries. Two doses are given, the first at 6 weeks of age onwards and the subsequent dose at least 4 weeks later; the course should preferably be given before 16 weeks of age, but must be completed by the age of 24 weeks. A live oral pentavalent reassortant rotavirus vaccine (based on human and bovine strains) is available in the USA. Three doses are given, the first at 6 to 12 weeks of age and the two subsequent doses at 4- to 10-week intervals; the third dose should not be given after 32 weeks of age.

A live oral tetravalent rotavirus vaccine (RRV-TV) was formerly available in the USA but was withdrawn by the manufacturer in October 1999 after reports of intussusception associated with its use.

Vaccine development. Rotaviruses are an important cause of severe diarrhoea in both developed and developing countries (see Gastro-enteritis, p.850); rates of illness are similar in both and improvement in water quality and general hygiene does not have much effect on viral transmission. The disease infects almost all children before the age of 5 years but is most severe among children 3 to 35 months of age.[1,2] Human rotavirus diarrhoea is caused by group A, B, or C rotaviruses.[3] While an initial infection does not produce complete immunity, it does appear to be protective against further severe gastroenteritis. Vaccination therefore aims to produce a similar effect.[1,2] Development of a suitable vaccine has been made difficult by the diversity of rotaviruses.[3] Initial attempts at vaccine development used single bovine or rhesus monkey strains but these were associated with variable efficacy and adverse effects.[4-6]

To overcome these problems reassortant rotavirus (RRV) strains were constructed. These combined animal rotavirus strains with human rotavirus genes coding for serotype-specific antigens, enabling polyvalent vaccines to be produced against the major rotavirus serotypes causing disease. A number of such candidate vaccines are under development[7] and some are now licensed.[8] Guidelines have been developed in the USA for the use of rotavirus vaccine.[1,2]

Rubella Immunoglobulins

Inmunoglobulinas contra la rubéola.
ATC — J06BB06.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii), have monographs.

Ph. Eur. 6.2 (Human Rubella Immunoglobulin; Immunoglobulinum Humanum Rubellae). A liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). It is obtained from plasma containing specific antibodies against the rubella virus. Normal immunoglobulin may be added. It contains not less than 4500 international units/mL. Both the liquid and freeze-dried preparations should be stored, protected from light, in a colourless, glass container. The freeze-dried preparation should be stored under vacuum or under an inert gas.

Adverse Effects and Precautions

As for immunoglobulins in general, p.2201.

Interactions

As for immunoglobulins in general, p.2201.

Uses and Administration

Rubella immunoglobulins may be used for passive immunisation against rubella (German measles). They have been used to prevent or modify rubella in susceptible persons.

Preparations

Ph. Eur.: Human Rubella Immunoglobulin.

Rubella Vaccines

Vacunas de la rubéola.
ATC — J07BJ01.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Rubella Vaccine (Live); Vaccinum Rubellae Vivum). A freeze-dried preparation of a suitable live attenuated strain of rubella virus grown in human diploid cell cultures. It is reconstituted immediately before use. The cell-culture medium may contain a permitted antibacterial at the smallest effective concentration, and a suitable stabiliser may be added to the bulk vaccine. The final vaccine contains not less than 3.0 log $CCID_{50}$ per dose. The dried vaccine should be stored at 2° to 8° and be protected from light.

The BP 2008 states that Rubella may be used on the label.

USP 31 (Rubella Virus Vaccine Live). A bacterially sterile preparation of a suitable live strain of rubella virus grown in cultures of duck-embryo tissue or human tissue. It contains the equivalent of not less than 1×10^3 $TCID_{50}$ in each immunising dose. It should be stored at 2° to 8° and be protected from light.

Adverse Effects

As for vaccines in general, p.2201.

Generally, adverse effects have not been severe. Those occurring most commonly are skin rashes, pharyngitis, fever, and lymphadenopathy; arthralgia and arthritis may also occur. Thrombocytopenia (including idiopathic thrombocytopenic purpura) has been reported rarely.

Effects on bones and joints. Although acute arthralgia or arthritis occurs in up to 30% of women after rubella vaccination,[1] a retrospective analysis found no evidence of an increased risk of chronic arthropathies.[2]

1. Tingle AJ, *et al.* Randomised double-blind placebo-controlled study on adverse effects of rubella immunisation in seronegative women. *Lancet* 1997; **349:** 1277–81.
2. Ray P, *et al.* Risk of chronic arthropathy among women after rubella vaccination. *JAMA* 1997; **278:** 551–6.

Effects on hearing. For a report of irreversible sensorineural deafness associated with use of measles and rubella vaccine, see p.2223.

Effects on the nervous system. For a report of optic neuritis in 2 children after use of measles and rubella vaccine, see under Adverse Effects of Measles and Rubella Vaccines, p.2223.

Precautions

As for vaccines in general, p.2202.

Rubella vaccines should not be given during pregnancy. In the UK it is recommended that patients should be advised not to become pregnant within 1 month of vaccination. However, no case of congenital rubella syndrome has been reported after the inadvertent use of rubella vaccines shortly before or during pregnancy and there is no evidence that the vaccines are teratogenic. Inadvertent use of rubella vaccines during pregnancy should not therefore result in a recommendation to terminate the pregnancy. There is no risk to a pregnant woman from contact with recently vaccinated persons as the vaccine virus is not transmitted.

Rubella vaccines are not generally recommended for children below the age of 1 year in whom maternal antibodies might prevent a response.

Vaccines may contain traces of neomycin and/or polymyxin and should therefore not be given to individuals with a history of anaphylaxis to these antibacterials.

Pregnancy. Since 1971 the US CDC has followed up women who received rubella vaccines within 3 months before or after conception.[1] Up to 1979 vaccines containing either the Cendehill or HPV-77 strains of rubella virus were available. None of the 290 infants born to the 538 women who had received these vaccines had defects indicative of congenital rubella syndrome; this included 94 live-born infants of women who were known to be susceptible to rubella before receiving the vaccine. In 1979 a rubella vaccine containing the Wistar RA 27/3 strain was introduced. None of 212 infants born live to 254 women known to be susceptible to rubella and who had received the RA 27/3 rubella vaccine from 1979 to 1988 had defects indicative of congenital rubella syndrome. These results are consistent with experiences in Germany[2] and the UK.[3,4] However, because of evidence that rubella vaccine viruses can cross the placenta and infect the fetus a theoretical risk to the fetus cannot be completely ruled out.[1] Thus in both the UK and USA pregnancy is considered a contraindication to rubella vaccination, and patients are also advised not to become pregnant within one month of vaccination. However, in neither country is termination of pregnancy recommended if the vaccine is inadvertently given during pregnancy.

4. Tookey PA, *et al.* Rubella vaccination in pregnancy. *Commun Dis Rep* 1991; **1** (review 7): R86–R88.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Rubella vaccines are used for active immunisation against rubella (German measles). The symptoms of rubella infection are generally mild except in the early stages of pregnancy when it leads to fetal damage in most infants.

For primary immunisation combined measles, mumps, and rubella vaccine (p.2223) is usually given. For discussion of immunisation schedules, see under Vaccines, p.2202.

Women of child-bearing age should also be vaccinated with the combined vaccine if they are seronegative; women who are found to be seronegative during pregnancy should be vaccinated in the early postpartum period. Effective precautions against pregnancy must be observed for at least one month after vaccination. To avoid the risk of transmitting rubella to pregnant patients, all health service staff, both male and female, should be screened and those found to be seronegative should be vaccinated.

In the USA and in many other countries, a single-antigen rubella vaccine is available although combined vaccines are usually preferred.

Preparations

Ph. Eur.: Rubella Vaccine (Live);
USP 31: Rubella Virus Vaccine Live.

Proprietary Preparations (details are given in Part 3)
Arg.: Imovax Rubeola†; Rudivax; ***Austral.:*** Ervevax; Meruvax II; ***Austria:*** Ervevax; Rubeaten; ***Braz.:*** Rudivax†; ***Cz.:*** Ervevax†; Rudivax†; ***Denm.:*** Meruvax†; ***Fr.:*** Rudivax; ***Ger.:*** Rubellovac†; ***Gr.:*** Vaccin Rubeole; ***Hong Kong:*** Rudivax†; ***India:*** R-Vac; ***Irl.:*** Ervevax†; ***Israel:*** Rudivax; ***Ital.:*** Ervevax†; Gunevax†; Rudivax†; ***Malaysia:*** Ervevax†; Gunevax†; ***Mex.:*** Ervevax; Gunevax†; ***NZ:*** Ervevax; ***Port.:*** Rubeaten†; Rudivax; ***Rus.:*** Ervevax (Эрвевакс); ***S.Afr.:*** Rudivax; ***Spain:*** Vac Antirrubeola†; ***Swed.:*** Meruvax†; ***Switz.:*** Ervevax†; Meruvax; Rubeaten; ***Thai.:*** Gunevax†; Rudivax†; ***UK:*** Almevax; ***USA:*** Meruvax II; ***Venez.:*** Imovax Rubeola†.

Rubella and Mumps Vaccines

Vacunas de la rubéola y la parotiditis.

ATC — J07BJ51.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

See also under Mumps Vaccines, p.2225, and Rubella Vaccines, above.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Rubella and mumps vaccines have been used for active immunisation although for primary immunisation a combined measles, mumps, and rubella vaccine (p.2223) is usually used. For discussion of immunisation schedules, see under Vaccines, p.2202.

Preparations

Proprietary Preparations (details are given in Part 3)
USA: Biavax II.

Schistosomiasis Vaccines

Bilharzia Vaccines; Vacunas de la esquistosomiasis.

Profile

Vaccines against schistosomiasis are under development.

◊ Despite attempts since the 1960s, development of an effective vaccine against schistosomiasis has proved difficult.[1,2] The worms themselves are not thought to be responsible for the disease but the eggs elicit a powerful and damaging immune response when they are trapped in tissue.

As only the very young in endemic areas will not have been exposed to schistosomiasis a protective antigen for a candidate vaccine must be one that will attack the adult parasite without cross reacting with egg antigens thus increasing the risk of developing chronic disease in those already affected. Most antigen vaccine candidates tested to date have at best resulted in 50 to 60% protection in animal models although repeated immunisation with irradiated cercariae in *murine* models has resulted in almost 80% protection. Consequently it has been questioned whether sterilising immunity should be the aim. It might be more realistic to develop a vaccine which can reduce the overall worm burden and the fecundity of surviving worms, thus reducing the number of eggs released and deposited in the liver. This in turn would lead to lower rates of infection by reducing the numbers of miracidia available to infect snails. Such a vaccine would, however, only be effective in terms of infection and morbidity rates after a considerable period of time, probably more than 20 years. Alternatively, vaccine candidates that specifically attack particular stages of the parasite life cycle might be feasible. A number of potential vaccine candidate antigens have been identified although the only vaccine candidate to have progressed to phase I and II clinical studies is the glutathione-*S*-transferase antigen from *S. haematobium*, Sh28 GST, and these studies are currently ongoing. Use of antigens with recombinant cytokines in order to enhance immune response, or with the B subunit of cholera toxin in order to suppress harmful inflammatory responses, is also being investigated. There is also some suggestion that it might be possible to develop a multicomponent vaccine consisting of multiple antigens that will give protection against different stages in the parasite cycle.[1]

Scorpion Venom Antisera

Antisuero contra el veneno de escorpión; Scorpion Antivenins; Scorpion Antivenoms.

Adverse Effects and Precautions

As for antisera in general, p.2201.

Uses and Administration

Some scorpion stings are dangerous and even fatal. The use of a scorpion venom antiserum suitable for the species of scorpion can prevent symptoms, provided that it is given with the least possible delay; other general supportive measures and symptomatic treatment are also needed. The effectiveness of scorpion venom antisera is disputed by some clinicians.

Scorpion stings. Scorpion stings are common throughout the tropics, but the most dangerous and potentially fatal species are found in India, North Africa and the Middle East, the southern states of North America and Mexico, Latin America and the Caribbean, and southern Africa. Local symptoms after scorpion stings include intense pain and swelling. Systemic symptoms result from excitation of nerve and muscle cells by the venom; the pattern of symptoms depends upon the species of scorpion. Symptoms such as hypersalivation, vomiting, and diarrhoea are generally followed by adrenergic features, with release of catecholamines producing hypertension, toxic myocarditis, arrhythmias, heart failure, and pulmonary oedema. The cardiotoxic effects are prominent features of stings in India, North Africa, and the Middle East. Neurotoxic effects such as fasciculations, spasms, and respiratory paralysis are seen with stings from North American species. Stings by the black scorpion of Trinidad may also produce pancreatitis.

Pain is treated with local infiltration or peripheral nerve block with local anaesthetics; opioid analgesics may be necessary, but are regarded as dangerous after stings by some North American species. An appropriate antiserum may be given as soon as possible after envenomation, although the effectiveness of some antisera has been questioned and in some countries they are no longer considered of benefit. Supportive treatment for cardiotoxic effects includes alpha blockers, calcium-channel blockers, and ACE inhibitors. The use of cardiac glycosides, beta blockers, and atropine is controversial. Phenobarbital has been suggested for neurotoxic effects.

Shigella Vaccines

Dysentery Vaccines; Shigellosis Vaccines; Vacunas contra Shigella.

Profile

Shigella vaccines have been under investigation since the 1960s but early prototypes were unsatisfactory. Live attenuated oral vaccines, parenteral conjugated vaccines, and intranasal vaccines are now also under development.

◊ Natural or experimental exposure to *Shigella* antigens has been shown to induce clinical immunity, and there has been some work towards developing an effective vaccine.[1,2] There have been 3 main approaches to vaccination under investigation.[1] Firstly, workers at the USA National Institutes of Health have developed a series of vaccines in which the O antigen of *S. sonnei*, *S. flexneri* 2a strain, or *S. dysenteriae* type 1 is conjugated to *Pseudomonas aeruginosa* recombinant exoprotein A. These vaccines are given intramuscularly and have elicited strong immune responses in adults and children tested, and some have reached phase III studies. A second approach has been to deliver *Shigella* lipopolysaccharide intranasally in proteasomes, which are purified outer membrane proteins that form a multimolecular vesicular complex around the antigen; these vaccines are being tested in phase I studies. The third approach is the use of live attenuated oral vaccines, attenuated by creating deletions in genes that govern vital metabolic processes within the organism or by mutating genes that encode specific virulence factors.

A major challenge in the development of a shigella vaccine is to provide protection against all of the numerous serotypes that appear epidemiologically important. Most experts agree that for a shigella vaccine to be totally effective globally it must protect against *S. dysenteriae* type 1, *S. sonnei*, and all 15 classical *S. flexneri* serotypes. However, it has been shown that a composite of 3 *S. flexneri* serotypes (2a, 3a, and 6) can provide cross protection against the remaining 12. Hence the ultimate plan is to develop a pentavalent vaccine comprising these 3 *S. flexneri* serotypes together with *S. sonnei* and *S. dysenteriae* type 1.[1] Shigella vaccines have been licensed for use in China.[2]

Smallpox Vaccines

Vacunas de la viruela.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Smallpox Vaccine (Live)). A liquid or freeze-dried preparation of live vaccinia virus grown in the membranes of the chick embryo, in cell cultures, or in the skin of living animals. The cell culture medium may contain suitable antibacterials at the lowest effective concentration. Store at 2° to 8° and protect from light. The liquid vaccine should not be allowed to freeze.

USP 31 (Smallpox Vaccine). A suspension or solid containing a suitable strain of the living virus of vaccinia grown in the skin of bovine calves; it may contain a suitable preservative. The liquid vaccine should be stored below 0° and the dried vaccine at 2° to 8°.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Both first and second generation live smallpox vaccines have been associated with a high incidence of adverse effects. The most common adverse effects are injection site reactions, fatigue, fever, headache, malaise, myalgia, erythema, and generalised rash. Rarely there may be generalised vaccinial infection, or severe skin or CNS infection resulting in encephalitis, encephalomyelitis, encephalopathy, necrotising skin infection (progressive vaccinia, vaccinia necrosum), eczema vaccinatum, and erythema multiforme (including Stevens-Johnson syndrome). Fatalities have occurred, particularly from post-vaccination encephalitis and progressive vaccinia. Inadvertent contamination of other body sites (such as the face, mouth, nose, lips, and genitalia) from the site of vaccination also occurs frequently; autoinoculation of the eye (ocular vaccinia) may result in blindness. Benign and malignant lesions have also been reported at the vaccination site.

There have been reports of myocarditis or pericarditis or both, including some fatalities, associated with smallpox vaccination. Smallpox vaccination is not recommended for infants under 12 months of age, for persons with a history of eczema or other skin conditions, those who are immunocompromised, for pregnant women, or for women who breast feed. Household contacts of these groups should also not be vaccinated. Vaccination is best avoided in persons with known cardiac disease.

Uses and Administration

After the global eradication of smallpox in 1980, vaccination against smallpox (using first generation vaccinia virus vaccine) has been indicated for those considered to be at high risk such as laboratory workers handling certain orthopoxviruses, and key emergency, healthcare, and military personnel who may have to respond to a bioterrorist release of smallpox. A second generation smallpox vaccine has been licensed in the USA for inclusion to the National Stockpile for vaccination of those considered to be at high risk for smallpox infection. Persons at high risk and who have received primary vaccination against smallpox, should be re-vaccinated every 10 years. Vaccination is not recommended for persons working with highly attenuated strains of orthopoxviruses.

WHO considers that mass vaccination against smallpox is currently not appropriate, although individuals who may be at risk of exposure to smallpox or those with confirmed infection may be vaccinated.

Recombinant vaccinia viruses are being investigated as vectors of foreign antigens, for example in a candidate AIDS vaccine (p.2203).

Vaccine development. Smallpox[1] is an acute contagious and sometimes fatal disease caused by variola virus, a member of the Poxviridae family and of the orthopoxvirus genus. There is substantial cross-protection between poxviruses of the same genus; the very effective first generation smallpox vaccine used in the global vaccination programme was created from an orthopoxvirus, vaccinia. In 1980 WHO declared smallpox to have been globally eradicated.

There has since been concern that smallpox may be used as a terrorist weapon (although WHO considers this risk to be extremely low in most countries). Therefore, research into safer vaccines against smallpox has continued. First generation vaccine was produced from vaccinia strains grown on the skin of live animals or calf lymph. Despite purification processes, the vaccine contained some bacteria, animal proteins, and adventitious animal viruses, and produced a high incidence of adverse effects, some of which were extremely serious (see Adverse Effects and Precautions, above). Second generation vaccines are single clones of vaccinia isolated from the set of genetically related viruses that made up the first generation ones; they are grown in tissue culture (rather than on animal skin or calf lymph) and are free of bacteria and adventitious animal viruses. A second generation vaccine has been found to be effective and is licensed in the USA for inclusion to the National Stockpile. However, this vaccine still has a high incidence of adverse effects. Third generation vaccines are in the early stages of development. They are being developed from vaccinia strains attenuated by serial passage on non-human tissue or by genetic manipulation, and are expected to be safer than either first or second generation vaccines. Interest has also been shown in monoclonal variola antibodies for passive immunisation.[1,2]

Stocks of smallpox (variola) virus are being kept in a few secure laboratories in the USA and Russia. Since the eradication of smallpox, WHO maintains a stockpile of smallpox vaccine, and recommends vaccination for people with occupational exposure to fully potent orthopoxviruses, such as certain laboratory and healthcare workers. Because of concern that smallpox may be used for bioterrorism, WHO and several countries have increased the number of doses kept in stock.[1] Policies for the use of smallpox vaccine, including bioterrorism preparedness, have been developed in many countries such as the USA[3,4] and UK[5,6] with some countries recommending vaccination for key emergency and military personnel.

Preparations

Ph. Eur.: Smallpox Vaccine (Live);
USP 31: Smallpox Vaccine.

Proprietary Preparations (details are given in Part 3)
USA: ACAM2000; Dryvax.

Snake Venom Antisera

Antisuero contra el veneno de serpiente; Snake Antivenins; Snake Antivenoms.

ATC — J06AA03.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Viper Venom Antiserum, European; Immunoserum Contra Venena Viperarum Europaearum). A preparation containing the specific antitoxic globulins that have the power of neutralising the venom of one or more species of viper (*Vipera ammodytes*, *V. aspis*, *V. berus*, or *V. ursinii*). The globulins are obtained by fractionation of the serum of animals that have been immunised against the venom or venoms. Each mL neutralises the venoms in not less than 100 mouse LD_{50} of *V. ammodytes*, 100 of *V. aspis*, 50 of *V. berus*, or 50 of *V. ursinii*. It should be stored at 2° to 8°, and not be allowed to freeze.

The BP 2008 states that the only poisonous snake native to the British Isles is the adder or common viper, *Vipera berus*. In a geographical region where other species of snake (including elapids) are found, antisera able to neutralise the venoms of the species of snake indigenous to the region should be used. When the preparation is intended to neutralise the venom or venoms of one or more snakes other than vipers, the title Snake Venom Antiserum is used.

USP 31 (Antivenin (Crotalidae) Polyvalent). A sterile freeze-dried preparation of specific venom-neutralising globulins obtained from the serum of healthy horses immunised against 4 species of pit vipers, *Crotalus atrox* (western diamondback), *Crotalus adamanteus*, *Crotalus durissus terrificus* (South American rattlesnake), and *Bothrops atrox* (South American fer de lance). One dose neutralises the venoms in not less than 180 mouse LD_{50} of *C. atrox*, 1320 of *C. durissus terrificus*, and 780 of *B. atrox*. It may contain a suitable preservative. It should be preserved in single-dose containers and stored at a temperature not exceeding 40°.

USP 31 (Antivenin (Micrurus Fulvius)). A sterile freeze-dried preparation of specific venom-neutralising globulins obtained from the serum of healthy horses immunised against venom of *Micrurus fulvius* (eastern coral snake). One dose neutralises the venom in not less than 250 mouse LD_{50} of *M. fulvius*. It may contain a suitable preservative. It should be preserved in single-dose containers and stored at a temperature not exceeding 40°.

Adverse Effects and Precautions

As for antisera in general, p.2201.

Serum sickness is not uncommon and anaphylactic reactions may occur.

Anaphylaxis. Conjunctival or cutaneous hypersensitivity testing failed to predict early (anaphylactic) reactions to the antivenom given in a study of patients in Nigeria with systemic envenoming by the saw-scaled or carpet viper (*Echis carinatus*) and in Thailand with local or systemic envenoming by green pit vipers (*Trimeresurus albolabris* and *T. macrops*), the monocellate Thai cobra (*Naja kaouthia*), or the Malayan pit viper (*Calloselasma rhodostoma*). It was considered that conventional hypersensitivity testing has no predictive value for the occurrence of allergic reactions to antivenom and that it is not justifiable to delay treatment for 20 or 30 minutes to read the results of these tests. Although the rate at which antiserum can be given is more easily controlled by intravenous infusion, this method has serious practical disadvantages in the rural tropics where most cases of snake bite occur and an advantage of the intravenous push injection is that the person giving the antiserum must remain with the patient during the period when most severe anaphylactic reactions develop.

Pretreatment with low-dose subcutaneous adrenaline may reduce the incidence of anaphylaxis and other acute adverse reactions to the antiserum.[1] However, premedication with adrenaline, antihistamines, and corticosteroids, although widely practiced, is controversial. In one study,[2] prophylaxis with promethazine was ineffective in preventing anaphylaxis from antiserum against *Bothrops* envenomation.

2. Fan HW, *et al.* Sequential randomised and double blind trial of promethazine prophylaxis against early anaphylactic reactions to antivenom for bothrops snake bites. *BMJ* 1999; **318:** 1451–2.

Uses and Administration

Venomous snakes comprise the Viperidae (vipers), Elapidae (cobras, kraits, and mambas), and the Hydrophiidae (sea snakes).

The venom of snakes is a complex mixture chiefly of proteins, many of which have enzymatic activity, and may provoke local inflammatory reactions. The venom may have profound effects on tissue, blood vessels and other organs, blood cells, coagulation, and myotoxic or neurotoxic effects with sensory, motor, cardiac, renal, and respiratory involvement.

Snake venom antisera are the only specific treatment available for venomous snake bites, but can produce severe adverse reactions. They are generally only used if there are clear indications of systemic involvement, severe local involvement, or, in regions where supplies are not limited, in patients at high risk of systemic or severe local involvement. Adrenaline should be available in case of anaphylactic reactions to the antiserum; premedication with adrenaline, corticosteroids, and/or antihistamines is widely practiced but is regarded as controversial.

In Great Britain, the only indigenous poisonous snake is the adder, *Vipera berus*; its bite is rarely fatal but European Viper Venom Antiserum (or Zagreb antivenom) may sometimes be indicated as part of the overall treatment. The usual dose for adults and children is 10 mL by intravenous injection over 10 to 15 minutes or by intravenous infusion over 30 minutes after diluting in 5 mL/kg body-weight of sodium chloride 0.9%; the dose may be repeated after about 1 to 2 hours if symptoms of systemic envenoming persist.

In the USA, a polyvalent crotalidae antiserum against *Bothrops atrox*, *Crotalus adamanteus*, *C. atrox*, and *C. durissus terrificus*, and an antiserum against the North American coral snake, *Micrurus fulvius*, are available. In Australia, polyvalent antisera against the brown snake, death adder, taipan, and tiger snake, together with either the king brown snake or black snake, are available. A variety of polyvalent and monovalent antisera are also available as appropriate to the indigenous species of snakes in many other countries.

Snake bites. Most snake species are non-venomous and belong to the colubrid family although a few colubrids are technically venomous. The 3 families of venomous front-fanged snakes are the elapids, vipers, and sea snakes. Elapids include cobras, mambas, kraits, coral snakes, and the Australasian venomous land snakes. Vipers are subdivided into crotalids (pit vipers) and viperids. Viper bites are much more common than elapid bites, except in Australasia, where vipers do not occur naturally. Sea snake bites occur among fishermen of the Asian and western Pacific coastal areas. Although there are some notable exceptions, viper bites tend to cause vasculotoxicity, elapids cause neurotoxicity, and sea snakes cause myotoxicity.

Only a few snakes are known to be of medical importance. Of the vipers these include *Bothrops atrox* (Central and South America), *Bitis arietans* (Africa), *Echis carinatus* (Africa and Asia), *Vipera russelli* (Asia), and *Agkistrodon rhodostoma* (south-east Asia). In a few restricted areas of Africa and Asia, cobra bites are common; bites by mambas (Africa) and kraits (Asia) are rare. The carpet viper, *Echis pyramidum*, and saw-scaled viper, *Echis carinatus*, can justifiably be labelled the most dangerous snakes in the world and they cause more deaths and serious poisoning than any other snake.

Management of snake bite involves general supportive care and monitoring of vital functions but in a systemic snake-bite poisoning, specific snake venom antiserum is the most effective therapeutic agent available. If used correctly, it can reverse systemic poisoning when given hours or even days after the bite. It is highly desirable to wait for clear clinical evidence of systemic poisoning before giving an antiserum and therefore it should not be given routinely in all cases of snake bite. Monospecific antisera are more effective, and less likely to cause reactions, than polyvalent antisera. The dosage of antiserum to be used is dependent on the species of snake and the consequent potency of the requisite antiserum. The antiserum should be given intravenously diluted in isotonic saline, either by infusion or bolus injection (see under Adverse Effects and Precautions, above). First aid measures including incisions and suction to remove the venom and application of tourniquets are generally to be discouraged. In most cases, the bitten limb should be immobilised and the victim transferred to a medical facility, together with the snake if possible. For bites by elapids, when respiratory failure may occur before the patient reaches hospital, a tourniquet may be justified to delay the onset of neurotoxicity. Supportive treatment is necessary even in patients who have received an adequate dose of antiserum. Local pain may be treated with a suitable analgesic. Artificial respiration may be required in patients with symptoms of neurotoxicity. Anticholinesterases may be of benefit against the neurotoxic effects of some snake venoms and it has been recommended that an intravenous test dose of edrophonium preceded by atropine should be tried in patients with severe symptoms of neurotoxicity. For those patients who respond, treatment with neostigmine should be started but anticholinesterases are unlikely to affect outcome in patients who already require assisted respiration. Hypovolaemia should be corrected cautiously with parenteral fluids. Hypotension may be treated with subcutaneous adrenaline or, in patients bitten by Russell's viper, a response to dopamine has been noted. Patients with renal impairment may require dialysis if they do not respond to rehydration, diuretics, and dopamine. Broad spectrum antibacterials and a tetanus vaccine should be given as prophylactic measures. Surgical decompression and debridement of necrotic tissue may be necessary once normal haemostasis has been restored.

Spider Venom Antisera

Antisuero contra el veneno de arañas; Spider Antivenins; Spider Antivenoms.

Pharmacopoeias. Many pharmacopoeias, including *US*, have monographs.

USP 31 (Antivenin (Latrodectus Mactans)). A sterile freeze-dried preparation of specific venom-neutralising globulins obtained from the serum of healthy horses immunised against venom of black widow spiders (*Latrodectus mactans*). One dose neutralises the venom in not less than 6000 mouse LD_{50} of *L. mactans*. It contains thiomersal as preservative. It should be preserved in single-dose containers and stored at a temperature not exceeding 40°.

Adverse Effects and Precautions

As for antisera in general, p.2201.

Uses and Administration

The use of a spider venom antiserum suitable for the species of spider can prevent symptoms, provided that it is done with the least possible delay; other general supportive measures and symptomatic treatment may also be needed.

An antiserum against the black widow spider (*Latrodectus mactans*) is available in the USA and Canada. The contents of a vial containing at least 6000 antivenin units is the usual dose for adults and children. In severe cases and in children under 12 years of age it is given by intravenous infusion in sodium chloride 0.9% over 15 minutes; in less severe cases, it may be given by intramuscular injection.

Antivenoms are also available against other *Latrodectus* species, including the Australian red-back spider (*L. hasselti*) and the South African button spiders. An antiserum against the funnel-web spider (*Atrax robustus*) is available in Australia.

Antivenoms have also been developed against *Loxosceles* spiders and against *Phoneutria* spiders, but there is little evidence of their effectiveness.

Spider bites. Although many species of spider are venomous, relatively few pose a danger to man. Two main clinical syndromes are recognised; necrotic araneism, produced mainly by members of the genus *Loxosceles* which includes the brown recluse spider *L. reclusa*, and neurotoxic araneism produced by members of the genera *Latrodectus* (including the black widow and red-back spiders), *Phoneutria* (South American banana spiders), and *Atrax* (funnel-web spiders).

Necrotic araneism presents as local pain and erythema at the site of the bite, commonly developing into a necrotic lesion with a black eschar that sloughs after a few weeks, sometimes leaving an ulcer that heals gradually. The area affected can be extensive. Rarely, systemic symptoms including intravascular coagulation, haemolytic anaemia, respiratory distress, and renal failure, occur and may be life-threatening. A number of therapies have been suggested, but conservative management is usually adequate with surgical repair of any persistent defects if necessary. Dapsone is reported to produce beneficial effects on healing. Treatment for systemic manifestations is supportive. Antisera are available in some countries.

Neurotoxic araneism may involve severe pain, headache, vomiting, tachycardia, hypertension, muscle spasms, and occasionally pulmonary oedema, and coma, depending upon the species. Antisera are available and reported to be more effective than those for necrotic araneism, but should be reserved for serious envenomation. Intravenous injection of calcium gluconate 10% has been suggested to relieve muscle spasm as an alternative to conventional muscle relaxants.

Staphylococcal Immunoglobulins

Profile

Staphylococcal immunoglobulins are under investigation for passive immunisation against infection with *Staphylococcus aureus*.

Staphylococcal Vaccines

Vacunas estafilocócicas.

Profile

Staphylococcal vaccines have been developed for the prophylaxis of staphylococcal infections.

◊ A vaccine containing *Staphylococcus aureus* type 5 and type 8 capsular polysaccharides conjugated to non-toxic recombinant *Pseudomonas aeruginosa* exotoxin A showed promise[1] in early studies in patients with end-stage renal disease who were receiving haemodialysis; however, later work failed to confirm benefit and its development was stopped.

Stone Fish Venom Antisera

Antisuero contra el veneno del pez piedra estuarino; Stone Fish Antivenins; Stone Fish Antivenoms.

Adverse Effects and Precautions

As for antisera in general, p.2201.

Uses and Administration

An antiserum for use in the management of stings by the stone fish (*Synanceja trachynis*) is available in Australia. The antiserum is prepared from the serum of horses that have been immunised with the venom of the stone fish. Other symptomatic and supportive treatments are given in addition.

Stone fish venom antiserum may be given by intramuscular injection or, in more severe cases, by intravenous infusion. When given by intravenous infusion, it should be diluted 1 in 10 with an intravenous solution. The initial dose of stone fish antivenom given to both adults and children is dependent on the number of visible puncture sites: 1 to 2 puncture sites, 2000 units; 3 to 4 puncture sites, 4000 units; and 5 or more puncture sites, 6000 units. The initial dose may be repeated if necessary should symptoms persist.

Tetanus Antitoxins

Antitoxinas tetánicas.

ATC — J06AA02.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii), have monographs.

Ph. Eur. 6.2 (Tetanus Antitoxin for Human Use; Immunoserum Tetanicum ad Usum Humanum). A sterile preparation containing the specific antitoxic globulins that have the power of neutralising the toxin formed by *Clostridium tetani*. It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against tetanus toxin. For prophylactic use, it has a potency of not less than 1000 international units/mL, and for therapeutic use not less than 3000 international units/mL. It should be stored at 2° to 8°, and not be allowed to freeze.

The BP 2008 states that Tet/Ser may be used on the label.

Profile

Tetanus antitoxins neutralise the toxin produced by *Clostridium tetani* and have been used to provide temporary passive immunity against tetanus, but tetanus immunoglobulins (below) are preferred. A test dose of tetanus antitoxin should always be given to identify those who might suffer hypersensitivity reactions.

Whenever a non-immune patient is seen because of injury, a course of active immunisation should be instituted (see Tetanus Vaccines, p.2240).

Preparations

Ph. Eur.: Tetanus Antitoxin for Human Use.

Tetanus Immunoglobulins

Inmunoglobulinas contra el tétanos.

ATC — J06BB02.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Human Tetanus Immunoglobulin; Immunoglobulinum Humanum Tetanicum). A liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). It is obtained from plasma containing specific antibodies against the toxin of *Clostridium tetani*. Normal immunoglobulin may be added. It contains not less than 100 international units/mL. Both the liquid and freeze-dried preparations should be stored, protected from light, in a colourless, glass container. The freeze-dried preparation should be stored under vacuum or under an inert gas.

USP 31 (Tetanus Immune Globulin). A sterile solution of globulins derived from the plasma of adult human donors who have been immunised with tetanus vaccine. It contains not less than 50 units of tetanus antitoxin/mL. It contains 10 to 18% of protein of which not less than 90% is gamma globulin. It contains glycine as a stabilising agent, and a suitable preservative. It should be stored at 2° to 8°.

Adverse Effects and Precautions

As for immunoglobulins in general, p.2201.

Interactions

As for immunoglobulins in general, p.2201.

Tetanus immunoglobulins will neutralise tetanus toxoid and should not be injected into the same site or in the same syringe as a tetanus vaccine.

Uses and Administration

Tetanus immunoglobulins are used for passive immunisation against tetanus.

The use of tetanus immunoglobulins is recommended in the UK and the USA as part of the management of tetanus-prone wounds in persons unimmunised or incompletely immunised against tetanus, in persons whose immunisation history is unknown, in persons who received the last dose of tetanus vaccine more than 10 years previously, and in patients with impaired immunity. Active immunisation with a tetanus vaccine (p.2240) should also be started simultaneously, and antibacterials and symptomatic therapy given as appropriate (see p.196 and p.1901). The usual dose of tetanus immunoglobulin is 250 units by intramuscular injection but, if more than 24 hours have elapsed since the wound was sustained, or if there is a risk of heavy contamination, or after burns, 500 units should be given irrespective of the immunisation history.

Tetanus immunoglobulin is also used in the treatment of tetanus, a recommended dose being 150 units/kg in total, given intramuscularly into multiple sites.

A preparation suitable for intravenous use is available in some countries. It is given for the treatment of tetanus in a dose of 5000 to 10 000 units by intravenous infusion.

Preparations

Tetanus Vaccines

Vacunas del tétanos.

ATC — J07AM01.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Tetanus Vaccine (Adsorbed); Vaccinum Tetani Adsorbatum). It is prepared from tetanus formol toxoid adsorbed on a mineral carrier which may be hydrated aluminium phosphate or aluminium hydroxide. The resulting mixture is isotonic with blood. Suitable antimicrobial preservatives may be added. The antigenic properties are adversely affected by certain antimicrobial preservatives particularly those of the phenolic type and these should not be added to the vaccine. It contains not less than 40 units per dose. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that Tet may be used on the label.

The BP 2008 directs that when Tetanus Vaccine is prescribed or demanded and the form is not stated, Tetanus Vaccine (Adsorbed) may be dispensed or supplied.

BP 2008 (Tetanus Vaccine). It is prepared from tetanus toxin produced by the growth of *Clostridium tetani*. The toxin is converted to tetanus formol toxoid by treatment with formaldehyde solution. It contains suitable non-phenolic antimicrobial preservatives. It should be stored at 2° to 8° and be protected from light.

The BP 2008 states that Tet/Vac/FT may be used on the label.

The BP 2008 directs that when Tetanus Vaccine is prescribed or demanded and the form is not stated, Tetanus Vaccine (Adsorbed) may be dispensed or supplied.

USP 31 (Tetanus Toxoid). A sterile solution of the formaldehyde-treated products of growth of *Clostridium tetani*. It contains a non-phenolic preservative. It should be stored at 2° to 8° and not be allowed to freeze.

USP 31 (Tetanus Toxoid Adsorbed). A sterile preparation of plain tetanus toxoid precipitated or adsorbed by alum, aluminium hydroxide, or aluminium phosphate adjuvants. It should be stored at 2° to 8° and not be allowed to freeze.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Local reactions, usually after the use of adsorbed vaccines, and mild systemic reactions may occur. The incidence and severity of reactions increases with the number of doses given.

Anaphylaxis and neurological reactions have been reported rarely.

Although vaccination is usually postponed in patients suffering from an acute febrile illness, tetanus vaccine should be given to such patients in the presence of a tetanus-prone wound.

With the exception of the first booster dose of tetanus vaccine (which is usually given before school entry and about 3 years after the primary course), further boosters should not generally be given at intervals of less than 10 years because of an increased risk of severe local reactions.

Effects on the nervous system. Neuropathies have been reported rarely with tetanus vaccination. Optic neuritis and myelitis occurred[1] in an 11-year-old girl after a routine booster dose. Corticosteroids and immunoglobulin were given, and both vision and muscle power were restored after 11 months. Acute transverse myelitis was reported[2] in a 50-year-old man who received a tetanus vaccine and immunoglobulin after an injury. Neurological deficits were unchanged after 1 month despite use of corticosteroids. Other causes could not be ruled out in either case. Brachial neuritis that developed in 2 infants after immunisation with diphtheria, tetanus, and pertussis vaccine was attributed to the tetanus component.[3]

GUILLAIN-BARRÉ SYNDROME. For a discussion on the relationship between tetanus-containing vaccines and Guillain-Barré syndrome, see Diphtheria and Tetanus Vaccines, p.2210.

Pregnancy. No connection has been found between use of tetanus vaccine during pregnancy and either congenital malformations[1] or spontaneous abortion.[2]

1. Silveira CM, *et al.* Safety of tetanus toxoid in pregnant women: a hospital-based case-control study of congenital anomalies. *Bull WHO* 1995; **73:** 605–8.
2. Catindig N, *et al.* Tetanus toxoid and spontaneous abortions: is there epidemiological evidence of an association? *Lancet* 1996; **348:** 1098–9.

Interactions

As for vaccines in general, p.2202.

Tetanus immunoglobulins will neutralise tetanus toxoid and should not be injected into the same site or in the same syringe as a tetanus vaccine.

Uses and Administration

Tetanus vaccines are used for active immunisation against tetanus.

For primary immunisation combined tetanus vaccines, usually diphtheria, tetanus, and pertussis vaccines (p.2210) or diphtheria, tetanus, pertussis, poliomyelitis, and Haemophilus influenzae vaccines (p.2212), are used. For discussion of immunisation schedules, see under Vaccines, p.2202. In adults requiring primary immunisation combined vaccines such as diphtheria and tetanus vaccines (p.2210) or diphtheria, tetanus, and poliomyelitis vaccines (p.2212) are used.

In children who complete the primary course in infancy, reinforcing doses are given at school entry and in adolescence using the recommended appropriate combined vaccines. In adults, a reinforcing dose is desirable 10 years later with a further dose after a further 10 years.

Tetanus vaccines should be part of wound management if primary immunisation is incomplete or boosters are not up-to-date. For tetanus-prone wounds, tetanus immunoglobulin (see above) may also be required. Tetanus vaccine and tetanus immunoglobulin may be given at the same time, but not at the same site. In the event of injury in non-immunised persons or if immunisation status is uncertain, the opportunity is usually taken to initiate a course of primary immunisation. Since this provides no immediate protection, prophylactic treatment with tetanus immunoglobulin is recommended for tetanus-prone wounds. Suitable antibacterial therapy may also be given (see p.196).

Neonatal tetanus. In 1989 WHO adopted a resolution to eliminate neonatal tetanus after estimates revealed that worldwide (but excluding China) it was the cause of 800 000 neonatal deaths each year, a figure representing about 50% of all such deaths in developing countries. Control of neonatal tetanus may be achieved by ensuring adequate hygiene during delivery and by ensuring protective immunity of the mother in late pregnancy. However, by mid-2000 there were 57 countries that had still not eliminated maternal and neonatal tetanus and WHO, UNICEF, and UNFPA agreed to set a target date of 2005 for elimination (defined as a rate of neonatal tetanus below 1 in 1000 live births at district level). However, by the end of 2007, 47 countries were still considered to have not achieved elimination.

Tetanus vaccine is given to all women of child-bearing age as part of WHO's Expanded Programme on Immunization. For pregnant women, 2 doses of vaccine should be given, the second dose at least 4 weeks after the first and at least 2 weeks before delivery; this may provide the newborn infant with about 80% protection against tetanus. For all women of child-bearing age, 3 doses of vaccine, with at least 4 weeks between the first two doses and 6 to 12 months between the second and third doses, provide 95 to 98% protection for at least 5 years. Fourth and fifth doses, each at least one year after the previous dose, prolong the immunity for 10 and 20 years respectively.

Reinforcing doses in adults. Although the current recommendation in the UK is that 5 doses of tetanus vaccine (as a 3-dose primary course in infancy and 2 reinforcing doses at pre-school and in adolescence) is sufficient to produce satisfactory long-term protection in most circumstances, there has been concern about immunity in the elderly, and in particular women. Routine primary immunisation against tetanus was introduced in the UK in 1961, so individuals born before that year would not have been immunised in infancy, and unless they had been in the armed forces, may never have received a full primary course. Unless there is a clear immunisation history immunity to tetanus may be difficult to assess. It is also recommended in the UK that travellers to areas where medical attention may not be accessible, and who had the last dose of vaccine more than 10 years previously, should receive a booster even if they have had 5 doses previously.

Studies in the USA,[1] Australia,[2] and Austria[3] have shown that at least half of healthy people over 50 years of age did not have adequate circulating tetanus antibodies. However, the level of circulating antibodies in the absence of an antigen challenge may not be an appropriate measure of the immune status. The low incidence of clinical tetanus in adults provides circumstantial evidence of an adequate inducible antibody response on exposure to tetanus despite a decline in antibody concentrations with increasing age.[4,5] Conversely, there have been reports of tetanus occurring despite high antibody concentrations.[6,7] There have been calls for the introduction of regular booster injections in adults,[3,7-9] as is standard practice in the USA or alternatively a single booster in late middle age[10,11] or giving a primary course to elderly persons who have never received one.[1]

Tetanus and Influenza Vaccines

Vacunas del tétanos y la gripe.

Profile

Tetanus and influenza vaccines are available in some countries for active immunisation.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Tetagrip.

Tetanus and Poliomyelitis Vaccines

Vacunas del tétanos y la poliomielitis.

Profile

Tetanus and poliomyelitis (inactivated) vaccines have been used in some countries for active immunisation against tetanus and poliomyelitis.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: T. Polio†; Vaccin TP†.

Tick Venom Antisera

Antisuero contra el veneno de garrapata; Tick Antivenins; Tick Antivenoms.

Profile

An antiserum is available in Australia for treatment of the neurotoxic effects of envenomation by the tick *Ixodes holocyclus*. The antiserum is prepared from the serum of dogs that have been immunised with tick venom.

Tick venom antiserum is given by slow intravenous infusion.

Tick-borne Encephalitis Immunoglobulins

Inmunoglobulinas de la encefalitis transmitida por garrapatas.
ATC — J06BB12.

Profile

Preparations containing antibodies against tick-borne encephalitis are available in some countries for passive immunisation against the disease.

Preparations

Proprietary Preparations (details are given in Part 3)
Austria: FSME-Bulin†; ***Cz.:*** FSME-Bulin†; ***Ger.:*** FSME-Bulin†.

Tick-borne Encephalitis Vaccines

Vacunas de la encefalitis transmitida por garrapatas.
ATC — J07BA01.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii), have monographs.

Ph. Eur. 6.2 (Tick-borne Encephalitis Vaccine (Inactivated); Vaccinum Encephalitidis Ixodibus Advectae Inactivatum). A liquid preparation of a suitable strain of tick-borne encephalitis virus grown in cultures of chick-embryo cells or other suitable cell cultures and inactivated by a suitable method. It should be stored at 2° to 8°, not be allowed to freeze, and be protected from light.

The BP 2008 states that Tic/enceph may be used on the label.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Effects on the nervous system. Severe progressive sensorimotor spastic paralysis occurred in a 54-year-old man after a second booster dose of tick-borne encephalitis vaccine.[1] Partial recovery was noted after about 6 months.

1. Bohus M, *et al.* Myelitis after immunisation against tick-borne encephalitis. *Lancet* 1993; **342:** 239–40.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

A vaccine is available in some countries for active immunisation against tick-borne viral encephalitis.

In the UK, vaccination against tick-borne encephalitis is recommended for those who anticipate prolonged exposure to the infective agent, for example persons visiting or working in the warm forested parts of Europe and Scandinavia. The vaccine is given by intramuscular injection in adult doses of 0.5 mL. The primary course consists of three doses, the second being given 4 to 12 weeks after the initial dose, and a third dose 5 to 12 months later. In children over 1 year of age and below 16 years of age, 3 doses of 0.25 mL of the junior formulation of the vaccine are given; the intervals between each dose are the same as for the adult schedule. To achieve rapid short-term protection in adults and children, the second dose may be given 2 weeks after the first dose. Booster doses for adults and children at continued risk should be given within 3 years of the last primary vaccination or booster dose.

Preparations

Ph. Eur.: Tick-borne Encephalitis Vaccine (Inactivated).

Proprietary Preparations (details are given in Part 3)
Austria: Encepur; FSME-Immun; ***Belg.:*** FSME-Immun; ***Canad.:*** FSME-Immun; ***Cz.:*** Encepur; FSME-Immun; ***Denm.:*** TicoVac; ***Fin.:*** Encepur; TicoVac; ***Fr.:*** TicoVac; ***Ger.:*** Encepur; FSME-Immun; ***Hung.:*** Encepur; FSME-Immun; ***Ital.:*** TicoVac; ***Norw.:*** TicoVac; ***Pol.:*** Encepur; FSME-Immun; ***Rus.:*** Encevir (Энцевир); ***Swed.:*** Encepur; FSME-Immun; ***Switz.:*** Encepur; FSME-Immun; ***UK:*** TicoVac.

Trichomoniasis Vaccines

Vacunas de la tricomoniasis.

Profile

A trichomoniasis vaccine containing inactivated *Lactobacillus* spp. is available in some countries for the prophylaxis of recurrent vaginal trichomoniasis. The vaccine is reported to stimulate production of antibodies against the aberrant coccoid forms of the lactobacilli associated with trichomoniasis and also, by cross-reaction, against the trichomonads themselves.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Gynatren.

Tularaemia Vaccines

Vacunas de la tularemia.

Profile

A tularaemia vaccine prepared from a live attenuated strain of *Francisella tularensis* has been used for active immunisation against tularaemia in persons at high risk of contracting the disease.

◊ References.

Typhoid Vaccines

Vacunas de la fiebre tifoidea.
ATC — J07AP01; J07AP02; J07AP03.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii), have monographs.

Ph. Eur. 6.2 (Typhoid Vaccine; Vaccinum Febris Typhoidi). A sterile suspension of inactivated *Salmonella typhi* containing not less than 500 million and not more than 1000 million bacteria per dose which does not exceed 1 mL. It is prepared from a suitable strain of *S. typhi* such as Ty 2. The bacteria are inactivated by heat, or by treatment with acetone, formaldehyde, or phenol, or by phenol and heat. The vaccine should be stored at 2° to 8°, and be protected from light.

The BP 2008 states that Typhoid may be used on the label.

Ph. Eur. 6.2 (Typhoid Vaccine, Freeze-dried; Vaccinum Febris Typhoidi Cryodesiccatum). A freeze-dried preparation of inactivated *Salmonella typhi* containing not less than 500 million and not more than 1000 million bacteria per dose which does not exceed 1 mL. It is prepared from a suitable strain of *S. typhi* such as Ty 2. The bacteria are inactivated by heat, or by treatment with acetone or formaldehyde. Phenol may not be used in the preparation. The vaccine should be stored at 2° to 8°, and be protected from light. It is reconstituted by the addition of suitable sterile liquid and should be used within 8 hours.

The BP 2008 states that Typhoid may be used on the label.

Ph. Eur. 6.2 (Typhoid Vaccine (Live, Oral, Strain Ty 21a); Vaccinum Febris Typhoidis Vivum Perorale (Stirpe Ty 21a)). A freeze-dried preparation of live *S. typhi* strain Ty 21a grown in a suitable medium. It contains not less than 2×10^9 bacteria per dose. It should be stored at 2° to 8°, and be protected from light.

The BP 2008 states that Typhoid(live,oral) may be used on the label.

Ph. Eur. 6.2 (Typhoid Polysaccharide Vaccine; Vaccinum Febris Typhoidis Polysaccharidicum). A preparation of purified Vi capsular polysaccharide obtained from *S. typhi* Ty2 strain or some other suitable strain that has the capacity to produce Vi polysaccharide. It contains 25 micrograms of polysaccharide per dose. It should be stored at 2° to 8° and be protected from light.

The BP 2008 states that Typhoid may be used on the label.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Oral live typhoid and parenteral polysaccharide vaccines have been associated with fewer adverse effects than parenteral killed typhoid vaccines and have replaced them in many countries.

Interactions

As for vaccines in general, p.2202.

Conflicting advice has been issued about the use of live oral typhoid vaccines with antibacterials or antimalarials (particularly mefloquine or proguanil). WHO has stated that all these drugs should be stopped from 3 days before until 3 days after receiving the Ty 21a live oral vaccine. The UK licensed product information advises a separation of 3 days for antibacterials, 12 hours for mefloquine, and 3 days for other antimalarials (but the fixed-dose combination of atovaquone and proguanil may be given with the vaccine). The US product information has indicated that mefloquine (and chloroquine) can be given with the vaccine but that proguanil should only be taken 10 days after the vaccine.

Uses and Administration

Typhoid vaccines are used for active immunisation against typhoid fever. As with many vaccines, the efficacy of typhoid vaccine is not complete and the importance of maintaining attention to hygiene should be emphasised to those travelling to endemic areas.

Typhoid vaccination is advised for laboratory workers handling specimens which may contain typhoid organisms and for persons travelling to areas where typhoid fever is endemic. In the UK, vaccination of contacts of a known typhoid carrier is not recommended; in the USA such persons are advised to receive the vaccine. Typhoid vaccine is not useful in controlling outbreaks of the disease in non-endemic areas.

In the UK, two vaccines are used: a capsular polysaccharide vaccine for parenteral use, and a live oral vaccine.

The capsular polysaccharide typhoid vaccine contains 25 micrograms of the Vi polysaccharide antigen per dose. A single dose of 0.5 mL is given by deep subcutaneous or intramuscular injection. Booster doses may be given every 3 years to those who remain at risk. The response in children under 18 months of age may be suboptimal, and the decision to vaccinate will be governed by the risk of exposure to infection.

The live oral typhoid vaccine contains an attenuated strain of *Salmonella typhi*, Ty 21a, and is given as enteric-coated capsules containing not less than 2×10^9 bacteria per dose. A primary immunisation schedule of one capsule every other day for 3 doses is given.

In the USA, the Vi capsular polysaccharide vaccine and the live oral Ty 21a vaccine are available. The capsular polysaccharide vaccine is given intramuscularly similarly to that in the UK, with a booster dose suggested every 2 years. For the oral vaccine, 4 doses on alternate days are recommended for both primary immunisation and boosters, which are given every 5 years if exposure continues.

In areas where typhoid is endemic WHO advises that immunisation should be considered as part of the routine schedules; either the Vi capsular polysaccharide vaccine or the Ty 21a live oral vaccine should be given to schoolchildren over the age of 2 years. Immunisation of the whole community should also be considered during an outbreak of typhoid; if this is not possible, persons aged 2 to 19 years should be the target group.

Immunisation for travellers. In most developed countries where typhoid is not endemic, the major use for typhoid vaccine is for non-immune travellers visiting endemic areas. The highest incidence of the disease is associated with travel to the Indian subcontinent and parts of tropical South America, although immunisation is also recommended for travellers to lower risk areas of Africa, Asia, and south-east Europe. By far the most important form of protection against gastrointestinal infection is strict attention to personal, food, and water hygiene, although in practice this advice is often difficult to follow.[1]

None of the vaccines used has been 100% effective in preventing disease. The effectiveness of the vaccines has generally been assessed in field trials in the populations of endemic areas. Such populations acquire a degree of natural immunity due to continued exposure and it may not be possible to equate protection rates in these populations to non-immune travellers. The live oral vaccine has been shown to confer a useful degree of immunity in field trials but the dose used may have been insufficient to protect non-immune individuals. The degree of immunity induced may be increased by the use of higher inocula or liquid preparations. In addition, compliance with dosing and storage requirements may further limit the effectiveness of this dosage form.

Large field studies have verified the effectiveness of the capsular polysaccharide vaccine but its efficacy has not been assessed in non-immune populations. However, it does have the advantage of being given as a single dose.

Whole-cell vaccines are generally no longer used because they are frequently associated with adverse effects.

Vaccinia Immunoglobulins

Inmunoglobulinas contra el virus de la vacuna.

ATC — J06BB07.

Pharmacopoeias. Many pharmacopoeias, including *US*, have monographs.

USP 31 (Vaccinia Immune Globulin). A sterile solution of globulins derived from the plasma of adult human donors who have been immunised with vaccinia virus (smallpox vaccine). It contains 15 to 18% of protein, of which not less than 90% is gamma globulin. It contains glycine as a stabilising agent, and a suitable antimicrobial agent. It should be stored at 2° to 8°.

Profile

Vaccinia immunoglobulins have been used intramuscularly for the treatment of clinical complications of smallpox vaccination. They are not effective for postviral encephalitis. A currently available intravenous vaccinia immunoglobulin is given in a usual dose of 100 mg/kg, increased to 200 to 500 mg/kg in the absence of a response.

Preparations

USP 31: Vaccinia Immune Globulin.

Varicella-Zoster Immunoglobulins

Inmunoglobulinas contra el virus de la varicela zóster.

ATC — J06BB03.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Human Varicella Immunoglobulin; Immunoglobulinum Humanum Varicellae). A liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). It is obtained from plasma from selected donors having specific antibodies against *Herpesvirus varicellae*. Normal immunoglobulin may be added. It contains not less than 100 international units/mL. The liquid and freeze-dried preparations should be stored, protected from light, in a colourless, glass container. The freeze-dried preparation should be stored under vacuum or under inert gas.

Ph. Eur. 6.2 (Human Varicella Immunoglobulin for Intravenous Administration; Immunoglobulinum Humanum Varicellae ad Usum Intravenosum). A liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). It is obtained from plasma from selected donors having antibodies against human herpesvirus 3 (varicella-zoster virus 1). Human normal immunoglobulin for intravenous administration may be added. It contains not less than 25 international units/mL. Storage requirements are similar to those for Human Varicella Immunoglobulin, except that the freeze-dried preparation is stored at a temperature not exceeding 25°.

USP 31 (Varicella-Zoster Immune Globulin). A sterile solution of globulins derived from the plasma of adult donors selected for high titres of varicella-zoster antibodies. It contains 15 to 18% of globulins, of which not less than 99% is immunoglobulin G with traces of immunoglobulin A and immunoglobulin M. It contains glycine as a stabilising agent and thiomersal as a preservative. It contains not less than 125 units of specific antibody in not more than 2.5 mL of solution. It should be stored at 2° to 8°.

Adverse Effects and Precautions

As for immunoglobulins in general, p.2201.

Interactions

As for immunoglobulins in general, p.2201.

Uses and Administration

Varicella-zoster immunoglobulins are used for passive immunisation against varicella (chickenpox) in susceptible persons considered to be at high risk of developing varicella-associated complications after exposure to varicella or herpes zoster (shingles).

In the UK, varicella-zoster immunoglobulins are recommended for individuals who are at high risk of severe varicella and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include immunosuppressed patients, neonates including those whose mothers develop chickenpox (but not herpes zoster) in the period 7 days before to 7 days after delivery, and pregnant women. Varicella-zoster immunoglobulin does not prevent infection when given after exposure but may modify the course of disease. Treatment with antivirals may be necessary in severe disease (see p.855).

The doses, given by deep intramuscular injection, of the varicella-zoster immunoglobulin available in the UK are: 250 mg for children up to 5 years of age; 500 mg for those aged 6 to 10 years; 750 mg for those aged 11 to 14 years; and 1 g for all those 15 years of age or older. A further dose is required if a second exposure occurs more than 3 weeks later. Varicella-zoster immunoglobulin should be given as soon as possible and not later than 10 days after exposure. Preparations of normal immunoglobulin for intravenous use may be used to provide an immediate source of antibody.

Varicella-Zoster Vaccines

Vacunas de la varicela zóster.

Ветряночные Вакцины

ATC — J07BK01.

Pharmacopoeias. Many pharmacopoeias have monographs including *Eur.* (see p.vii).

Ph. Eur. 6.2 (Varicella Vaccine (Live); Vaccinum Varicellae Vivum). A freeze-dried preparation of a suitable attenuated strain of *Herpesvirus varicellae* grown in cultures of human diploid cells. The culture medium may contain suitable antibiotics at the smallest effective concentration. It is prepared immediately before use by reconstitution from the dried vaccine; it may contain a stabiliser. The dried vaccine should be stored at 2° to 8°. Protect from light.

The BP 2008 states that Var(Live) may be used on the label.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Varicella vaccines are generally well tolerated. Rashes may occur at the injection site and generalised varicella-like rashes elsewhere have been reported. The vaccine strain of virus can become latent, which could result in late development of zoster infections, but the incidence of herpes zoster is lower after vaccination than in an unvaccinated population. Breakthrough cases of chickenpox have been reported after single- and 2-dose vaccination regimens, but were in most cases milder. The incidence of breakthrough varicella is markedly lower after the 2-dose regimen.

High potency varicella vaccines licensed for active immunisation against herpes zoster (shingles) should not be used for active immunisation against varicella (chickenpox). Persons with active untreated tuberculosis should not be vaccinated.

◊ General references.

1. Black S, *et al.* Postmarketing evaluation of the safety and effectiveness of varicella vaccine. *Pediatr Infect Dis J* 1999; **18:** 1041–6.

Pregnancy. Normally occurring varicella zoster infection may cause fetal harm, therefore as a precautionary measure, vaccination of pregnant women against varicella is generally contra-indicated; advice is also given to avoid pregnancy for 3 months after the last dose of vaccine. However, surveillance of women inadvertently vaccinated during pregnancy has not identified any increased risk, either in terms of congenital varicella or for congenital abnormalities.

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Live attenuated varicella-zoster vaccines may be used for active immunisation against varicella (chickenpox) and herpes zoster (shingles).

In the UK, vaccination against varicella is recommended only for persons considered to be at high risk of contracting the infection or highly susceptible to any complications it might cause; such patients include susceptible healthcare workers, and healthy contacts of immunocompromised patients when continuing close contact is unavoidable. A single dose of 0.5 mL is given subcutaneously to children aged 12 months to 13 years. Those aged 13 years and older should receive two doses at an interval of 4 to 8 weeks.

In the USA, a 2-dose vaccination regimen is recommended as part of the primary immunisation schedule of infants and children (see under Vaccines, p.2202). The first dose of 0.5 mL is given subcutaneously to children aged 12 to 15 months and the second dose at 4 to 6 years of age. Routine vaccination is also recommended for persons over the age of 13 years without evidence of immunity; two doses are given at an interval of 4 to 8 weeks. Those who only received 1 dose should receive a second, catch-up dose.

In the USA, a high potency vaccine (containing a minimum of 19 400 plaque-forming units) against herpes zoster is recommended for persons 60 years of age and older. A single dose of 0.65 mL is given subcutaneously.

A combination vaccine of measles, mumps, rubella, and varicella (MMRV) is available in the USA for use in children aged 12 months to 12 years.

◊ Results of studies of varicella-zoster vaccines for active immunisation against chickenpox in healthy and leukaemic children have been largely favourable. Protective **efficacy** in healthy children appears to be over 90%. In healthy adolescents and adults, adding a second dose 4 or 8 weeks after the first increased seroconversion rates from about 70 to 80% to 97% or better.[1] A protective efficacy of about 85% has been reported in leukaemic children given one dose of varicella-zoster vaccine[2,3] and interruption of chemotherapy for vaccination does not appear necessary in terms of immunogenicity of the vaccine.[2,4]

The **duration of immunity** after a 1-dose regimen for active immunisation against chickenpox is also under debate; despite at least 70 to 90% effectiveness, some consider that a single dose does not provide sufficient herd immunity levels to prevent outbreaks, especially in school settings.[5,6] Initial studies show that the immunity induced by natural infection with wild type virus is superior to that induced by the vaccine. In one study,[3] antibodies were absent in about one-quarter of all vaccinees (both leukaemic children and healthy adults) 1 year after a second dose of vaccine, but were still present after up to 6 years in all those who had breakthrough varicella infection.

However, immunity to varicella-zoster is complex, depending not only on circulating antibody but also on cellular immunity and secretory antibody. Thus, although a person may become seronegative after vaccination, protection from varicella may remain, albeit partial.[2] Both humoral and cell mediated immunity have been shown to persist for up to 20 years after vaccination.[7] Leukaemic children observed up to 6 years after immunisation have continued to be well protected[2] and varicella in previously-vaccinated persons is usually mild.[5,6]

Surveillance data collected from 11 356 children in the USA between 1995 and 2004 found that annual rates of breakthrough varicella increased significantly with time. Children aged 8 to 12 years at the onset of disease who had been vaccinated 5 years or more previously were 2.6 times more likely to have moderate or severe breakthrough varicella than those vaccinated less than 5 years previously.[8] The efficacy of a 2-dose vaccination regimen (doses given 3 months apart) was assessed in 2216 children over a period of 9 to 10 years.[9] Children vaccinated with the 2-dose regimen were 3.3 times less likely to develop varicella more than 42 days after vaccination than those who had received a single dose. During the 10-year follow-up period most breakthrough cases occurred in years 2 to 5, for both treatment regimens. No breakthrough cases were reported in years 7 to 10 for those who received the 2-dose regimen, while 10 cases were reported for those who received the 1-dose regimen. Since June 2007 the US Advisory Committee on Immunization Practices (ACIP) has recommended that children between the ages of 4 and 6 years receive a second dose of varicella vaccine.[6]

Varicella-zoster vaccine may prevent or modify varicella if given within 3 days of exposure to the infection. It may be useful as an **adjunct** to varicella-zoster immunoglobulin. The treatment of varicella-zoster infections with antivirals is discussed on p.855.

One concern of varicella-zoster vaccination has been the possibility of an **increased risk of herpes zoster** (shingles) in immunised children. Although herpes zoster has been reported in vaccinated persons, a study involving 346 leukaemic children and 84 matched controls concluded that the incidence of herpes zoster following varicella-zoster vaccine was no greater than that following natural varicella infection.[10] The study did suggest that the risk of herpes zoster may be lowered by vaccination but this must be confirmed by long-term follow-up. Postmarketing surveys[11] of almost 90 000 vaccine recipients also showed a low incidence of herpes zoster. The vaccine strain of varicella-zoster virus is transmissible, particularly from vaccinees who develop a rash (see also Pregnancy under Adverse Effects, above). There is no evidence of reversion to virulence of the vaccine strain with secondary transmission.

Another concern is that vaccination of children could result in more severe infections in later life after immunity has waned. However, studies have shown that in general varicella is less severe in previously immunised than in non-immunised patients.[12,13]

The risk of zoster increases with age reflecting the waning of the specific cell-mediated immunity to the virus. Thus, the use of a high-potency varicella-zoster vaccine has been investigated in elderly subjects. In a randomised, double-blind, placebo-controlled study in over 38 000 subjects aged 60 or more the vaccine reduced the burden of illness due to herpes zoster by 61.1% and the incidence of herpes zoster and of postherpetic neuralgia by 51.3% and 66.5% respectively.[14] In the USA, high-potency varicella-zoster vaccine is recommended by the ACIP for all people 60 years of age and older, including those who have already had an episode of shingles.[15]

Yellow Fever Vaccines

Vacunas de la fiebre amarilla.

ATC — J07BL01.

Pharmacopoeias. Many pharmacopoeias, including *Eur.* (see p.vii) and *US*, have monographs.

Ph. Eur. 6.2 (Yellow Fever Vaccine (Live); Vaccinum Febris Flavae Vivum). A freeze-dried preparation of the 17D strain of yellow fever virus grown in fertilised hen eggs. It is reconstituted immediately before use. It should be stored at 2° to 8° and be protected from light.

The BP 2008 states that Yel(live) may be used on the label.

USP 31 (Yellow Fever Vaccine). A freeze-dried preparation of a selected attenuated strain of live yellow fever virus cultured in chick embryos. It is reconstituted, just prior to use, by the addition of sodium chloride containing no antimicrobial agent. It should be stored under nitrogen preferably below 0° but not above 5°.

Adverse Effects and Precautions

As for vaccines in general, p.2201.

Local and general reactions are not common after vaccination for yellow fever. Very rarely encephalitis has occurred, generally in infants under 9 months of age. Therefore, yellow fever vaccine is not usually given to infants under 9 months (but see Vaccine-associated Neurotropic Disease, below).

There is as yet limited data on the safety of yellow fever vaccine in HIV-positive individuals. In the UK, it is recommended that specialist advice should be sought regarding the use of yellow fever vaccine in such individuals. WHO advises that the vaccine should be given to HIV-positive individuals who are asymptomatic if the risk of infection is high.

Pregnancy. Although yellow fever vaccine has been given to women during pregnancy without producing adverse effects in the infants,[1] fetal infection has been reported.[2] US recommendations[3] therefore advise that the safety of yellow fever vaccination during pregnancy has not been established and the vaccine should only be given to pregnant women if travel to an endemic area is unavoidable and if an increased risk of exposure exists. Infants born to these women should be monitored closely for evidence of congenital infection or other adverse effects.

2. Tsai TF, *et al.* Congenital yellow fever virus infection after immunization in pregnancy. *J Infect Dis* 1993; **168:** 1520–3.
3. CDC. Yellow fever vaccine: recommendations of the Advisory Committee on Immunization Practices (ACIP), 2002. *MMWR* 2002; **51** (RR-17): 1–11. Also available at: http://www.cdc.gov/mmwr/PDF/rr/rr5117.pdf (accessed 25/05/06)

Vaccine-associated neurotropic disease. Yellow fever vaccine has been associated with rare reports of encephalitis, now termed vaccine-associated neurotropic disease (YEL-AND). WHO has stated[1] that, since 1945, there have been at least 26 cases of proven or probable YEL-AND of which 16 occurred in infants aged less than 6 months. Of the 26 cases, 24 recovered without further complications and there were 2 fatalities.[1] Vaccine virus recovered from one of the fatalities, a 3-year-old child, revealed that mutation had occurred in the envelope gene of the virus, but it is not known whether similar mutations occurred in the other cases. The other fatality occurred in an immunocompromised adult with HIV infection. As a precaution against possible encephalitis, infants less than 9 months of age are not generally immunised, although it may be advisable to immunise at 6 to 8 months of age during epidemics.

1. WHO. Yellow fever vaccine: WHO position paper. *Wkly Epidem Rec* 2003; **78:** 349–59.

Vaccine-associated viscerotropic disease. Yellow fever vaccine has been associated with rare reports of multiple organ failure, now termed yellow fever vaccine-associated viscerotropic disease (YEL-AVD). WHO has stated[1] that, between 1996 and 2001, there were 7 recorded cases of YEL-AVD of which 2 occurred in Brazil,[2] 4 in the USA,[3] and one in Australia.[4] Six of these 7 cases were fatal. A further case, also leading to fatality, was reported to have occurred in Spain in 2004.[5] It has been suggested that the most likely explanation is an idiosyncratic host susceptibility to the 17D vaccine strain rather than a reversion of the vaccine strain to a wild-type strain.[5] There is also some evidence to suggest that the risk of YEL-AVD is greater in patients aged over 60 years.[6]

Interactions

As for vaccines in general, p.2202.

Uses and Administration

Yellow fever vaccines are used for active immunisation against yellow fever. Immunity is usually established within about 10 days of administration and persists for many years. Only one dose is required for immunisation and is given by deep subcutaneous injection; the dose (0.5 mL) is the volume containing at least 1000 mouse LD_{50} units.

In the UK, immunisation against yellow fever is recommended for laboratory workers handling infected material, for persons travelling through or living in areas of infection, and for travellers entering countries which require an International Certificate of Vaccination. The immunity produced may last for life although officially an International Certificate of Vaccination against yellow fever is valid only for 10 years starting 10 days after the primary immunisation and only if the vaccine used has been approved by WHO and given at a designated centre.

Vaccination under 9 months of age is not generally recommended (see Adverse Effects and Precautions, above).

Immunisation schedules. The 17D (Rockefeller) yellow fever vaccine is now the only yellow fever vaccine produced.[1,2] The quantity available in the world has been limited and its relatively short half-life does not permit the accumulation of large stocks. The demand for the vaccine is also somewhat irregular, being suddenly high during epidemics and low during inter-epidemic periods.

In Africa and in South America two different strategies for yellow fever immunisation have been followed.[1,2] Firstly, an emergency immunisation programme takes place once an outbreak has begun, in an attempt to limit the spread of infection by immunising all persons in the focus, regardless of their former immune status. One disadvantage is that immunity does not appear until 7 days after immunisation and deaths may be expected to occur in the interim period. Secondly, a routine mass immunisation programme for yellow fever is aimed at immunising in advance all populations considered to be at risk. Yellow fever vaccine is included in the WHO Expanded Programme on Immunization; there are obvious logistic advantages in giving it at the age of 9 months at the same time as measles vaccine. In rural areas of the endemic zone that are considered at high risk, the minimum age for routine immunisation may be lowered to 6 months (see Vaccine-associated Neurotropic Disease, above).

Supplementary Drugs and Other Substances

This chapter includes some drugs not easily classified, herbal medicines, new drugs whose place in therapy is not yet clear, and drugs no longer used clinically but still of interest. There are also monographs on toxic substances, the effects of which may require drug therapy.

Abrus

Abrus Seed; Indian Liquorice; Jequirity Bean; Jumble Beads; Prayer Beads; Regaliz americano; Rosary Beans.

Profile

Abrus consists of the seeds of *Abrus precatorius* (Leguminosae), one of whose constituents is abrin. Abrin, which is closely related to ricin, is considered responsible for the toxic effects of the seeds. Children have died from eating one or more seeds. Toxicity may be less likely to occur if the seeds are swallowed whole, than if they are chewed, because of the hard seed coat. Toxic effects may occur within a few hours or may be delayed for several days after ingestion. Signs and symptoms of abrin poisoning are similar to those described for ricin, p.2379.

Abrus has been used as an oral contraceptive in herbal medicine.

Homoeopathy. Abrus has been used in homoeopathic medicines.

◊ References.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Indon.:*** Enkasari; Ika Sariawan.

Absinthium

Absinthe; Absinthii herba; Ajenjo; Assenzio; Fehér ürömfű; Karčiųjų kiečių žolė; Losna; Mali, Koiruoho; Malört; Pelin; Pelyňková nať; Wermutkraut; Wormwood; Ziele piołunu.

CAS — 546-80-5 (α-thujone); 471-15-8 (β-thujone).

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of absinthium:
Green Fairy; Green Goddess; La Fée Verte.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Wormwood). The leaves or flowering tops, or a mixture of these dried, whole or cut organs of wormwood, *Artemisia absinthium*. It contains not less than 2 mL/kg of essential oil, calculated with reference to the dried drug. Protect from light.

Profile

Absinthium has been used as a bitter. It is also used in small quantities as a flavour in alcoholic beverages, although it is considered in some countries to be unsafe for use in foods, beverages, or drugs. Habitual use or large doses cause absinthism, which is characterised by restlessness, vomiting, vertigo, tremors, and convulsions. Thujone, related to camphor, is the major constituent of the essential oil derived from absinthium.

Homoeopathy. Absinthium has been used in homoeopathic medicines under the following names: Artemisia absinthium; Artemisia absinthium ex herba siccata; Absinth.

Multi-ingredient: ***Austria:*** Abdomilon N; Eryval; Magentee St Severin; Mariazeller; Sigman-Haustropfen; Virgilocard; ***Braz.:*** Camomila; ***Cz.:*** Abdomilon†; Contraspan†; Eugastrin†; Original Schwedenbitter; Zaludecni Cajova Smes; ***Fr.:*** Tisane Hepatique de Hoerdt; ***Ger.:*** Abdomilon N; Amara-Pascoe; Amara-Tropfen; Anore X N†; Aristochol N†; Floradix Multipretten N; Gallemolan forte; Gallemolan G†; Gallexier; Gastralon N†; Gastritol; Gastrol S†; Hepaticum novo†; Leber-Galle-Tropfen 83†; Lomatol†; Majocarmin forte†; Majocarmin mite†; Marianon†; Nervosana†; Neurochol C†; Pascopankreat; Presselin Blahungs K 4 N†; Presselin Dyspeptikum†; rohasal†; Stomachysat N†; Stovalid N†; Stullmaton†; Unex Amarum†; ventriloges N; ***India:*** Toniazol†; ***Ital.:*** Assenzio (Specie Composta)†; Genziana (Specie Composta)†; ***Pol.:*** Artemisol; Krople Zoladkowe; ***Rus.:*** Maraslavin (Мараславин); Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера); ***S.Afr.:*** Amara; ***Switz.:*** Baume†; Kernosan Heidelberger Poudre; Phytomed Hepato†; Pommade au Baume.

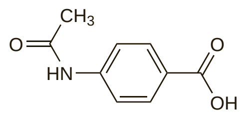
Acedoben *(pINN)*

Acedobén; Acédobène; Acedobenum. *p*-Acetamidobenzoic acid.

Ацедобен

$C_9H_9NO_3$ = 179.2.

CAS — 556-08-1.



Profile

Acedoben is a component of inosine pranobex (p.884), and has been given orally as the potassium salt in the treatment of skin disorders. Acedoben and its sodium salt have been applied topically.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Spain:*** Amplidermis; Hongosan.

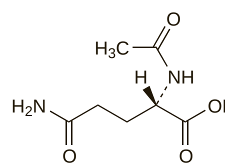
Aceglutamide *(rINN)*

Aceglutamida; Acéglutamide; Aceglutamidum. N^2-Acetyl-L-glutamine; 2-Acetylamino-L-glutaramic acid.

Ацеглутамид

$C_7H_{12}N_2O_4$ = 188.2.

CAS — 2490-97-3.



Profile

Aceglutamide has been given in an attempt to improve memory and concentration. Aceglutamide aluminium (p.1704) is used as an antacid.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ital.:*** Acutil Fosforo; Memovisus†; Tonoplus†.

Acemannan *(USAN, rINN)*

Acemanán; Acémannan; Acemannanum; Polymanoacetate.

Ацеманнан

CAS — 110042-95-0.

Profile

Acemannan is a highly acetylated, polydispersed, linear mannan obtained from the mucilage of *Aloe vera* (*A. barbadensis*). It has immunomodulating properties and is an ingredient of topical wound dressing products including those formulated for the oral mucosa.

Preparations

Proprietary Preparations (details are given in Part 3)

USA: Carrasyn; DiaB Gel; Oral Wound Rinse; RadiaGel; SaliCept; Ultrex.

Acetic Acid

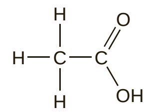
Acide acétique; Ácido acético; Ácido etanóico; Acidum aceticum; Acto rūgštis; Asetik Asit; Ättiksyra; E260; Ecetsav; Eisessig (glacial acetic acid); Essigsäure; Etanoico; Ethanoic Acid; Etikkahappo; Kwas octowy; Kyselina octová.

$C_2H_4O_2$ = 60.05.

CAS — 64-19-7.

ATC — G01AD02; S02AA10.

ATC Vet — QG01AD02; QS02AA10.



NOTE. The nomenclature of acetic acid often leads to confusion over whether concentrations are expressed as percentages of glacial acetic acid ($C_2H_4O_2$) or of a diluted form. In *Martindale*, the percentage figures given against acetic acid represent the amount of $C_2H_4O_2$.

Pharmacopoeias. Glacial acetic acid is included in *Chin., Eur.* (see p.vii), *Int., Jpn*, and *US.*

Solutions containing about 30 to 37% are included in *Br.* (33%), *Chin.* (36 to 37%), *Int., Jpn* (30 to 32%), and *Swiss* (30%). Also in *USNF* (36 to 37%).

Dilute acetic acid (6%) is included in *Br.* and *Int.* Also in *USNF.*

Ph. Eur. 6.2 (Acetic Acid, Glacial; Acidum Aceticum Glaciale). A crystalline mass or a clear colourless volatile liquid. F.p. not lower than 14.8°. Miscible with water, with alcohol, and with dichloromethane. Store in airtight containers.

BP 2008 (Acetic Acid (33 per cent)). It contains 32.5 to 33.5% w/w of $C_2H_4O_2$. It is a clear colourless liquid with a pungent odour. Miscible with water, with alcohol, and with glycerol.

BP 2008 (Acetic Acid (6 per cent)). It contains 5.7 to 6.3% w/w of $C_2H_4O_2$. It is prepared by diluting Acetic Acid (33 per cent).

USP 31 (Glacial Acetic Acid). A clear colourless liquid with a pungent characteristic odour. B.p. about 118°. Miscible with water, with alcohol, and with glycerol. Store in airtight containers.

USNF 26 (Acetic Acid). It contains 36 to 37% w/v of $C_2H_4O_2$. It is a clear colourless liquid with a strong characteristic odour. Miscible with water, with alcohol, and with glycerol. Store in airtight containers.

USNF 26 (Diluted Acetic Acid). It contains 5.7 to 6.3% w/v of $C_2H_4O_2$. It is prepared by diluting Acetic Acid. Store in airtight containers.

Adverse Effects and Treatment

Local or topical application of acetic acid preparations may produce stinging or burning. Ingestion of glacial acetic acid can produce similar adverse effects to those of hydrochloric acid (p.2322), which may be treated similarly.

Uses and Administration

Glacial acetic acid has been used as an escharotic. Diluted forms have been used as an antibacterial (it is reported to be effective against *Haemophilus* and *Pseudomonas* spp.), antifungal, and antiprotozoal in vaginal gels and douches, irrigations, topical preparations for the skin and nails, and in ear drops. Diluted forms have also been used as an expectorant, an astringent lotion, and as treatments for warts (p.1584), callosities, and for certain jellyfish stings (see below). Solutions have also been used to soften ear wax (p.1725) and in the treatment of otitis externa (p.182). Visual inspection of the uterine cervix with acetic acid (VIA) is being investigated as a screening method for cervical cancer, particularly where facilities for cytological methods may be limited.

A solution containing 4% w/v $C_2H_4O_2$ is known as artificial vinegar or non-brewed condiment. Vinegar is a product of fermentation.

Jellyfish sting. Vinegar or acetic acid 3 to 10% is applied to box jellyfish stings to inactivate any fragments of adherent tentacle[1,2] (see p.2220). Acetic acid solutions have been reported to be useful in stings by related species[3] although they may produce further discharge of venom in some jellyfish.[4]

Acetohydroxamic Acid *(USAN, rINN)*

N-Acetyl Hydroxyacetamide; Acide Acétohydroxamique; Ácido acetohidroxámico; Acidum Acetohydroxamicum; AHA.

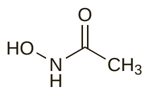
Ацетогидроксамовая Кислота

$C_2H_5NO_2$ = 75.07.

CAS — 546-88-3.

ATC — G04BX03.

ATC Vet — QG04BX03.



Pharmacopoeias. In *US*.

USP 31 (Acetohydroxamic Acid). White, slightly hygroscopic, crystalline powder. Freely soluble in water and in alcohol; very slightly soluble in chloroform. Store in airtight containers at a temperature between 8° and 15°.

Adverse Effects and Precautions

Phlebitis, thromboembolism, haemolytic anaemia, and iron-deficiency anaemia have occurred. Bone-marrow depression has been reported in *animal* studies. Other adverse effects include headache, gastrointestinal disturbances, alopecia, rash (particularly after ingestion of alcohol), trembling, and mental symptoms including anxiety and depression. Blood counts and renal function should be monitored regularly during treatment. Patients with acute renal failure should not be given acetohydroxamic acid.

Pregnancy. Studies in *animals* indicate that acetohydroxamic acid is teratogenic.

Interactions

Acetohydroxamic acid chelates iron given orally, resulting in reduced absorption of both. Ingestion with alcohol may precipitate skin rash.

Pharmacokinetics

Acetohydroxamic acid is rapidly absorbed from the gastrointestinal tract with peak serum concentrations being reached within 1 hour. The plasma half-life is reported to be up to 10 hours, but may be longer in patients with impaired renal function. Acetohydroxamic acid is partially metabolised to acetamide, which is inactive; up to about two-thirds of a dose may be excreted unchanged in the urine.

Uses and Administration

Acetohydroxamic acid acts by inhibiting bacterial urease, thus decreasing urinary ammonia concentration and alkalinity. It is used in the prophylaxis of struvite renal calculi (p.2181) and as an adjunct in the treatment of chronic urinary-tract infections (p.199).

Acetohydroxamic acid is given orally in a usual dose of 250 mg three or four times daily. The total dose should not exceed 1.5 g daily. Children have been given 10 mg/kg daily in 2 or 3 divided doses. Dosage should be adjusted in patients with renal impairment (see below).

Administration in renal impairment. Acetohydroxamic acid should not be given to patients with serum-creatinine concentrations in excess of about 220 micromoles/litre. If the concentration is between 160 and 220 micromoles/litre, the maximum daily dose should be 1 g and the dosing interval should be extended to every 12 hours.

Preparations

USP 31: Acetohydroxamic Acid Tablets.

Proprietary Preparations (details are given in Part 3)
Spain: Uronefrex; ***USA:*** Lithostat.

Acetylleucine *(rINN)*

Acetileucina; Acétylleucine; Acetylleucinum; RP-7542. *N*-Acetyl-DL-leucine.

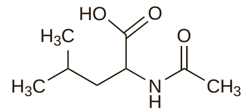
Ацетиллейцин

$C_8H_{15}NO_3$ = 173.2.

CAS — 99-15-0.

ATC — N07CA04.

ATC Vet — QN07CA04.



Profile

Acetylleucine has been used in the treatment of vertigo (p.565) in usual oral doses of up to 2 g daily, in divided doses, or 1 g daily by intravenous injection. Higher doses have occasionally been used.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Tanganil.

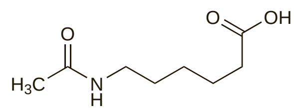
Acexamic Acid *(BAN, rINN)*

Acide Acexamique; Ácido acexámico; Acidum Acexamicum; CY-153; Epsilon Acetamidocaproic Acid. 6-Acetamidohexanoic acid.

Ацексамовая Кислота

$C_8H_{15}NO_3$ = 173.2.

CAS — 57-08-9 (acexamic acid); 70020-71-2 (zinc acexamate).



Pharmacopoeias. *Eur.* (see p.vii) includes Zinc Acexamate.

Profile

Acexamic acid is related structurally to the antifibrinolytic agent aminocaproic acid (p.1053). Acexamic acid, usually as the calcium or sodium salt, has been used topically or systemically to promote the healing of ulcers and various other skin lesions. Zinc acexamate has been given for peptic ulcer disease.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: Plastenan; Restaurene; ***Belg.:*** Plastenan; ***Fr.:*** Plastenan†; ***Mex.:*** Recoveron; ***Port.:*** Plastesol†; ***Spain:*** Copinal.

Multi-ingredient: ***Arg.:*** Bagoderm; Cicatrizol; Lisoderma; Plastenan con Neomicina; ***Fr.:*** Trofoseptine†; ***Mex.:*** Dermatolona; Recoveron N; Recoveron NC; ***Port.:*** Plastenan Neomicina†; ***Spain:*** Plaskine Neomicina; Unitul Complex†.

Achillea

Achillée millefeuille; Aquilea; Cickafarkfű; Kraujažolių žolė; Milfoil; Millefolii herba; Řebříčková nat'; Rölleka; Schafgarbe; Siankärsämö; Yarrow; Ziele krwawnika.

CAS — 8022-07-9 (yarrow root oil).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Yarrow). The whole or cut, dried flowering tops of yarrow, *Achillea millefolium*. It contains not less than 2 mL/kg of essential oil and not less than 0.02% of proazulenes, expressed as chamazulene ($C_{14}H_{16}$ = 184.3), both calculated with reference to the dried drug. Protect from light.

Profile

Achillea has been used in herbal medicine. It has been stated to have diaphoretic, anti-inflammatory, and other miscellaneous properties. It has been reported to cause contact dermatitis.

Yarrow root oil is used in aromatherapy.

Homoeopathy. Achillea has been used in homoeopathic medicines under the following names: Achillea millefolium; Millefolium; Achillea ex herba; Millef.

Acid Alpha Glucosidase

Acid Maltase; α-Glucosidasa; Lysosomal α-glucosidase.

Alglucosidase Alfa *(USAN, rINN)*

Alglucosidasa alfa; Alglucosidasum Alfa; rhGAA.

Альглюкозидаза Альфа

CAS — 420784-05-0.

ATC — A16AB07.

ATC Vet — QA16AB07.

Profile

Alglucosidase alfa is a recombinant form of human acid alpha glucosidase given as enzyme replacement therapy for the treatment of the lysosomal storage disease Pompe disease (glycogen storage disease type II). This is a rare fatal autosomal recessive disorder caused by a deficiency of acid α-glucosidase, which cleaves α-1,4- and α-1,6-glucosidic linkages in lysosomal glycogen to liberate glucose. Glycogen accumulation results in progressive myopathy, especially of the skeletal muscles and heart.

Alglucosidase alfa is given intravenously using an infusion pump in doses of 20 mg/kg once every 2 weeks. The total volume of fluid, which is determined by the patient's body-weight, should be infused over about 4 hours. The infusion rate should be increased gradually: the initial rate should not exceed 1 mg/kg per hour; once the patient can tolerate this rate, it may be increased every 30 minutes by 2 mg/kg per hour with monitoring of vital signs before each increase; the maximum infusion rate is 7 mg/kg per hour.

Infusion reactions are common with alglucosidase alfa; symptoms may resolve on decreasing the infusion rate, temporarily stopping the infusion, and/or use of antihistamines and/or antipyretics, which may also be given as pre-treatment. Severe reactions may require stopping the infusion immediately. Serious hypersensitivity reactions, including anaphylactic shock, have also been reported during infusion of alglucosidase alfa.

Acid Fuchsine

Acid Magenta; Acid Roseine; Acid Rubine; CI Acid Violet 19; Colour Index No. 42685; Fucsina ácida.

Profile

Acid fuchsine is the disodium or diammonium salt of the trisulfonic acid of magenta. It is used as a microscopic stain and a pH indicator.

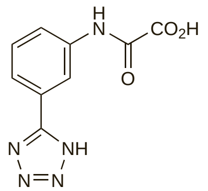
Acitazanolast (rINN)

Acitazanolastum; WP-871. 3′-(1*H*-tetrazol-5-yl)oxanilic acid.

Ацитазанопаст

$C_9H_7N_5O_3$ = 233.2.

CAS — 114607-46-4.



Profile

Acitazanolast is a leukotriene inhibitor used as the hydrate in a concentration of 0.1 or 0.3% in eye drops for the treatment of allergic conjunctivitis (p.564).

Preparations

Proprietary Preparations (details are given in Part 3)
Jpn: Zepelin.

Aconite

Acetylbenzoylaconine (aconitine); Aconit.; Aconit napel; Aconite Root; Aconiti Tuber; Acónito; Aconitum napellus; Monkshood Root; Radix Aconiti; Wolfsbane Root. 8-Acetoxy-3,11,18-trihydroxy-16-ethyl-1,6,19-trimethoxy-4-methoxymethylaconitan-10-yl benzoate (aconitine).

$C_{34}H_{47}NO_{11}$ = 645.7 (aconitine).

CAS — 8063-12-5 (aconite); 302-27-2 (aconitine).

NOTE. Wolfsbane is also used as a common name for arnica flower (p.2260).

Description. Aconite consists of the dried tuberous root of *Aconitum napellus* agg. (Ranunculaceae). It contains a number of alkaloids, the main pharmacologically active one being aconitine.

Pharmacopoeias. In *Chin.*

Adverse Effects and Treatment

Aconite has variable effects on the heart leading to heart failure. It also affects the CNS.

Symptoms of aconite poisoning may appear within minutes or up to 2 hours after oral ingestion; in fatal poisoning death usually occurs within 12 hours, although with larger doses it may be instantaneous.

Initial symptoms (and an important diagnostic feature) are tingling sensations of the tongue, mouth, fingers, and toes followed by generalised paraesthesia. Other symptoms include nausea, vomiting, diarrhoea, muscle weakness, skeletal muscle paralysis, and difficult respiration; also sweats, chills and a feeling of intense cold may occur. Respiratory paralysis, hypotension, and cardiac arrhythmias may develop in severe cases.

Although the benefits of gastric decontamination are uncertain, gastric lavage may be tried in patients within one hour of life-threatening oral poisoning; activated charcoal may also be considered. Patients should be observed and monitored, and corrective and supportive treatment given as necessary. Arrhythmias are relatively resistant to treatment, although atropine has been tried for bradycardia.

Poisoning. Reports of poisoning with aconite.

1. Kelly SP. Aconite poisoning. *Med J Aust* 1990; **153:** 499.

4. Mak W, Lau CP. A woman with tetraparesis and missed beats. *Hosp Med* 2000; **61:** 438.
5. Imazio M, *et al.* Malignant ventricular arrhythmias due to Aconitum napellus seeds. *Circulation* 2000; **102:** 2907–8.
6. Chan TYK. Incidence of herb-induced aconitine poisoning in Hong Kong: impact of publicity measures to promote awareness among the herbalists and the public. *Drug Safety* 2002; **25:** 823–8.
7. Lowe L, *et al.* Herbal aconite tea and refractory ventricular tachycardia. *N Engl J Med* 2005; **353:**1532.

Uses and Administration

Aconite liniments have been used in the treatment of neuralgia, sciatica, and rheumatism. Sufficient aconitine may be absorbed through the skin to cause poisoning; liniments should never be applied to wounds or abraded surfaces. Aconite should not be used internally because of its low therapeutic index and variable potency; however it is reported to be a common ingredient in traditional Chinese remedies and is also an ingredient of some cough mixtures.

Homoeopathy. Aconite has been used in homoeopathic medicines.

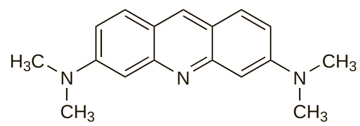
Acridine Orange

Naranja de acridina. 3,6-Bis(dimethylamino)acridine.

$C_{17}H_{19}N_3$ = 265.4.

CAS — 494-38-2.



Profile

Acridine orange is a dye with antiseptic properties. It has been used as a diagnostic stain in microbiology.

For details of the antiseptic properties of acridine derivatives, see p.1624.

Diagnostic use. Acridine orange has been used for the diagnostic staining of malarial parasites.[1] For the quantitative buffy coat method, acridine orange is used to stain the parasites in a blood sample that is then centrifuged, and the area just below the buffy coat is examined under a fluorescence microscope. It has been described as easier and quicker to use than the standard examination of stained blood films. However, this method is not specific for diagnosis of malarial type, gives only a rough indication of infection intensity, and can give false-positive results. Acridine orange has also been tried for the staining of blood slides.[2-5]

Acrolein

Acraldehyde; Acrialdehído; Acroleína; Acrylaldehyde; Acrylic Aldehyde. Prop-2-enal.

C_3H_4O = 56.06.

CAS — 107-02-8.

Profile

Acrolein is a volatile, highly flammable liquid at ordinary temperature and pressure. It has various industrial uses, but is also a toxic byproduct of combustion and may be present in exhaust gases, tobacco smoke, and smoke from fires. It is irritant to the skin and may cause skin burns. Ingestion of acrolein produces severe gastrointestinal distress. The vapour causes lachrymation and pulmonary irritation. Inhalation may cause pulmonary oedema and permanent lung damage.

Acrolein is a metabolite of cyclophosphamide (p.702) and may be responsible for the latter's bladder toxicity.

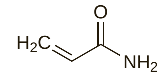
Acrylamide

Acrilamida; Akryloamid; Amida acrílica. Propenamide.

C_3H_5NO = 71.08.

CAS — 79-06-1.



Profile

Acrylamide is highly toxic and irritant; it can be absorbed through unbroken skin. Symptoms of poisoning include burning and ulceration of the mouth and throat following ingestion. Excessive sweating is common and other symptoms may include numbness of limbs, paraesthesias, and muscle weakness. CNS effects such as somnolence, confusion, hallucinations, ataxia, tremors, dysarthria, and nystagmus may occur depending on the severity of exposure. Peripheral neuropathies may appear several weeks after severe acute exposure or as a result of chronic exposure. Gastric lavage may be tried in patients within one hour of ingestion; activated charcoal may also be considered. Contamination of eyes and skin should be irrigated and treated as for burns. Patients should be observed and monitored, and corrective and supportive treatment given as necessary.

Acrylamide has various industrial applications, including use as a plasticiser and a waterproof 'chemical grout'.

Food toxicity. Concerns have been expressed by the Swedish National Food Administration about the level of acrylamide they found in certain cooked foods, particularly those exposed to very high temperatures such as fried foods, and the potential carcinogenic risk. However, it has been acknowledged that, although the results have been replicated in other international laboratories, the total sample size is small and none of the methods being used have so far been validated.[1] One subsequent population-based study failed to find any excess risk or convincing trend of cancer of the bowel, bladder, or kidney in high consumers of foods with a high or moderate acrylamide content.[2] The joint FAO/WHO Expert Committee on Food Additives (JECFA)[3] reviewed data provided by 24 countries on acrylamide in food analysed between 2002 and 2004. Their recommendations were for re-evaluation of the effects of acrylamide on completion of studies of carcinogenicity and neurotoxicity, and that efforts to reduce the concentrations of acrylamide in food should continue.

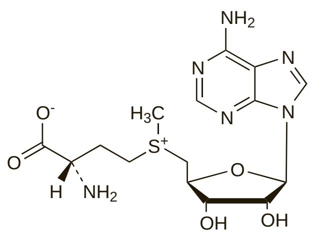
Ademetionine *(rINN)*

Ademethionine; Ademetioniini; Adémétionin; Ademetionin; Ademetionina; Ademetioninum; *S*-Adenosyl-L-methionine; Methioninyl adenylate; SAMe. (*S*)-5′-[(3-Amino-3-carboxypropyl)methylsulphonio]-5′-deoxyadenosine hydroxide, inner salt.

Адеметионин

$C_{15}H_{22}N_6O_5S$ = 398.4.
CAS — 29908-03-0; 485-80-3; 17176-17-9.
ATC — A16AA02.
ATC Vet — QA16AA02.



Profile

Ademetionine is a naturally occurring molecule found in virtually all body tissues and fluids. It acts as a methyl group donor in many transmethylation reactions and therefore is involved in the synthesis or metabolism of a wide range of compounds that maintain normal cell function. Ademetionine sulfate tosilate and ademetionine butanedisulfonate are stable forms of ademetionine that have been used for the treatment of depression (see below), liver disorders, and osteoarthritis.

5. Gören JL, *et al.* Bioavailability and lack of toxicity of S-adenosyl-L-methionine (SAMe) in humans. *Pharmacotherapy* 2004; **24:** 1501–7.

Depression. Ademetionine has been given orally or parenterally in the management of depression (p.373). It appears to be of similar efficacy to the tricyclic antidepressants but evidence is limited to small, heterogeneous groups of patients studied over short periods of time; additionally many studies have involved parenteral rather than oral therapy.

Liver disorders. Some workers have found that ademetionine produced clinical improvement in patients with **intrahepatic cholestasis**,[1,2] including that associated with pregnancy.[3,4] Pruritus associated with the condition has also been relieved. Other studies,[5,6] however, have not found any benefit.

Ademetionine produced a good or excellent clinical response in patients with **hepatic steatosis**.[7] In a study[8] of patients with **alcoholic liver cirrhosis**, treated with ademetionine for 2 years, there was a trend towards reduced overall mortality or need for liver transplantation, but only in patients with less severe hepatic dysfunction. However, a systematic review[9] of 9 randomised placebo-controlled studies, which included the latter study could not find evidence to support or refute the claim that ademetionine has a beneficial effect in patients with alcoholic liver diseases, and larger high quality randomised placebo-controlled studies are needed.

9. Rambaldi A, Gluud C. S-Adenosyl-L-methionine for alcoholic liver diseases. Available in The Cochrane Database of Systematic Reviews; Issue 2. Chichester: John Wiley; 2006 (accessed 01/04/08).

Osteoarthritis. Ademetionine has been reported to possess therapeutic efficacy in the treatment of osteoarthritis (p.11) and similar conditions, possibly due to an effect on cartilage metabolism and formation of anti-inflammatory mediators within the cell; it may also inhibit leukotrienes but does not appear markedly to interfere with prostaglandin synthesis.

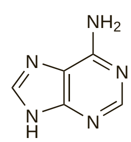
Adenine

Adeniini; Adenin; Adenina; Adeninas; Adénine; Adeninum; Vitamin B_4; Vitamina B_4. 6-Aminopurine; 1,6-Dihydro-6-iminopurine.

Аденин

$C_5H_5N_5$ = 135.1.
CAS — 73-24-5.



Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Adenine). A white or almost white powder. Very slightly soluble in water and in alcohol; dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

USP 31 (Adenine). Odourless white crystals or crystalline powder. Very slightly soluble in water; sparingly soluble in boiling water; slightly soluble in alcohol; practically insoluble in chloroform and in ether.

Profile

Adenine is a purine base and one of the components of adenosine nucleotides that form nucleic acids (p.2355). It is also a constituent of many coenzymes. It has been used to extend the storage life of whole blood (p.1056) and has also been given for the management of white blood cell disorders and alcoholism. Adenine hydrochloride has been used similarly.

Preparations

USP 31: Anticoagulant Citrate Phosphate Dextrose Adenine Solution.

Proprietary Preparations (details are given in Part 3)
Fr.: Leuco-4.

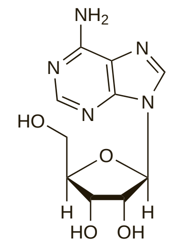
Multi-ingredient: ***Fr.:*** TTD-B -B ; ***Philipp.:*** Godex; ***Rus.:*** Lidevine (Лидевин); ***Spain:*** Hepadif.

Adenosine Phosphate *(BAN, USAN, rINN)*

Adenosine Monophosphate; Adenosine 5′-Monophosphate; Adénosine, Phosphate d'; Adenosine-5′-(dihydrogen phosphate); Adenosine-5′-phosphoric Acid; Adenosini Phosphas; 5′-Adenylic Acid; AMP; A-5MP; Fosfato de adenosina; Monophosadénine; Muscle Adenylic Acid; NSC-20264. 6-Amino-9-β-D-ribofuranosylpurine 5′-(dihydrogen phosphate).

Аденозина Фосфат

$C_{10}H_{14}N_5O_7P$ = 347.2.
CAS — 61-19-8.
ATC — C01EB10.
ATC Vet — QC01EB10.



(adenosine)

Pharmacopoeias. *Ger.* includes the disodium salt ($C_{10}H_{12}N_5Na_2O_7P,xH_2O$).

Profile

Adenosine phosphate is an endogenous adenine nucleotide involved in many biological processes. Adenosine monophosphate (AMP) is a vasodilator and has been included in preparations for venous insufficiency, haemorrhoids, and varicose veins. It has also been used in pain and inflammation. Adenosine diphosphate and its disodium salt have also been used. AMP is also used in bronchial challenge tests to assess airway hyper-responsiveness in asthma and other respiratory disorders.

Unlike adenosine (p.1202) or adenosine triphosphate (below), adenosine phosphate is not used in supraventricular tachycardias.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Adenyl.

Multi-ingredient: ***Cz.:*** Laevadosin†; ***S.Afr.:*** Lipostabil†; ***Spain:*** Artri; Taurobetina†.

Adenosine Triphosphate

Adenosina, trifosfato de; Adenosine 5′-Triphosphate; 5′-Adenyldiphosphoric Acid; Adenylpyrophosphoric Acid; ATP; Trifosadenina; Triphosadénine. Adenosine 5′-(tetrahydrogen triphosphate).

Аденозинтрифосфат

$C_{10}H_{16}N_5O_{13}P_3$ = 507.2.
CAS — 56-65-5.
ATC — C01EB10.
ATC Vet — QC01EB10.

Pharmacopoeias. *Ger.* includes the disodium salt ($C_{10}H_{14}N_5Na_2O_{13}P_3$ = 551.1).

Profile

Adenosine triphosphate (ATP) is an endogenous adenine nucleotide with a fundamental role in cellular energy transformation; ATP is hydrolysed to adenosine diphosphate (ADP) releasing energy stored in phosphate bonds. In addition, extracellular ATP influences many biological processes.

ATP is a vasodilator that has been used in varied disorders. The sodium and disodium salts have been used in cerebral and peripheral vascular disorders and also for the treatment of supraventricular tachycardias, although adenosine (p.1202) is the form generally used as an antiarrhythmic. ATP has also been investigated for use in cachexia in patients with cancer.

CAS — 62-13-5.

ATC — A01AD06; B02BC05.

ATC Vet — QA01AD06; QB02BC05.

Profile

Adrenalone hydrochloride is used as a local haemostatic and vasoconstrictor. It has also been used with adrenaline in eye drops for glaucoma.

Preparations

Proprietary Preparations (details are given in Part 3)

Denm.: Stryphnon†; ***Ger.:*** Stryphnasal†.

Multi-ingredient: *Ger.:* Links-Glaukosan†.

Aesculus

Aesculus hippocastanum; Castaño de indias; Hippocastani semen; Horse-chestnut; Marron d'Inde; Rosskastaniensamen.

CAS — 6805-41-0 (aescin); 11072-93-8 (β-aescin); 531-75-9 (anhydrous esculoside).

Pharmacopoeias. In *Fr., Ger., It.,* and *US.*

US also includes the powdered form and powdered extract.

Ger. also includes esculoside in the sesquihydrate form.

USP 31 (Horse Chestnut). The dried seeds of *Aesculus hippocastanum* (Hippocastanaceae), harvested in the autumn. It contains not less than 3.0% of triterpene glycosides, calculated on the dried basis as aescin. Protect from light and moisture.

Profile

The seeds (conkers) and other parts of the horse-chestnut, *Aesculus hippocastanum*, contain several active principles including esculoside (aesculin or esculin; 6-β-D-glucopyranosyloxy-7-hydroxycoumarin, $C_{15}H_{16}O_9$ = 340.3) and aescin (escin), which is a mixture of saponins.

Ingestion of aesculus may cause nausea, vomiting, diarrhoea, abdominal colic, delirium, and with large doses respiratory arrest.

Aescin and esculoside, the major active principles of aesculus, have been used in the prevention and treatment of various peripheral vascular disorders, including haemorrhoids (p.1697). They have been given by mouth, by intravenous injection (in the form of sodium aescinate), by rectal suppository, and applied topically. Aescin has also been given intravenously in the prevention and treatment of postoperative oedema. The maximum intravenous dose in adults for such conditions has been stated to be 20 mg daily; acute renal failure has been reported in patients given higher doses, sometimes with other nephrotoxic drugs.

Other derivatives such as sodium aescin polysulfate have also been used.

Homoeopathy. Aesculus has been used in homoeopathic medicines under the following names: Aesculus hippocastanum; Aesculus cortex; Aesculus hippocastanum ex cortice; Aesc. hip.

Esculoside has been used in homoeopathic medicines under the following names: Aesculinum; Aescul.

Adverse effects. EFFECTS ON THE KIDNEYS. A report of the incidence of acute renal failure in patients after cardiac surgery and implicating high-dose intravenous aescin therapy.[1] In 70 patients given a mean maximum daily dose of 340 micrograms/kg, no alteration of renal function was seen; in 16 receiving 360 micrograms/kg, mild renal impairment occurred; and in 40 given 510 micrograms/kg, acute renal failure developed.

1. Hellberg K, *et al.* Medikamentös bedingtes post-operatives Nierenversagen nach herzchirurgischen Eingriffen. *Thoraxchirurgie* 1975; **23:** 396–400.

EFFECTS ON THE RESPIRATORY TRACT. Bronchial asthma associated with aescin inhalation has been reported in a worker in the pharmaceutical industry.[1]

1. Muñoz X, *et al.* Occupational asthma related to aescin inhalation. *Ann Allergy Asthma Immunol* 2006; **96:** 494–6.

EFFECTS ON THE SKIN. Contact dermatitis[1] to aesculin and contact urticaria[2] to aescin have been reported after the use of topical preparations that contained these extracts. Both reactions were confirmed by positive skin tests.

1. Comaish JS, Kersey PJ. Contact dermatitis to extract of horse chestnut (esculin). *Contact Dermatitis* 1980; **6:** 150–1.
2. Escribano MM, *et al.* Contact urticaria due to aescin. *Contact Dermatitis* 1997; **37:** 233.

POISONING. There have been reports of poisoning in children from eating the seeds, or drinking infusions made from the leaves and twigs of horse-chestnut trees.[1] The toxic substance is considered to be esculoside. Symptoms of poisoning were muscle twitching, weakness, lack of coordination, dilated pupils, vomiting, diarrhoea, paralysis, and stupor.

1. Nagy M. Human poisoning from horse chestnuts. *JAMA* 1973; **226:** 213.

Uses. The use of aesculus has been reviewed;[1,2] although there is some evidence suggesting benefit in chronic venous insufficiency, more rigorous studies are needed.[2]

Afelimomab *(rINN)*

Afélimomab; Afelimomabum; MAK-195F. Immunoglobulin G3, anti-(human tumor necrosis factor α) F(ab′)2 fragment (mouse monoclonal LU54107 γ3-chain), disulfide with mouse monoclonal LU54107 κ-chain, dimer.

Афелимомаб

CAS — 156227-98-4.

ATC — L04AB03.

ATC Vet — QL04AB03.

Profile

Afelimomab is a monoclonal tumour necrosis factor antibody that has been investigated for the treatment of sepsis.

Aflatoxins

Aflatoxinas.

CAS — 1162-65-8 (aflatoxin B_1); 7220-81-7 (aflatoxin B_2); 1165-39-5 (aflatoxin G_1); 7241-98-7 (aflatoxin G_2); 6795-23-9 (aflatoxin M_1); 6885-57-0 (aflatoxin M_2).

Profile

Aflatoxins are toxic metabolites produced by many strains of *Aspergillus flavus* and *A. parasiticus*, growing on many vegetable foods, notably maize and peanuts. A number of forms, including aflatoxins B_1, B_2, G_1, and G_2 have been identified. Aflatoxins M_1 and M_2 are metabolites produced by animals after ingestion of aflatoxins B_1 and B_2; they may be detected in cows' milk.

Aflatoxins can cause hepatitis and cirrhosis. They have been implicated in liver cancer, and may act as co-carcinogens with hepatitis B virus. Aflatoxin B_1 is reported to be one of the most potent carcinogens known in *animals*. It has been reported that aflatoxins have been developed in some countries as biological weapons.

Agnus Castus

Agni Casti; Agni casti fructus; Agnocasto; Chaste Tree Fruit; Chasteberry; Drmkový plod; Gattilier, fruit de; Keuschlamm; Mönchspfeffer; Monk's Pepper; Munkpeppar; Owoc niepokalanka zwyczajnego; Sauzgatillo; Siveydenpuunhedelmä; Zerolo.

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Agnus Castus Fruit). The whole, ripe, dried fruit of *Vitex agnus castus*. It contains a minimum 0.08% of casticin calculated with reference to the dried drug. Protect from light.

USP 31 (Chaste Tree). The dried ripe fruits of *Vitex agnus-castus* (Verbenaceae). It contains not less than 0.05% of agnuside and not less than 0.08% of casticin, calculated on the dried basis.

Profile

Agnus castus is reported to affect the secretion of luteinising hormone, follicle stimulating hormone, and prolactin by the pituitary. Both inhibition and stimulation of prolactin secretion have been reported, and may be dose-dependent. Agnus castus is included in herbal preparations for the symptoms of premenstrual syndrome, including mastalgia; it has also been used for menstrual cycle irregularities or menopausal disorders, but should be avoided in patients receiving exogenous sex hormones, including oral contraceptives.

Homoeopathy. Agnus castus has been used in homoeopathic medicines under the following names: Vitex agnus-castus; Agn. cast.

◊ References.

4. Chrubasik S, Roufogalis BD. Chaste tree fruit for female disorders. *Aust J Pharm* 2001; **82:** 156–7.

Adverse effects, precautions, and interactions. The adverse effects of agnus castus are reported to be mild and reversible, with acne, erythematous rash, headache, gastrointestinal disorders, menstrual disorders, nausea, and pruritus being the most frequently reported. Toxicity data for use of agnus castus during pregnancy and breast feeding are sparse, but in view of its pharmacological actions, use is not recommended. There is a theoretical possibility of drug interactions between agnus castus and dopamine antagonists.[1]

Agrimony

Agrimonia; Agrimoniae herba; Aigremoine; Dirvuolių žolė; Maarianverijuuri; Odermennigkraut; Párlófű; Řepíková nať; Småborre.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Agrimony). The dried flowering tops of *Agrimonia eupatoria* containing a minimum of 2.0% of tannins expressed as pyrogallol, calculated with reference to the dried drug.

Profile

Agrimony, the aerial parts of *Agrimonia eupatoria* (Rosaceae) or more rarely *A. procera* (*A. odorata*; fragrant agrimony), has astringent and diuretic properties. It is used internally for diarrhoea, biliary and other gastrointestinal disorders, and urinary-tract disorders; it has also been used for inflammatory mouth and throat disorders. It has been used externally for wound healing and skin disorders.

Homoeopathy. Agrimony has been used in homoeopathic medicines.

Preparations

Alfalfa

Lucerne; Purple medick.

Profile

Alfalfa is the plant *Medicago sativa* (Leguminosae) which is cultivated as an animal feedstuff. The seeds and sprouts of alfalfa contain canavanine (2-amino-4-(guanidinooxy)butyric acid), a toxic amino acid structurally related to arginine; content is reported to represent about 1.5% of the dry weight. A syndrome resembling SLE has been recorded in *monkeys* fed alfalfa.

Alfalfa is used in herbal preparations for a variety of disorders.

Homoeopathy. Alfalfa has been used in homoeopathic medicines under the following names: Alfa.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: *Austral.:* Irontona; Neo-Cleanse; Panax Complex†; Plantiodine Plus†; Vitatona; ***Chile:*** Calcio 520; Fucus Compuesto†; ***Fr.:*** Gonaxine; Gynosoja; Menoxine.

Alfaprostol *(BAN, USAN, rINN)*

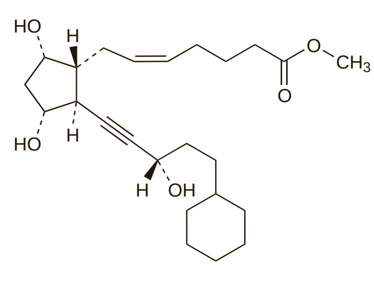
Alfaprostolum; K-11941; Ro-22-9000. Methyl (*Z*)-7-{(1*R*,2*S*,3*R*,5*S*)-2-[(3*S*)-5-cyclohexyl-3-hydroxypent-1-ynyl]-3,5-dihydroxycyclopentyl}hept-5-enoate.

Альфапростол

$C_{24}H_{38}O_5$ = 406.6.

CAS — 74176-31-1.

ATC Vet — QG02AD94.



Profile

Alfaprostol is a synthetic analogue of dinoprost (prostaglandin $F_{2\alpha}$). It is used as a luteolytic in veterinary medicine.

Alglucerase *(BAN, USAN, rINN)*

Alglucerasa; Alglucérase; Alglucerasum; Glucosylceramidase; Macrophage-targeted β-Glucocerebrosidase.

Альглюцераза

CAS — 143003-46-7.

ATC — A16AB01.

ATC Vet — QA16AB01.

Description. Alglucerase is a modified form of human placental β-glucocerebrosidase (ceramide glucosidase; β-D-glucosyl-*N*-acylsphingosine glucohydrolase). It is a monomeric glycoprotein of 497 amino acids with glycosylation making up about 6% of the molecule.

Imiglucerase *(BAN, USAN, rINN)*

Imiglucerasa; Imiglucérase; Imiglucerasum; Imiglukeraasi; Imiglukeras; Imigluseraz; Recombinant Macrophage-targeted β-Glucocerebrosidase; r-GCR.

Имиглюцераза

CAS — 154248-97-2.

ATC — A16AB02.

ATC Vet — QA16AB02.

Description. Imiglucerase is a recombinant human-derived β-glucocerebrosidase. It is a monomeric glycoprotein of 497 amino acids, containing 4 N-linked glycosylation sites

Adverse Effects and Precautions

Fever, chills, pruritus, flushing, and gastrointestinal symptoms, including cramps, diarrhoea, nausea, and vomiting have been reported after use of alglucerase or imiglucerase. Some of these may be hypersensitivity reactions; other hypersensitivity reactions, including urticaria and angioedema, respiratory symptoms, and hypotension have also occurred. Anaphylactoid reactions have occurred rarely with imiglucerase. Caution is required in patients who have exhibited signs of hypersensitivity; reduction of the rate of infusion, and pretreatment with antihistamines and/or corticosteroids may permit further treatment. Antibodies have developed in about 15% of patients receiving a glucocerebrosidase enzyme during the first year of therapy. Patients who develop antibodies are at increased risk of hypersensitivity reactions and periodic assessment for antibody formation is recommended.

Pain and irritation at the injection site may occur. Other adverse effects reported include fatigue, dizziness, headache, backache, peripheral oedema, mouth ulcers, and disturbances in sense of smell.

Alglucerase is prepared from human placentas and its infusion therefore carries a risk of transmission of infections although this is minimised by the manufacturing process. Chorionic gonadotrophin, a naturally occurring hormone in human placentas, has been detected in alglucerase. The presence of this hormone may produce early virilisation in young boys if sufficient is given, and has the potential to produce false positive results in pregnancy tests that rely on the detection of this hormone. Alglucerase should be used with caution, if at all, in patients with androgen-sensitive malignancies.

Pharmacokinetics

After intravenous infusion, plasma enzymatic activities of alglucerase and imiglucerase decline rapidly from steady state, with an elimination half-life of between 3.6 and 10.4 minutes.

Uses and Administration

The enzyme β-glucocerebrosidase is given as imiglucerase (or occasionally alglucerase) for long-term enzyme replacement therapy to patients with symptomatic Gaucher disease (see below). The oligosaccharide chains of the enzyme are modified to terminate with mannose residues to ensure uptake into macrophages.

Imiglucerase is given by intravenous infusion over 1 to 2 hours for the treatment of type 1 or type 3 Gaucher disease. Alternatively, the dose may be infused at a rate not exceeding 1 unit/kg per minute. The dosage depends on the severity of symptoms, and initial doses can vary from 2.5 units/kg three times weekly to 60 units/kg once every two weeks. Further increases or decreases in doses are made according to individual response. Once the patient's condition is stabilised, monitoring and dosage adjustment up or down is carried out at usual intervals of 6 to 12 months. In the UK, the *BNFC* notes that higher doses of 120 units/kg infused over 1 to 2 hours are given once every 2 weeks for type 3 Gaucher disease.

Alglucerase has been given by intravenous infusion in similar doses with monitoring and dosage adjustment at intervals of 3 to 6 months in stabilised patients with type 1 Gaucher disease.

Gaucher disease. Gaucher disease[1-4] (glucocerebrosidosis) is a rare, autosomal recessive disorder, although it is the commonest lysosomal storage disorder. It is caused by a deficiency of the lysosomal enzyme β-glucocerebrosidase (acid β-glucosidase, ceramide glucosidase, β-D-glucosyl-*N*-acylsphingosine glucohydrolase, or glucosylceramidase) which catalyses the hydrolysis of glucocerebroside, a lipid component of cell membranes, to glucose and ceramide. Deficiency of β-glucocerebrosidase results in accumulation of glucocerebroside in the lysosomes of reticuloendothelial cells, particularly macrophages.

Gaucher disease is **classified** into three main forms based on clinical signs and symptoms. Hepatosplenomegaly occurs in all forms. **Type 1 Gaucher disease** (chronic adult non-neuronopathic disease) accounts for 90% or more of cases and occurs especially in Ashkenazi Jews. More than half of all patients with type 1 disease are diagnosed before the age of 10 years.[5] The disease follows a chronic course of variable severity and onset, with hepatosplenomegaly and blood and bone disorders being the main features; there is no neurological involvement. In **type 2 Gaucher disease** (acute infantile neuronopathic disease), neurological involvement predominates. Patients show developmental delay by the age of 6 months, suffer seizures, pulmonary infections, and usually die in early childhood. **Type 3 Gaucher disease** is a subacute neuronopathic form and is slowly progressive.[4] There are 3 subtypes varying in severity and prognosis: in type 3a, there is slow progressive neurological deterioration with death usually occurring during childhood; in type 3b (Norrbotten disease) there is slow cognitive deterioration and patients may survive to adulthood; type 3c typically affects patients of Palestinian, Arab, or Japanese descent, with possible survival to the teenage years.

Treatment of Gaucher disease was previously limited to symptomatic management until the development of enzyme replacement therapy with β-glucocerebrosidase. Due to the rarity of Gaucher disease, early clinical studies were limited mainly to small case series of patients with type 1 disease. Use of alglucerase or imiglucerase has been shown to reverse hepatosplenomegaly and the haematological abnormalities;[6,7] effects may be seen within a few months, although in many the response is poor during the first 6 to 9 months and then improves rapidly.[2] Return to normal haemoglobin values within 6 to 12 months has been reported, as has reduction in liver size by 20 to 30% within 2 years and 30 to 40% by 5 years; a 50% reduction in spleen size also occurred.[8] Bone symptoms respond more slowly. Decreases in bone pain during the first year of treatment have been reported although there was no radiological improvement.[7] Existing bone manifestations are slow to respond or refractory to enzyme replacement therapy, but alendronate has been shown to be of benefit as adjunctive therapy for osteopenia in 36 adults with negative lumbar bone mineral density scores who had been receiving glucocerebrosidase for at least 2 years.[9] Normalised growth velocity has been reported in children[10] and radiographical assessments have shown improvements in bone density and mineralisation.[11] There is evidence that long-term enzyme replacement therapy for up to 5 years completely or partially ameliorates anaemia, thrombocytopenia, organomegaly, and bone pain in patients with type 1 Gaucher disease, as well as preventing further deterioration.[8] However, successful symptom control is dependent on the degree of damage that has already occurred, and early initiation of therapy is recommended for a more favourable prognosis. Enzyme replacement therapy in Gaucher disease is lifelong and relapses occur with prolonged interruptions to therapy.[5,12] Alglucerase has also been tried in rare cases of Gaucher disease affecting the heart[13] or the eye.[14] It is not yet known whether enzyme replacement therapy is able to prevent the development of symptoms in asymptomatic patients.

The efficacy of enzyme replacement therapy in managing neurological symptoms in patients with type 2 or type 3 disease[15] remains to be established. Most of the patients with type 3 Gaucher disease in a small study[16] did not deteriorate neurologically when treated with doses that reversed almost all the systemic manifestations. However, it was pointed out that the amount of enzyme that crosses the blood-brain barrier is unlikely to be significant, and other forms of treatment specifically for neuronopathic Gaucher disease need to be developed.

For those patients with type 1 Gaucher disease in whom enzyme replacement therapy may be unsuitable, miglustat may be used. It reduces the synthesis of glucocerebroside by inhibiting glucosyltransferase, one of the early enzymes in the sphingolipid biosynthetic pathway. However, the balance of benefits versus adverse affects with miglustat is less favourable than with imiglucerase, which remains the standard treatment where possible; the two drugs should not be used together.[17]

Possible future therapies under investigation for Gaucher disease include oral therapy with the pharmacological chaperone isofagomine, and gene therapy. Other modified forms of β-glucocerebrosidase are also under investigation to improve uptake into the affected macrophages.

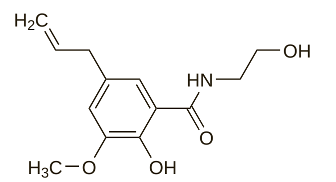
Alibendol *(rINN)*

Alibendolum. 5-Allyl-*N*-(2-hydroxyethyl)-3-methoxysalicylamide.
Алибендол
$C_{13}H_{17}NO_4 = 251.3.$
CAS — 26750-81-2.



Profile

Alibendol is a choleretic used in the treatment of gastrointestinal disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Cebera†.

Allergen Products

Alergenos; Allergeenivalmisteet; Allergenprodukter; Producta allergenica; Produits allergènes.

Adverse Effects and Treatment

Adverse effects to allergen products can range from mild local reactions to severe generalised reactions that may be fatal, especially reactions to bee and wasp venom. Hypersensitivity reactions may be immediate or delayed.

Adverse effects with **skin-prick testing** are uncommon, although swelling and irritation at the injection site, rhinitis, urticaria, wheezing, and chest tightness might occur, and rarely, anaphylactic shock.

Allergen immunotherapy injections may give rise to swelling, irritation, redness, and hardness at the injection site. Systemic reactions include itching eyes, sneezing, cough, wheezing, chest tightness, atopic eczema, urticaria, and oedema. Anaphylactic shock or severe delayed reactions may also occur. Commonly reported adverse effects with allergen preparations given sublingually include oral oedema, pruritus, and paraesthesia, throat irritation, sneezing, rhinitis, nasal congestion, itching of the eyes and ears, and headache; systemic reactions may occur if the dosage regimen is not adhered to.

Severe reactions to allergen products normally occur within 30 minutes and should be treated promptly with intramuscular adrenaline injection 1 in 1000. Full supportive measures should be implemented and treatment with antihistamines and corticosteroids may be required (for a discussion of the treatment of anaphylaxis and anaphylactic shock, see p.1205). Further allergen immunotherapy should be stopped or continued at reduced dosage depending on the severity of the reaction and in accordance with the licensed product information.

◊ In 1986 the UK CSM reported[1] that hyposensitising vaccines have the potential to induce severe bronchospasm and anaphylaxis, and that these reactions had caused 26 deaths in the UK since 1957. The majority of patients had no reaction to previous hyposensitising injections. In 1989 the FDA reported that since 1980, the American Academy of Allergy and Immunology and the FDA had received 14 reports of death after allergen immunotherapy, and 4 deaths after skin testing for allergies.[2] The most common clinical factor in these patients was a history of asthma.

In view of these and other reports, recommendations have been made to minimise the risks of systemic reactions.[3-6] Allergen immunotherapy should only be used for seasonal allergic rhinoconjunctivitis not responding to anti-allergic drugs, and for severe hypersensitivity to Hymenoptera stings. In the UK[4] such treatment has usually been avoided in patients with asthma (although asthma is not an absolute contra-indication to Hymenoptera allergen immunotherapy), but elsewhere[3,5,6] asthmatic patients whose asthma is stable and not severe may be treated. Hyposensitising agents should be used only where facilities for full cardiopulmonary resuscitation are immediately available. The recommended length of time after injection that patients should be kept under medical observation varies from 30 minutes[3] to 1 hour.[4] If the patient develops even mild symptoms of a general reaction, observation should be extended until they are completely resolved. The observation period should also be extended for patients at high risk of reactions.

Of 12 samples of *Aspergillus* extract used for allergen immunotherapy, 4 were found to contain aflatoxin (p.2249), one being highly mutagenic as determined by the Ames' test. The results suggested that careful screening of commercially available mould extracts was warranted.[7]

Precautions

Patients should be observed for at least 30 to 60 minutes after administration of allergen products because of the risk of anaphylaxis (see also under Adverse Effects, above). Patients should avoid taking beta blockers since adrenaline may be ineffective if hypersensitivity reactions occur. Antiallergic medication taken concomitantly may mask the patient's reactivity.

Skin-prick testing should not be carried out in areas where there are skin lesions. Patients should be instructed not to rub or scratch the test site. Antiallergic medication should be stopped before allergen testing to prevent false negative reactions. Systemic or long-term topical use of potent corticosteroids may also mask skin reactivity.

Allergen immunotherapy should not be used in patients with serious immunological illness, cancer, disorders of amino acid metabolism, bleeding disorders, or hyperthyroidism. It should also be avoided during infections or febrile conditions, and administration of an allergen preparation delayed for 24 to 48 hours after recovery. Allergen immunotherapy should be avoided during pregnancy because of the risk to the fetus of any systemic reactions in the mother. Patients with asthma may be more susceptible to hypersensitivity reactions with allergen products and it is considered that allergen immunotherapy should be avoided or used with caution. Injection immunotherapy should be avoided in children under 6 years of age, and sublingual immunotherapy in children under 2 years. Sublingual immunotherapy is contra-indicated in patients with severe oral inflammatory conditions such as lichen planus with ulcerations, or severe mycosis. Sublingual immunotherapy should be stopped for 7 days in patients who have oral surgery, including dental extraction, to allow the wounds to heal.

Allergen immunotherapy should be avoided or used with caution in patients with cardiovascular or pulmonary insufficiency, or severe eczema. Rarely, patients may experience drowsiness with allergen immunotherapy preparations and, if affected, should avoid driving or operating machinery.

Allergen immunotherapy injections should only be given where facilities for full cardiopulmonary resuscitation are immediately available. Injections for immunotherapy should be given subcutaneously and not intravenously or intramuscularly. Patients should avoid strenuous exercise for at least 12 hours after injection immunotherapy, or 1 hour before and after sublingual immunotherapy. It is also recommended to avoid heavy meals and alcohol around the time of injection with some products. Severe anaphylactoid reactions have been reported in patients undergoing allergen immunotherapy who are also receiving ACE inhibitors (see Hypersensitivity, p.1195). Some manufacturers suggest that the reaction could be avoided by temporarily withholding ACE inhibitor therapy during each desensitisation. Allergen immunotherapy preparations and vaccines against infectious diseases should not be given within at least a week of each other or until all possible reactions to either vaccine have disappeared.

Interactions

For precautions to be observed in using allergen products in patients receiving ACE inhibitors, antiallergic drugs, beta blockers, or vaccines see Precautions, above.

Uses and Administration

Allergen products are used diagnostically in skin tests and provocation tests to confirm the cause of a suspected hypersensitivity reaction. They are also used for allergen immunotherapy in certain patients with hypersensitivity reactions, particularly to insect venoms such as bee or wasp venom, pollen (p.2370), house dust, and house-dust mite. Preparations for allergen immunotherapy are given by subcutaneous injection or sublingually. Other routes (such as oral, nasal, or bronchial) have also been tried.

Administration. Allergen vaccines used for allergen immunotherapy (see below) should be well characterised and standardised for total allergenic potency, biological activity, and shelf-life. Whenever possible, the same batch of allergen should be used during a course of treatment because of possible differences in potency between batches. Injections for allergen immunotherapy are given subcutaneously as aqueous extracts or combined with adjuvants to reduce adverse effects while retaining or enhancing immunogenicity. Such modified vaccines are slow-release formulations and therefore the interval between injections is increased. Vaccines can be physically modified by adsorption onto an inert carrier such as aluminium or calcium salts, or tyrosine, or chemically modified with glutaral, formaldehyde, or liposomes. Combinations of the two types of modified vaccine may also be used.

Dosage regimens for allergen immunotherapy are as recommended by the manufacturers and depend on the sensitivity of the patient. During the initial build-up phase, the dose of allergen vaccine is slowly increased (by increasing the concentration and/or the dose volume) until the maintenance dose is reached. However, the dose should be reduced after a systemic reaction, or stopped if the reaction is severe. Likewise, the dose might need to be reduced or not given at all to highly sensitised patients during periods of natural exposure to the allergen.

In *conventional* build-up schedules, injections of aqueous extracts are given once or twice weekly, with maintenance expected to be reached in 4 to 6 months. Depot preparations are given every 1 to 2 weeks. *Modified dosage schedules* have been used where maintenance needs to be achieved more quickly; such regimens may, however, be associated with an increased risk of adverse reactions, although this can be ameliorated by premedication with an antihistamine. Aqueous extracts should be used for modified schedules until the maintenance dose is reached. In *cluster schedules* several injections may be given on the same day, usually at 30-minute intervals, once or twice a week on non-consecutive days. Fewer total injections are used than with conventional schedules and maintenance therapy can be reached in as little as 4 weeks. There might be a slight increase in risk of systemic reactions. *Rush schedules* are more rapid than cluster schedules and several injections are given at specified intervals once daily on consecutive days allowing maintenance doses to be reached in a matter of days; naturally, this does increase the risk of systemic adverse effects and patients need to be monitored more closely and for longer than with conventional schedules. *Ultrarush schedules* are even faster and may be used to accelerate desensitisation to stinging insects in highly sensitive individuals. When the maintenance dose has been reached, the injection interval is progressively increased as necessary according to safety and efficacy. Injection intervals are typically 2 to 4 weeks for aeroallergens and 8 weeks for insect venom. The optimal duration of allergen immunotherapy is unknown, but a period of 3 to 5 years is usually recommended; the decision to discontinue therapy will depend on individual response. Some patients will remain desensitised after stopping allergen immunotherapy but others will relapse.

The sublingual route is also used for allergen immunotherapy, with the vaccine given daily either as a solution or as oral lyophilisate tablets. It is considered to be a good alternative to the subcutaneous route in terms of safety and efficacy, although problems of determining the optimal vaccine dose in relation to efficacy and duration of treatment still remains to be established. The oral, nasal, and bronchial routes have also been tried for allergen immunotherapy, although efficacy or safety has not always been demonstrated.

Modification of allergens is being investigated as an alternative way to increase safety and efficacy, and developments include recombinant proteins, peptides, plasmid DNA vaccines, and immunostimulatory sequences of DNA conjugated to specific allergens. Other immunomodulatory methods include use of allergen-specific antibodies or fragments, and humanised anti-IgE monoclonal antibodies (e.g. omalizumab, p.1128). Also, more efficient adjuvants such as monophosphoryl lipid A are being tried.

Allergen immunotherapy. Allergic reactions are type I (immediate) hypersensitivity reactions mediated by IgE antibodies (see under Hypersensitivity, p.561) that are usually managed by anti-allergic medication or, where possible, allergen avoidance. For patients in whom these treatment methods are inadequate or unsuitable, allergen immunotherapy (desensitisation or hyposensitisation) may be tried. Specific allergen immunotherapy (SIT) is the administration of gradually increasing quantities of an allergen vaccine to a patient with diagnosed IgE-mediated allergy until a maintenance dose is reached that is effective in ameliorating symptoms associated with subsequent exposure to the allergen.[1-4] The mechanism of action is thought to be through T-helper (Th) cell switching by rectifying the balance between Th1 and Th2 lymphocytes and increasing the levels of protective IgG while decreasing the levels of IgE.[2,4-6] Long-lasting benefit is conferred, and the quality of life improved in patients for whom allergen avoidance is difficult or impossible. Patients must have demonstrable evidence of specific IgE antibodies before undergoing allergen immunotherapy (see Diagnostic Use below), and it is generally recommended that diagnosis of allergies and allergen immunotherapy should only be carried out in specialist centres. Subcutaneous injection immunotherapy (SCIT) is the traditional method of administration and has a long history of use. Sublingual immunotherapy (SLIT) is now also widely used, and other routes have been tried — see Administration, above. Reports of severe and sometimes fatal hypersensitivity reactions to injected allergen preparations prompted recommendations to reduce the risk of systemic reactions (see under Adverse Effects, above).

The use of allergen immunotherapy has been reviewed[4,7] and recommendations have been published.[2,3,8,9] The incidence and severity of allergic disease is increasing as a result of environmental changes, and allergies represent a major cause of illness in developed countries; in the UK for example, they are estimated to affect 1 in 3 people. Of particular concern is the rise in multi-system allergies.[4] Common sources of allergens include: pollen and fungal spores producing seasonal allergic rhinitis and conjunctivitis (hay fever); house dust, house-dust mites, and animal dander producing perennial allergic rhinitis; venom from bees, wasps, and stinging ants; latex rubber, flour, and other allergens giving rise to occupational rhinitis; drugs (e.g. penicillins, anaesthetics); and some foods (e.g. nuts, shellfish).[4] Allergic reactions are a common cause of childhood asthma and are also associated with atopic eczema.[4]

Not all allergies are suitable for treatment with specific allergen immunotherapy and recommendations made by the CSM[10] in the UK are that allergen immunotherapy should only be used for seasonal allergic rhinitis (hay fever) in patients not responsive to anti-allergic drugs, and for hypersensitivity to bee and wasp venoms; warnings against use in patients with asthma are also given (although allergen immunotherapy is used in some countries for the treatment of allergic asthma — see below). The UK CSM[10] also concludes that there is inadequate evidence of benefit from desensitisation to allergens such as house dust, house-dust mites, animal dander, and foods, and therefore does not recommend allergen immunotherapy in these cases.

Allergen immunotherapy is used in **children** and is thought to be more effective than in adults.[2] It has been suggested that its use in children with allergic rhinoconjunctivitis may also prevent the development of asthma.[3] Review of controlled studies and meta-analyses[11] confirmed that allergen injection immunotherapy is effective in allergic asthma in children, and early intervention may prevent progression to multiple allergen hypersensitivity. However, since adverse effects of allergen immunotherapy are more likely in asthmatics, it is contra-indicated in unstable asthma (see also below). Therapy is generally not recommended for children younger than 5 or 6 years of age[2,3,8] because it is less well tolerated, cooperation with a young child might be difficult,[3] and in this age group the differential diagnosis between allergic rhinitis and viral infection of the respiratory tract may not be clear.[2]

Allergen immunotherapy for seasonal **allergic rhinitis** and **conjunctivitis** triggered by pollen has generally been reserved for severely affected patients when anti-allergic drugs have failed.[2,3,8] A systematic review[5] of controlled studies concluded that there is a significant reduction in symptoms and use of medication in suitably selected patients who have not responded adequately to anti-allergic drugs, together with a known and relatively low risk of serious adverse effects with no long-term consequences. The sublingual route is a means of ameliorating the severe systemic reactions associated with injection immunotherapy. A systematic review[6] of studies using sublingual immunotherapy in patients with seasonal and perennial allergic rhinitis supported the promotion of this route because rhinitis symptoms and use of anti-allergic medication were reduced significantly in adults and no systemic adverse effects were reported. However, it was difficult to assess the magnitude of the effect and compare this route with injection immunotherapy. The treatment effect in children was not significant. However, a meta-analysis[12] of more controlled studies involving a greater total number of children concluded that sublingual immunotherapy was effective in children with allergic rhinitis.

There is some evidence that allergen immunotherapy for allergies such as rhinitis may prevent the development of **asthma**[3] and thus earlier use may be warranted.[13] A systematic review[14] of randomised controlled studies confirmed that allergen immunotherapy in asthmatic patients reduced the symptoms of asthma and the use of asthma medication, although it was not possible to quantify the benefits compared with other forms of therapy, and the possibility of severe or fatal anaphylaxis remains. Recommendations for the use of allergen immunotherapy in patients with asthma vary. Guidelines issued in the UK[10] in 1994 recommended that asthmatic patients should not be treated with allergen immunotherapy because they are more likely to develop severe adverse effects (although asthma is not considered a contra-indication to allergen immunotherapy for anaphylaxis caused by Hymenoptera spp.). Others,[3,9] including WHO,[2] consider that allergen immunotherapy for allergic rhinoconjunctivitis can be given to patients whose asthma is stable and not severe (FEV_1 is not less than 70% of predicted value),[2] when avoidance of allergens has not been sufficient or is not possible, and drug treatment has failed. Allergen immunotherapy should not be given to patients whose asthma can be controlled by antiasthmatic drugs and allergen avoidance.[15]

Allergen immunotherapy is indicated for patients with specific IgE antibodies who have experienced severe anaphylaxis after **insect stings**, particularly those of Hymenoptera (bees, wasps, and stinging ants).[2,3,8,16,17] Vaccines containing purified venom are available for most Hymenoptera spp. and have replaced whole body extract preparations, which were generally found to be ineffective. Venom immunotherapy is very effective in decreasing the risk of systemic reactions to venom in susceptible people.[17] Venom vaccines are not available for stinging ants but whole body extract vaccines may contain sufficient venom antigens to be effective.[2,3,17] Allergen immunotherapy for rhinoconjunctivitis and asthma due to house-dust mite or animal dander can be considered when the allergen is unavoidable.[2,3,9,14] A review[18] considering both injection and sublingual mite immunotherapy in adults and children with asthma and/or rhinitis confirms efficacy, although it is not possible to assess safety relative to other forms of allergen immunotherapy such as pollen vaccines. One multicentre, randomised, dose-response study[19] found that specific mite injection immunotherapy for 1 year improved eczema in patients with atopic dermatitis allergic to house-dust mite. Limited data indicate that allergen immunotherapy might be effective for atopic dermatitis associated with aeroallergen sensitivity.[3] However, more controlled studies are needed to confirm its place in treatment.[4]

Allergen immunotherapy for **drug hypersensitivity** may be warranted on the rare occasions when continued use is considered essential, possibly with penicillins or insulin.[8,20] In most cases the effect of desensitisation is temporary and if the medication is required again in the future, the process must be repeated.[21]

Allergen immunotherapy has also been tried in **other disorders** such as urticaria and food allergies, but there is insufficient evidence to support such use[3,4,8,10] and its use is not recommended. The traditional method of allergen immunotherapy in peanut allergy has an unacceptably high rate of systemic adverse reactions and other immunotherapeutic interventions are being sought.[22]

Diagnostic use. Sensitivity testing can be used to confirm that suspected allergens are mainly responsible for the symptoms of a suspected hypersensitivity reaction. It is necessary before patients with allergies are managed either by allergen avoidance or treated with allergen immunotherapy (see above). However, sensitivity testing should not form the sole basis of the treatment of hypersensitivity reactions.

Type IV (delayed) hypersensitivity reactions such as contact dermatitis are normally diagnosed using patch tests. A number of standard techniques are available, but in general they all involve maintaining a standard amount of the test substance in contact with the skin for 48 to 72 hours. A positive response is shown by erythema, swelling, or vesiculation. The sensitivity of different parts of the body varies, and this should be accounted for in applying test substances and controls. The test results are normally read 30 to 60 minutes after removal of the patches to allow any pressure effects of the patches to subside. Patch testing with mixtures of allergens may be necessary to diagnose contact dermatitis in patients hypersensitive to multiple allergens.

Type I (immediate) hypersensitivity reactions such as allergic rhinitis, allergic asthma, and insect-sting hypersensitivity are tested using skin-prick or intradermal tests. Since the allergen is introduced through the skin in these tests, the risk of systemic reactions is greater than patch testing, and adrenaline injection should be kept available. The skin-prick test involves pricking the epidermis through a drop of allergen in solution, and comparing the result after 15 to 20 minutes with positive and negative controls. This test is inexpensive and the results available rapidly. The intradermal (intracutaneous) test is used if the skin-prick test result does not agree with a strong clinical suspicion, although now that potent allergen extracts are used for skin-prick tests, the intradermal test offers few advantages and has greater risk of systemic reactions. Skin testing is unreliable for evaluating hypersensitivity to drugs, except for penicillins and for certain macromolecules. Skin test titration, that is testing with a series of dilutions, has been used to determine a safe starting dose for allergen immunotherapy.

Provocation tests are designed to reproduce symptoms of hypersensitivity by controlled exposure to a suspected allergen. They are used when skin or laboratory tests are unavailable, or IgE is not involved in the mechanism. Provocation may be by the bronchial, oral, nasal, or ocular routes. Facilities for full cardiopulmonary resuscitation should be immediately available.

In-vitro methods for measuring antigen-specific IgE include immunoassays such as the enzyme-linked immunosorbent assay (ELISA), which has now replaced the radioallergosorbent test (RAST). These tests can be used in place of skin-prick tests but they are expensive and the results not available as quickly.

Almond Oil

Aceite de Almendra; Almendras dulces, aceite de; Amande, huile d'; Amygdalae oleum; Badem Yağı; Bitter Almond Oil; Expressed Almond Oil; Huile d'Amande; Mandelöl; Mandelolja; Mandlový olej; Mandulaolaj; Manteliöljy; Migdolų aliejus; Ol. Amygdal.; Olej migdałowy; Oleo de Amêndoas; Olio di Mandorla; Sweet Almond Oil.

CAS — 8007-69-0.

Pharmacopoeias. In *USNF.*
Eur (see p.vii) includes the virgin oil and a refined oil.
Fr. also specifies Huile de Noyaux, an oil obtained from various species of *Prunus.*

Ph. Eur. 6.2 (Almond Oil, Virgin; Amygdalae Oleum Virginale). A yellow, clear, liquid. It is the fatty oil obtained by cold expression from the ripe seeds of *Prunus dulcis* var. *amara* or *P. dulcis* var. *dulcis* or a mixture of both varieties. Slightly soluble in alcohol; miscible with petroleum spirit. Store in well-filled containers. Protect from light.

Ph. Eur. 6.2 (Almond Oil, Refined; Amygdalae Oleum Raffinatum). The fatty oil obtained by refining and deodorisation of Almond Oil. It may contain a suitable antoxidant. A pale yellow, clear, transparent liquid. Slightly soluble in alcohol; miscible with petroleum spirit. Store in well-filled containers. Protect from light.

USNF 26 (Almond Oil). The refined fixed oil expressed from the kernels of varieties of *Prunus dulcis* [*Prunus amygdalus*] (Rosaceae). It may contain suitable antoxidants. A clear, colourless or pale straw-coloured, oily liquid with a bland taste. Slightly soluble in alcohol; miscible with chloroform, with ether, with petroleum spirit, and with benzene. Store in well-filled, airtight containers. Protect from light.

Profile

Almond oil, which consists mainly of glycerides of oleic acid with smaller amounts of linoleic and palmitic acid, has nutritive and demulcent properties. It is used as an emollient and to soften ear wax. It is also used as a vehicle in some injections.

Preparations

BP 2008: Almond Oil Ear Drops;
USP 31: Rose Water Ointment.

Alpha Galactosidase A

α-D-Galactosidase; α-Galactosidase A; α-D-Galactoside Galactohydrolase.

Agalsidase Alfa *(BAN, USAN, rINN)*

Agalsidasa alfa; Agalsidasum Alfa.

Агальсидаза Альфа

CAS — 104138-64-9 (protein moiety).
ATC — A16AB03.
ATC Vet — QA16AB03.

Agalsidase Beta *(rINN)*

Agalsidasum Beta; Agalsidaz Beta; Alfasidasa β.

Агальсидаза Бета

CAS — 104138-64-9 (protein moiety).
ATC — A16AB04.
ATC Vet — QA16AB04.

Adverse Effects, Treatment, and Precautions

IgG antibodies to agalsidase alfa develop in some patients, and to agalsidase beta in the majority of patients. The presence of antibodies increases the risk of infusion reactions. Infusion reactions have been reported in about 14% of patients given agalsidase alfa, and in about 67% of patients treated with agalsidase beta. The frequency of the onset of these reactions decreases with continued use, with the majority of reports occurring during the first 2-4 months after the start of treatment, although onset after 1 year has also been reported. Symptoms generally start during, or within 1 hour of, infusion. The most common symptoms have included chills, dyspnoea, facial flushing, headache, nausea, fever, and fatigue. The infusion may be interrupted for about 5 to 10 minutes and restarted once symptoms have subsided. Pretreatment with oral antihistamines, paracetamol, ibuprofen, and/or corticosteroids 1 to 24 hours before infusion has been used to prevent subsequent reactions. Patients with compromised cardiac function should be monitored closely since they may be predisposed to a higher risk of severe complications arising from infusion reactions.

Interactions

Agalsidase alfa or beta should not be used with amiodarone, chloroquine, monobenzone, or gentamicin, which all have the potential to inhibit intracellular α-galactosidase activity.

Pharmacokinetics

The pharmacokinetic properties of agalsidase alfa appear to be unaffected by dose; the elimination half-life from blood following a single dose has been reported to be about 100 minutes. The pharmacokinetics of agalsidase beta indicate a saturated clearance; the elimination half-life following a single dose has been reported to range from 45 to 100 minutes.

◊ Most pharmacokinetic parameters of agalsidase alfa in children with Fabry disease were similar to those in adult patients after single and repeated doses, except for serum clearance, which was age dependent being significantly increased in children.[1] However, there was no difference in pharmacodynamics between the age groups.

1. Ries M, *et al.* Enzyme replacement in Fabry disease: pharmacokinetics and pharmacodynamics of agalsidase alfa in children and adolescents. *J Clin Pharmacol* 2007; **47:** 1222–30.

Uses and Administration

Alpha galactosidase A is an endogenous enzyme that hydrolyses terminal α-D-galactose residues in oligosaccharides and galactolipids into more easily digestible mono- and disaccharides. A form derived from a fungal source is used to prevent intestinal gas.

Agalsidase alfa and beta are recombinant forms of alpha galactosidase A used for the long-term enzyme replacement therapy of Fabry disease (see below).

Agalsidase alfa is given by intravenous infusion in a dose of 200 micrograms/kg over 40 minutes, repeated every alternate week.

Agalsidase beta is given by intravenous infusion in a dose of 1 mg/kg at an initial rate of no more than 250 micrograms/minute; the rate of administration may be gradually increased (by 50 to 80 micrograms/minute in each subsequent infusion) once tolerance has been established. The dose should be repeated every alternate week.

Fabry disease. Fabry disease (Anderson-Fabry disease) is a rare X-linked recessive lysosomal storage disorder.[1-6] It predominantly affects males, although female carriers may sometimes have clinical manifestations.[4,5] It is characterised by a deficiency of the enzyme alpha galactosidase A resulting in the intracellular accumulation of globotriaosylceramide (Gb_3) and other glycosphingolipids, especially in vascular endothelium and smooth muscle. Symptoms include severe neuropathies, fevers, skin blemishes (angiokeratomas), corneal and lenticular opacities, and gastrointestinal disturbances. Cardiac, cerebrovascular, and renal deterioration is progressive placing patients at increased risk for early-onset myocardial infarction, stroke, and renal failure.

Symptomatic treatment was the only option until the development of enzyme replacement therapy with agalsidase alfa[7] and beta.[8] Results from controlled studies show this form of therapy to be effective in clearing deposits from the kidneys, heart, and skin[9-12] as well as improving peripheral neuropathy.[13] An open-label extension study[14] of agalsidase beta in the 58 patients formerly studied in a 20-week controlled phase III study[11] confirmed the continued safety and efficacy of enzyme replacement therapy after 30 months of treatment. Benefit continued in these patients followed up for a further 24 months,[15] and kidney biopsies in 8 of the patients confirmed complete clearance of globotriaosylceramide. The cardiac effects of Fabry disease have been reviewed,[16] and both agalsidase alfa and beta have been reported to improve left ventricular structure and function, although further studies are required. Although most studies have been in adults, enzyme replacement therapy has been shown to be safe in children over 6 years of age.[17] Expert opinion generally recommends that treatment is begun as soon as clinical signs and symptoms are observed.[5,18] Gene therapy[19] is also under investigation.

Alpha$_1$-proteinase Inhibitor

Alpha$_1$ Antitrypsin; alpha-1-Antitrypsinum; Antitrypsine alpha-1; Inhibidor de la α_1- proteinasa.

ATC — B02AB02.

ATC Vet — QB02AB02.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Human α-1-Proteinase Inhibitor). A plasma protein fraction containing mainly human α-1-proteinase inhibitor. It is prepared from human plasma obtained from blood from healthy donors; the plasma is tested for the absence of hepatitis B surface antigen and antibodies against HIV-1 and HIV-2 and hepatitis C virus. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection. Other plasma proteins may be present. Freeze-dried products are hygroscopic, white or pale yellow or pale brown powders or friable solids; liquid products are clear or slightly opalescent, colourless or pale yellow or pale green or pale brown. pH of 6.5 to 7.8. Store in airtight and sterile containers at a temperature not exceeding 25°.

Adverse Effects and Precautions

Adverse effects of intravenous alpha$_1$-proteinase inhibitor include asthenia, chills, increase in cough, dizziness, dyspnoea, flu-like symptoms, headache, hypotension, pain at the injection site, paraesthesias, pharyngitis, pruritus, rashes, somnolence, and tachycardia. The infusion should be interrupted or the rate reduced if adverse effects occur and resumed at a more tolerable rate once the symptoms have subsided; the infusion should be stopped immediately in the event of anaphylactic or anaphylactoid reactions, and full supportive measures implemented. Preparations derived from pooled human plasma carry a risk of transmission of infection (see Blood, p.1056).

The drug is contra-indicated in patients with selective IgA deficiencies who have known antibody against IgA since they are at risk of severe reactions to IgA that may be present in the product.

Uses and Administration

Endogenous alpha$_1$-proteinase inhibitor is a serum glycoprotein synthesised in the liver that acts as an elastase inhibitor, primarily inhibiting neutrophil elastase. Alpha$_1$-proteinase inhibitor, prepared from pooled human plasma, is used as replacement therapy in patients with emphysema who have congenital alpha$_1$ antitrypsin deficiency (see below). It is given in a dose of 60 mg/kg once a week by intravenous infusion at a rate of about 0.08 mL/kg per minute (usually corresponding to a 15 to 30 minute infusion).

A recombinant form of alpha$_1$-proteinase inhibitor is under investigation for nebulised delivery in congenital alpha$_1$ antitrypsin deficiency and cystic fibrosis (see below).

Alpha$_1$-proteinase inhibitor has also been investigated for the prevention of bronchopulmonary dysplasia (p.1500) in preterm neonates.

Alpha$_1$ antitrypsin deficiency. Alpha$_1$ antitrypsin deficiency (alpha$_1$-proteinase inhibitor deficiency) is characterised by chronic obstructive pulmonary disease (COPD) and chronic liver disease associated with a lack of alpha$_1$-proteinase inhibitor.[1] This inhibitor is produced in the liver but exerts its main effects in the lungs as an inhibitor of neutrophil elastase, an enzyme released in response to inflammation. Congenital deficiency of the inhibitor thus leaves the lungs vulnerable to destruction by elastase, leading to the development of emphysema (see Chronic Obstructive Pulmonary Disease, p.1112), usually in the third or fourth decade of life. Hepatic manifestations of deficiency include hepatitis, cirrhosis, and hepatoma. Panniculitis and vasculitis may also occur less frequently in some phenotypes.[2,3]

Management of COPD associated with the deficiency involves avoidance of factors (mainly cigarette smoking) that cause pulmonary inflammation, and supportive treatment with bronchodilators and oxygen as appropriate. Augmentation therapy with alpha$_1$-proteinase inhibitor to raise serum concentrations above the protective threshold is also of benefit in some patients.[2,4] Intravenous infusion of the drug has been shown to correct the biochemical abnormality[5] and has been recommended in those patients with some deterioration of lung function.[2,6] In a short-term study[7] serum and secretion concentrations of alpha$_1$-proteinase inhibitor as well as markers of neutrophilic inflammation were monitored in 12 patients receiving augmentation therapy over 4 weeks. Results demonstrated a rise in serum levels of alpha$_1$-proteinase inhibitor to above the protective threshold, and reduction in elastase activity and levels of leukotriene B_4 levels (thought to be important in producing airway inflammation in alpha$_1$ antitrypsin deficiency). A small placebo-controlled study[8] found that the rate of decline of FEV_1 was not affected in patients treated for at least 3 years. Data[9] from a large registry of patients also suggested that, overall, treatment did not affect the rate of decline of FEV_1, but that it decreased mortality, although this may be influenced by other factors. Evaluation[6] of 2 of these studies[8,9] and one other concluded that replacement therapy might reduce the progression of disease in selected patients, but that further randomised placebo-controlled studies were required to provide conclusive evidence for overall clinical efficacy. The Canadian Thoracic Society[10] recommends that replacement therapy should be reserved for patients with an FEV_1 between 35 and 65% predicted who are no longer smoking and on optimal medical therapy but continuing to show a rapid decline in FEV_1. In a retrospective cohort study[11] in 96 patients followed up for a minimum of 12 months, results indicated that the rate of progression of pulmonary emphysema was reduced during the time that the patients received augmentation therapy, and patients with well-maintained lung function and a rapid decline in FEV_1 benefited most from therapy. These authors recommended early diagnosis to identify patients at risk and to start augmentation even if lung function is greater than 65% predicted.

Liver involvement does not respond to treatment with alpha$_1$-proteinase inhibitor and is managed symptomatically.[2]

Several new approaches to treatment of alpha$_1$ antitrypsin deficiency are under investigation:[2,3,12] plasma-derived and recombinant forms of alpha$_1$-proteinase inhibitor for inhalation; synthetic elastase inhibitors for oral use; synthetic chaperones to block intrahepatic polymerisation of the inhibitor and other methods to improve serum concentrations; retinoids; inhaled hyaluronic acid; and gene therapy.

Cystic fibrosis. Some of the inflammatory damage that occurs in the lungs of patients with cystic fibrosis is thought to be caused by excessive amounts of elastase released locally. Alpha$_1$-proteinase inhibitor given by nebuliser is therefore under investigation[1-3] in patients with cystic fibrosis (p.166).

CAS — 7784-24-9 (alum dodecahydrate); 10043-67-1 (anhydrous alum).
ATC — S01XA07.
ATC Vet — QS01XA07.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Jpn,* and *US.*
US also includes dodecahydrated ammonia alum (Ammonium Alum). *Jpn* also includes dried alum.

Ph. Eur. 6.2 (Alum). Colourless, transparent, crystalline masses or a granular powder. Freely soluble in water; very soluble in boiling water; practically insoluble in alcohol; soluble in glycerol. A 10% solution in water has a pH of 3.0 to 3.5.

USP 31 (Potassium Alum). A white powder or large, colourless crystals or crystalline fragments. It is odourless. Soluble 1 in 7 of water and 1 in 0.3 of boiling water; insoluble in alcohol; freely but slowly soluble in glycerol. Its solutions are acid to litmus. Store in airtight containers.

Adverse Effects

Large doses of alum are irritant and may be corrosive; gum necrosis and gastrointestinal haemorrhage have occurred. Systemic absorption from bladder irrigation solutions can cause acute aluminium toxicity (see under Aluminium below) including encephalopathy.

◊ Acute encephalopathy has been reported[1,2] after bladder irrigation with alum solutions in the treatment of bladder haemorrhage. Anecdotal evidence would suggest that this practice should be avoided in patients with renal insufficiency.[1]

1. Phelps KR, *et al.* Encephalopathy after bladder irrigation with alum: case report and literature review. *Am J Med Sci* 1999; **318:** 181–5.
2. Nakamura H, *et al.* Acute encephalopathy due to aluminium toxicity successfully treated by combined intravenous deferoxamine and hemodialysis. *J Clin Pharmacol* 2000; **40:** 296–300.

Uses and Administration

Alum precipitates proteins and is a powerful astringent. It is often included in preparations used as mouthwashes or gargles and in dermatological preparations.

Alum, either as a solid or as a solution, may be used as a haemostatic. Intravesical instillation of alum, typically as a 1% solution, has been used as a treatment for haemorrhagic cystitis (p.2178).

Alum is also used as a mordant in the dyeing industry.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Citramin†.

Multi-ingredient: ***Arg.:*** Bentophyto; ***Austria:*** EST; ***Braz.:*** Lucretin; ***Canad.:*** Fletchers Sore Mouth Medicine; ***Ger.:*** Retterspitz Ausserlich; Retterspitz Innerlich; ***India:*** Feel Chill; ***Ital.:*** Lavanda Sofar; ***Mex.:*** Forcremol; ***Neth.:*** Trachitol; ***NZ:*** Grans Remedy; ***Spain:*** Co Bucal; Lindemil; ***USA:*** BFI; Massengill; Mycinette; ***Venez.:*** Borogin.

Aluminium

Aluminio; Aluminum; E173; Glin.

Al = 26.9815386.
CAS — 7429-90-5.

Description. Aluminium is a malleable and ductile soft silvery-white metal, becoming coated with a thin layer of oxide.

Pharmacopoeias. *Br.* includes Aluminium Powder.

BP 2008 (Aluminium Powder). An odourless or almost odourless, silvery-grey powder. It consists mainly of metallic aluminium in very small flakes, usually with an appreciable quantity of aluminium oxide. It is lubricated with stearic acid to protect the metal from oxidation. Practically insoluble in water and in alcohol; it dissolves in dilute acids and in aqueous solutions of alkali hydroxides, with the evolution of hydrogen.

Handling. Aluminium powder has been used for the illicit preparation of explosives or fireworks; care is required with its supply.

Incompatibility. Incompatibilities have been reported between aluminium in injection equipment and metronidazole,[1,2] and between aluminium and various antineoplastics including cisplatin, daunorubicin, and doxorubicin.[3-6] The suitability of aluminium caps for sugar-containing liquids has also been questioned. Abrasion of the aluminium cap by sugar from *Ceporex Syrup* [cefalexin] has resulted in the formation of a black slime.[7]

Adverse Effects, Treatment, and Precautions

Aluminium toxicity is well recognised in patients with renal impairment. Patients undergoing dialysis have experienced encephalopathy, osteodystrophy, and anaemia associated with an aluminium salt taken as a phosphate binder or with aluminium present in the water supply. For this reason, aluminium-free phosphate binders are often used in dialysis patients and the concentration of aluminium in dialysis fluid has been limited to not more than 10 micrograms/litre (see Aluminium Overload under Dialysis Solutions, p.1671). Serum-aluminium concentrations should be monitored regularly in patients undergoing dialysis.

Aluminium toxicity has followed the use of parenteral fluids and infant feeds with a high concentration of aluminium.

Aluminium toxicity may be treated by removal of the aluminium with desferrioxamine (p.1441).

The adverse effects of aluminium salts and precautions to be observed are described under Aluminium Hydroxide, p.1706.

◊ A review of aluminium toxicity[1] lists possible sources of aluminium including water, antacids, phosphate-binding gels, total parenteral nutrition solutions, processed human serum albumin, fluids used in infants, and environmental pollution; cooking utensils and beverages such as tea have also been suggested as possible sources of aluminium. It has been suggested that over-the-counter preparations of antacids, which can contain significant amounts of aluminium, represent the most important quantitative source of aluminium exposure.[2] Toxicity tends to occur when the gastrointestinal barrier to aluminium absorption is circumvented, as in intravenous fluid use or dialysis, or if the excretion of aluminium is reduced, as in renal impairment. Infants, especially preterm infants, form a special risk group.[3-6]

Accidental deposition of 20 tonnes of aluminium sulfate in a reservoir in Cornwall, UK in 1988 led to contamination of a nearby town's water supply.[7] Symptoms reported included diarrhoea, mouth ulcers or blisters, malaise, joint symptoms (mainly deterioration of existing symptoms), and memory defects (usually beginning 2 to 3 months after the incident). Although some medical experts considered that no long-term toxic effects were to be expected,[7] aluminium deposits were found in the bones of 2 individuals 6 to 7 months later.[8] In a study[9] undertaken 3 years after the incident, 55 adults who claimed to have suffered cerebral damage performed poorly in psychomotor testing. The authors attributed this to aluminium exposure, but the study's design and conclusions have been criticised.[10-12] An inquiry by the UK DoH[13] does not anticipate that exposure to aluminium from this incident would have caused long-term health problems in people who were adults or toddlers at the time, although this possibility should be explored further in those who were bottle-fed infants (i.e. below one year of age) at that time. Further studies have also been recommended on the neuropsychological status and prevalence of joint problems in the population who consumed the contaminated water.

Burns. Thermal burns have been reported in patients undergoing magnetic resonance imaging (MRI) procedures when wearing transdermal medication patches containing aluminium in the backing material.[1] Aluminium is a conductive material and could induce a concentration of electrical currents sufficient to cause serious burns if placed in the MRI field; a similar phenomenon could also occur with external defibrillation.

1. Health Canada. Association of transdermal drug patches with thermal burns during magnetic resonance imaging procedures (issued 26th April 2005). Available at: http://www.hc-sc.gc.ca/dhp-mps/alt_formats/hpfb-dgpsa/pdf/medeff/mri-irm_patch-timbre_nth-ah_e.pdf (accessed 03/04/08)

Effects on mental function. Encephalopathy with seizures has been associated with the use of aluminium-containing materials used for bone reconstruction.[1,2] In each case, reconstruction of areas of the skull resulted in high concentrations of aluminium in the CSF.

ALZHEIMER'S DISEASE. The role of aluminium in the aetiology of Alzheimer's disease (see Dementia, p.362) is, at best, unclear.[1-4] Circumstantial evidence of a positive association arises from *animal* and *in-vitro* data, together with clinical observations that aluminium is present in senile plaques and neurofibrillary tangles occurring in Alzheimer's disease, that giving aluminium chelators to Alzheimer patients may slow the progression of the disease, and that the risk of brain changes is increased in people living in areas with a high aluminium content in the drinking water supply. Some of these findings have been criticised, disproved, or not confirmed by other workers. Listed below are some of the studies which point to an association between aluminium intake and Alzheimer's disease,[5-8] some criticisms,[9-13] and some negative findings.[14,15]

There does not appear to be a risk of aluminium accumulation from normal use of aluminium-containing antacids by patients with normal renal function; consequently use of these antacids by such patients should not be considered to put them at risk of Alzheimer's disease.[16,17]

Uses and Administration

Aluminium is used in packaging and in injection equipment. The foil is also used as a dressing and for insulation. Aluminium may also be employed as a colouring agent for some foodstuffs. Aluminium powder alone and in paste form with zinc oxide has been used as a dressing. Astringent aluminium salts are used as antiperspirants. Aluminium hydroxide (p.1706) is used as an antacid.

Aluminium oxide (p.1585) has been used as an abrasive agent.

Homoeopathy. Aluminium has been used in homoeopathic medicines under the following names: Aluminium metallicum; Al. met.

Preparations

BP 2008: Compound Aluminium Paste.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Effidrate†; ***Braz.:*** Belagin; ***Fr.:*** Supro; ***Mex.:*** Dicentril; Gavicid†; Ulgel.

Aluminium Acetate

Aluminio, acetato de; Aluminum Acetate.

$C_6H_9AlO_6$ = 204.1.

CAS — 139-12-8.

Profile

Aluminium acetate is prepared from aluminium sulfate and acetic acid.

Solutions containing aluminium acetate are astringent. Ear drops, which correspond to a solution of aluminium acetotartrate in that they are prepared from aluminium sulfate with the aid of acetic acid and tartaric acid, reduce oedema and inflammation of the ear in conditions such as otitis externa (p.182) by producing an acidic environment hostile to pathogenic bacteria; they are also hygroscopic. Solutions, usually prepared from glacial acetic acid and an aluminum subacetate topical solution (which is itself prepared from aluminium sulfate and acetic acid), have also been used in dermatology as astringent lotions for irritating skin conditions.

Various preparations containing aluminium acetate have been known as Burow's creams, emulsions, lotions, or solutions.

Aluminium acetotartrate and aluminium subacetate (basic aluminium acetate) are also used as topical astringents.

Preparations

BP 2008: Aluminium Acetate Ear Drops;
USP 31: Aluminum Subacetate Topical Solution.

Proprietary Preparations (details are given in Part 3)
Canad.: Buro-Sol; ***Ger.:*** Alsol; Alsol N†; Alsol†; Essigsaure Tonerde-Salbe; Essitol; ***Hung.:*** Alsol; ***Pol.:*** Altacet; Altix; ***Switz.:*** Euceta; ***USA:*** Bite Rx; Buro-Sol†; ***Venez.:*** Acid Mantle.

Aluminium Lactate

Aluminio, lactato de. Tris(lactato)aluminium.

$C_9H_{15}AlO_9$ = 294.2.

CAS — 537-02-0; 18917-91-4.

Profile

Aluminium lactate is used in the local treatment of various disorders of the mouth.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Etiaxil; ***Ital.:*** Aluctyl.

Multi-ingredient: ***Israel:*** Aronal Forte; ***Ital.:*** Lacalut; ***Port.:*** Gartun; ***Switz.:*** Deaftol avec lidocaine.

Aluminium Sulfate

Aliuminio sulfatas; Alumiinisulfaatti; Aluminii sulfas; Aluminii Sulfas Hydricus; Aluminio, sulfato de; Aluminium, sulfate d'; Aluminium Sulfuricum; Aluminium Sulphate; Aluminium Trisulphate; Aluminiumsulfat; Alumínium-szulfát; Aluminum Sulfate; E520; Glinu siarczan; Síran hlinitý hydrát.

$Al_2(SO_4)_3,xH_2O$ = 342.2 (anhydrous).

CAS — 10043-01-3 (anhydrous aluminium sulfate); 17927-65-0 (aluminium sulfate hydrate).

Pharmacopoeias. In *Eur.* (see p.vii), *Int.*, and *US.*

Ph. Eur. 6.2 (Aluminium Sulphate). Colourless lustrous crystals or crystalline masses. It contains 51 to 59% of $Al_2(SO_4)_3$. Soluble in cold water; freely soluble in hot water; practically insoluble in alcohol. Store in airtight containers.

USP 31 (Aluminum Sulfate). Contains 54 to 59% of $Al_2(SO_4)_3$. An odourless, white, crystalline powder, shining plates, or crystalline fragments. Soluble 1 in 1 of water; insoluble in alcohol. The pH of a 5% solution in water is not less than 2.9.

Profile

Aluminium sulfate has an action similar to that of alum (p.2254) but is more astringent. A 20% solution is used for the treatment of envenomation by certain insects and marine organisms. The aluminium may cause precipitation of the proteins contained within the venoms thus reducing local toxicity. Aluminium sulfate is also included in astringent preparations intended to soothe irritating skin conditions.

Aluminium sulfate is also used in the preparation of aluminium acetate solutions.

Adverse effects. Possible adverse effects or toxicity associated with aluminium, or aluminium salts such as aluminium sulfate, in the public water supply are discussed under Aluminium, p.2254.

Preparations

USP 31: Aluminum Subacetate Topical Solution; Aluminum Sulfate and Calcium Acetate for Topical Solution; Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution.

Proprietary Preparations (details are given in Part 3)
Austral.: Stingose; ***Hong Kong:*** Stingose; ***NZ:*** Stingose; ***S.Afr.:*** Stingose†; ***UK:*** Stingose.

Multi-ingredient: ***Arg.:*** Gineseptina†; ***Ger.:*** Tannolil†; ***Hung.:*** Burofix†; ***Mex.:*** Domeboro; ***USA:*** Bluboro†; Boropak†; Domeboro; Ostiderm; Pedi-Boro Soak Paks.

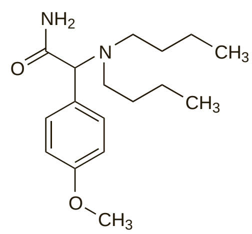
Ambucetamide *(BAN, rINN)*

A-16; Ambucetamida; Ambucétamide; Ambucetamidum; Dibutamide. 2-Dibutylamino-2-(4-methoxyphenyl)acetamide.

Амбуцетамид

$C_{17}H_{28}N_2O_2$ = 292.4.

CAS — 519-88-0.



Profile

Ambucetamide is an antispasmodic and has been given for the relief of dysmenorrhoea. The hydrochloride has also been used.

Preparations

Proprietary Preparations (details are given in Part 3)

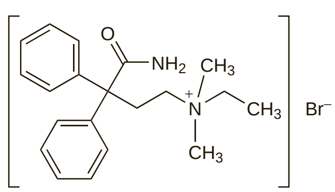
Multi-ingredient: ***Neth.:*** Femerital.

Ambutonium Bromide *(BAN)*

Ambutonii Bromidum; Ambutoniumbromid; Ambutoniumbromidi; BL-700B; R-100. (3-Carbamoyl-3,3-diphenylpropyl)ethyldimethylammonium bromide.

$C_{20}H_{27}BrN_2O$ = 391.3.

CAS — 14007-49-9 (ambutonium); 115-51-5 (ambutonium bromide).



Profile

Ambutonium bromide is a quaternary ammonium antimuscarinic that has been used in gastrointestinal disorders with smooth muscle spasm.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Port.:*** Sedioton†.

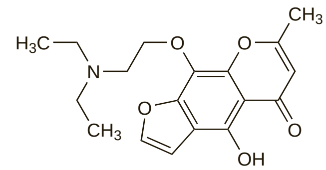
Amikhelline Hydrochloride *(rINNM)*

Amikhelline, Chlorhydrate d'; Amikhellini Hydrochloridum; Hidrocloruro de amikelina. 9-(2-Diethylaminoethoxy)-4-hydroxy-7-methyl-5*H*-furo[3,2-*g*][1]benzopyran-5-one hydrochloride.

Амикеллина Гидрохлорид

$C_{18}H_{21}NO_5,HCl$ = 367.8.

CAS — 4439-67-2 (amikhelline); 40709-23-7 (amikhelline hydrochloride).



(amikhelline)

Profile

Amikhelline hydrochloride has been used as an antispasmodic.

Amilomer *(rINN)*

Amilomère; Amilómero; Amilomerum.

Амиломер

CAS — 42615-49-6.

Profile

Amilomer consists of microspheres produced by reaction of partially hydrolysed starch with epichlorohydrin, quickly degradable by amylase (with a half-life of less than 120 minutes); the name is followed by a hyphenated numerical code in which the number preceding the hyphen indicates the half-life in minutes and that following the hyphen indicates the mean diameter of the microspheres in μm.

Amilomer is used in transarterial chemoembolisation procedures in the management of hepatic malignancies.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Spherex.

Aminohippuric Acid

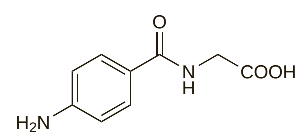
Acidum Aminohippuricum; *p*-Aminobenzoylglycine; *p*-Aminohippuric Acid; Aminohippurihappo; Aminohippursyra; Aminohipúrico, ácido; Kwas aminohipurowy; PAHA; Para-aminohippuric Acid. *N*-4-Aminobenzoylaminoacetic acid.

$C_9H_{10}N_2O_3$ = 194.2.

CAS — 61-78-9 (aminohippuric acid); 94-16-6 (sodium aminohippurate).

ATC — V04CH30.

ATC Vet — QV04CH30.



Pharmacopoeias. In *US.*

USP 31 (Aminohippuric Acid). A white crystalline powder which discolours on exposure to light. Soluble 1 in 45 of water, 1 in 50 of alcohol, and 1 in 5 of 3N hydrochloric acid; very slightly soluble in carbon tetrachloride, in chloroform, in ether, and in benzene; freely soluble in alkaline solutions with some decomposition, and in diluted hydrochloric acid. Store in airtight containers. Protect from light.

Adverse Effects

Sodium aminohippurate may cause nausea and vomiting, hypersensitivity reactions, vasomotor disturbances, flushing, tingling, cramps, and a feeling of warmth. Patients may develop an urge to urinate or defaecate after infusion.

Interactions

The estimation of sodium aminohippurate may be affected in patients taking procaine, sulfonamides, or thiazosulfone. Probenecid diminishes the excretion of aminohippuric acid. Clearance is also affected by penicillins, salicylates, and other drugs that compete for the same excretory pathways.

Uses and Administration

Aminohippuric acid is excreted mainly by proximal tubular secretion, with some glomerular filtration. It is given by intravenous infusion, as sodium aminohippurate (aminohippurate sodium; $C_9H_9N_2NaO_3$ = 216.2), for the estimation of effective renal plasma flow. Doses are aimed at producing a plasma concentration of 20 micrograms/mL; at these concentrations about 90% of aminohippurate is cleared from the renal bloodstream in a single circuit in patients with normal renal function. Sodium aminohippurate has also been used for the assessment of the renal tubular secretory mechanism. Doses for this purpose are infused slowly to achieve a plasma concentration of 400 to 600 micrograms/mL to saturate the tubular secretion. These tests are used mainly in research procedures.

Preparations

USP 31: Aminohippurate Sodium Injection.

Ammi Visnaga Fruit

Biznaga, fruto de la; Khella; Khellah; Picktooth Fruit; Visnaga.

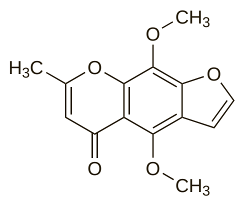
Khellin *(rINN)*

Kelina; Khelline; Khellinum; Visammin. 4,9-Dimethoxy-7-methyl-5*H*-furo[3,2-*g*]chromen-5-one.

Келлин

$C_{14}H_{12}O_5$ = 260.2.

CAS — 82-02-0.



Visnadine *(BAN, rINN)*

Visnadina; Visnadinum. 10-Acetoxy-9,10-dihydro-8,8-dimethyl-2-oxo-2*H*,8*H*-pyrano[2,3-*f*]chromen-9-yl 2-methylbutyrate.

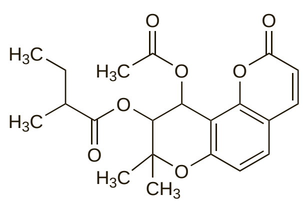
Виснадин

$C_{21}H_{24}O_7$ = 388.4.

CAS — 477-32-7.

ATC — C04AX24.

ATC Vet — QC04AX24.



Profile

Ammi visnaga fruit is used in herbal preparations.

Khellin and visnadine are vasodilators obtained from *Ammi visnaga* fruit or by synthesis. Khellin also has a bronchodilatory action and has been used in angina pectoris and asthma. Khellin has also been tried in conjunction with UV light to treat vitiligo (see Pigmentation Disorders, p.1582). Visnadine has been used in coronary, cerebral, and peripheral vascular disorders.

Homoeopathy. Ammi visnaga has been used in homoeopathic medicines under the following names: Ammi vis.

◊ References.

1. Hofer A, *et al.* Long-term results in the treatment of vitiligo with oral khellin plus UVA. *Eur J Dermatol* 2001 **11:** 225–9.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Khellangan N†.

Multi-ingredient: ***Austria:*** Urelium Neu; ***Ger.:*** Cefadrin; Oxacant-Khella N†; Stenocrat†; ***Pol.:*** Kelicardina; Nefrol.

Ammonia

Amoníaco, solución diluida de; Amonowy wodorotlenek; Amonyak.

CAS — 7664-41-7.

NH_3

NOTE. The food additive number E527 is used for ammonium hydroxide. Solutions of ammonia in water have been referred to as ammonium hydroxide solutions. Strong solutions of ammonia have also been described by the synonyms Ammoniaca, Ammoniacum, Ammoniaque Officinale, and Liquor Ammoniae Fortis. Dilute solutions of ammonia have also been referred to as Ammonia Water, Ammonium Hydricum Solutum, Liquor Ammoniae, and Liquor Ammoniae Dilutus.

Pharmacopoeias. Strong ammonia solutions are included in *Chin.* (25 to 28%), *Eur.* (see p.vii) (25 to 30%), and *USNF* (27 to 31%). Dilute ammonia solutions are included in *Br.*, *Chin.*, *Ger.*, *Jpn*, and *Swiss* (all about 10%).

Ph. Eur. 6.2 (Ammonia Solution, Concentrated; Ammoniae Solutio Concentrata; Strong Ammonia Solution BP 2008). It contains between 25% and 30% (w/w) of ammonia, NH_3. A clear colourless liquid. Very caustic. Miscible with water and with alcohol. Store at a temperature not exceeding 20° in airtight containers.

BP 2008 (Dilute Ammonia Solution). It is prepared by diluting Strong Ammonia Solution with freshly boiled and cooled purified water. It contains 9.5 to 10.5% w/w of NH_3.

NOTE. The BP directs that when Ammonia Solution is prescribed or demanded, Dilute Ammonia Solution shall be dispensed or supplied.

USNF 26 (Strong Ammonia Solution). It contains between 27% and 31% (w/w) of NH_3. On exposure to air, it loses ammonia rapidly. A clear colourless liquid with an exceedingly pungent characteristic odour. Store at a temperature not exceeding 25° in airtight containers.

Handling. Strong ammonia solutions should be handled with great care because of the caustic nature of the solutions and the irritating properties of the vapour. Cool the container well before opening and avoid inhalation of the vapour.

Adverse Effects

Ingestion of strong solutions of ammonia causes severe pain in the mouth, throat, and gastrointestinal tract, as well as severe local oedema and salivation, with cough, vomiting, and shock. Burns to the oesophagus and stomach may result in perforation. Stricture formation, usually in the oesophagus, can occur weeks or months later. Ingestion may also cause oedema of the respiratory tract and pneumonitis, though this may not develop for a few hours.

Inhalation of ammonia vapour causes sneezing and coughing and in high concentration causes pulmonary oedema. Asphyxia has been reported after oedema or spasm of the glottis. Ammonia vapour is irritant to the eyes and causes weeping; there may be conjunctival swelling and temporary blindness.

Ammonia solution in contact with skin and eyes produces blistering and vesiculation; ammonia burns feel 'soapy' because of saponification of the tissues. Strong solutions on the conjunctiva cause a severe reaction with conjunctival oedema, corneal damage, and acute glaucoma. Late complications include angle-closure glaucoma, opaque corneal scars, atrophy of the iris, and formation of cataracts. Ammonia burns have resulted from treating insect bites and stings with the strong solution, and even with the dilute solution, especially if a dressing is subsequently applied.

Toxicity from mixing cleaning agents. For reference to the adverse effects of mixing ammonia-based and hypochlorite-based cleaning agents see Sodium Hypochlorite, p.1661.

Treatment of Adverse Effects

Ingestion of ammonia solutions should not be treated by lavage or emesis. Milk or water have been given as diluents, but small volumes should be used to reduce the risk of inducing emesis. Appropriate measures should be taken to alleviate pain, shock, and pulmonary oedema, and maintain an airway.

Contaminated skin and eyes should be flooded immediately with water and the washing continued for at least 15 minutes. Any affected clothing should be removed while flooding is being carried out.

Uses and Administration

Dilute solutions of ammonia have been used as reflex stimulants either as smelling salts or oral solutions. They have also been used as rubefacients and counter-irritants (see p.5) and to neutralise insect stings. Users should always be aware of the irritant properties of ammonia.

Hartshorn and Oil was sometimes used as a name for an ammonia liniment. Household ammonia and cloudy ammonia have been used as names for cleaning preparations of ammonia with oleic acid or soap respectively. A saturated solution containing about 35% w/w and known as '0.880 ammonia' has been used in many chemical and industrial applications.

Stings. Bathers who were stung by Portuguese men-of-war (*Physalia physalis*) were rapidly and effectively relieved of discomfort, paresis, irritation, and other symptoms by the application of aromatic ammonia spirit compresses.[1]

Pharmacopoeias. In *USNF.*

USNF 26 (Ammonium Phosphate). Colourless or white granules or powder. Freely soluble in water; practically insoluble in alcohol and in acetone. A 1% solution in water has a pH of 7.6 to 8.2. Store in airtight containers.

Profile

Ammonium phosphate was formerly used as a diuretic. It may be used as a buffering agent in pharmaceutical preparations.

Ammonium biphosphate (monobasic ammonium phosphate; $NH_4H_2PO_4$ = 115.0) has been used to acidify urine and as a phosphate supplement.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Fr.:*** Phosphore Medifa; ***Pol.:*** Phosphor.

Amnion

Amnios.

Profile

Human extra-embryonic fetal membranes comprise an inner amniotic membrane, the amnion, and an outer membrane, the chorion. Amnion is used in ocular surgery for a range of conditions. Both amnion and combined membranes have been used as a dressing for raw wounds including chronic ulcers and burns.

Amylase

Amilasa; Amylaza; Diastase; Glucogenase; Ptyalin.

CAS — 9000-92-4 (amylase); 9000-85-5 (bacterial α-amylase); 9000-90-2 (porcine α-amylase, pancreatic); 9001-19-8 (taka-diastase);.

ATC — A09AA01.

ATC Vet — QA09AA01.

Pharmacopoeias. In *Fr.* and *Jpn.*

Adverse Effects

Hypersensitivity reactions have been reported.

Hypersensitivity. References to asthma developing after occupational exposure to amylases used in the flour milling[1-3] and detergent[4,5] manufacturing industries, and studies[6-8] to assess the likelihood of developing amylase hypersensitivity after ingesting wheat products including bread.

Uses and Administration

The term amylase refers to an enzyme catalysing the hydrolysis of α-1,4-glucosidic linkages of polysaccharides such as starch, glycogen, or their degradation products. Amylases may be classified according to the manner in which the glucosidic bond is attacked. Endoamylases attack the α-1,4-glucosidic linkage at random. Alpha-amylases are the only types of endoamylases known and yield dextrins, oligosaccharides, and monosaccharides. The more common alpha-amylases include those isolated from human saliva, mammalian pancreas, *Bacillus subtilis*, *Aspergillus oryzae*, and barley malt. Exoamylases attack the α-1,4-glucosidic linkage only from the non-reducing outer polysaccharide chain ends. They include beta-amylases and glucoamylases (amyloglucosidases or gamma-amylases) and are of vegetable or microbial origin. Beta-amylases yield beta-limit dextrins and maltose, and glucoamylases yield glucose.

Amylase is used in the production of predigested starchy foods and for the conversion of starch to fermentable sugars in the baking, brewing, and fermentation industries.

Amylase from various sources has been used as an ingredient of preparations of mixed digestive enzymes, and has been given by mouth for its supposed activity in reducing respiratory-tract inflammation and local swelling and oedema. Pancreatic enzymes such as pancreatin (p.2360) and pancrelipase (p.2360) have amylase activity.

Anagrelide Hydrochloride *(BANM, USAN, rINNM)*

Anagrélide, Chlorhydrate d'; Anagrelidi Hydrochloridum; BL-4162a; BMY-26538-01; Hidrocloruro de anagrelida. 6,7-Dichloro-1,5-dihydroimidazo[2,1-*b*]quinazolin-2(3*H*)-one hydrochloride.

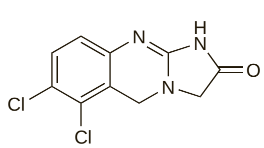
Анагрелида Гидрохлорид

$C_{10}H_7Cl_2N_3O,HCl = 292.5.$

CAS — 68475-42-3 (anagrelide); 58579-51-4 (anagrelide hydrochloride).

ATC — L01XX35.

ATC Vet — QL01XX35.



(anagrelide)

Adverse Effects

Adverse effects most commonly reported with anagrelide include headache, palpitations and tachycardia, fluid retention, diarrhoea, nausea, and abdominal pain; fatigue, dizziness, flatulence, vomiting, dyspnoea, skin rash, and anaemia have also occurred. Cardiovascular effects also include vasodilatation and positive inotropic effects; myocardial infarction, cardiomyopathy and heart failure have been reported. Anagrelide has been shown to be embryotoxic and fetotoxic in *animal* studies.

Effects on the heart. High-output heart failure occurred in a patient given anagrelide for essential thrombocytosis.[1] Clinical and haemodynamic adverse effects resolved almost immediately on stopping anagrelide.

1. Engel PJ, *et al.* High-output heart failure associated with anagrelide therapy for essential thrombocytosis. *Ann Intern Med* 2005; **143:** 311–13.

Effects on the lungs. Severe life-threatening hypersensitivity pneumonitis has been associated with anagrelide.[1]

1. Raghavan M, *et al.* Severe hypersensitivity pneumonitis associated with anagrelide. *Ann Pharmacother* 2003; **37:** 1228–31.

Erectile dysfunction. Erectile dysfunction associated with anagrelide therapy has been reported in a patient.[1]

1. Braester A, Laver B. Anagrelide-induced erectile dysfunction. *Ann Pharmacother* 2002; **36:** 1291.

Precautions

Anagrelide is mainly removed from the body by hepatic metabolism, and its use is contra-indicated in patients with severe hepatic impairment. In the UK it is additionally contra-indicated in those with moderate impairment, but in the USA its use is permitted in such patients at reduced doses (see below). Licensed drug information in the UK also contra-indicates its use in those with moderate to severe renal impairment (creatinine clearance less than 50 mL/minute).

Anagrelide should be used with caution in patients with cardiovascular disease. Cardiac function should be assessed in patients before and during treatment, and patients monitored for cardiovascular adverse effects during treatment. For precautions in patients taking anagrelide with aspirin, see Interactions, below.

Platelet counts should be monitored closely, especially at the start of treatment (see Uses and Administration, below). Haemoglobin, white blood cells, and hepatic and renal function should also be monitored until a maintenance dose is established.

Dizziness may affect the performance of skilled tasks such as driving.

Anagrelide should not be used during pregnancy.

Interactions

There is the theoretical possibility that inhibitors of the cytochrome P450 isoenzyme CYP1A2, including grapefruit juice, could reduce the clearance of anagrelide. Anagrelide itself demonstrates limited inhibitory activity towards CYP1A2. Anagrelide may exacerbate the effects of other phosphodiesterase inhibitors such as amrinone, cilostazol, enoximone, milrinone, and olprinone that also produce positive inotropic effects.

Potentiation of the effects of other drugs that modify platelet function when given with anagrelide is a theoretical possibility; although no clinically significant effects have been seen when given with aspirin, the UK manufacturer suggests that the risk-benefit potential should be assessed before using both drugs in patients with a platelet count above 1 500 000 cells/mm^3 and/or a history of haemorrhage.

Pharmacokinetics

Anagrelide is well absorbed from the gastrointestinal tract with peak plasma concentrations occurring about 1 hour after an oral dose on an empty stomach, increasing to 3 hours in the presence of food, although this appears to have no clinically significant effect on bioavailability. It is extensively metabolised, primarily by the cytochrome P450 isoenzyme CYP1A2, and eliminated in the urine; less than 1% of a dose is excreted unchanged. The plasma half-life is about 1.3 hours.

Uses and Administration

Anagrelide is an inhibitor of cyclic AMP phosphodiesterase III that reduces platelet production and, at higher than therapeutic doses, inhibits platelet aggregation. It is used to treat primary (essential) thrombocythaemia (p.654) in patients intolerant of, or unresponsive to, other therapy, and also in thrombocythaemia secondary to other myeloproliferative disorders.

Anagrelide is given orally as the hydrochloride monohydrate ($C_{10}H_7Cl_2N_3O,HCl,H_2O = 310.6$) but doses are expressed in terms of the base; 1.2 mg of anagrelide hydrochloride monohydrate is equivalent to about 1 mg of anagrelide. The initial dose is the equivalent of anagrelide 1 mg daily in 2 divided doses. After at least a week, the dose is adjusted, by increasing the daily dose by not more than 500 micrograms in any one week, until the platelet count is maintained within the normal range. The usual maintenance dose is 1 to 3 mg daily. The dose should not exceed 10 mg daily or 2.5 mg as a single dose. In the USA, a higher initial dose of 2 mg daily, divided into 2 or 4 doses, is used; an initial daily dose of 500 micrograms is recommended in children. For doses to be used in patients with hepatic impairment, see below.

The effects of anagrelide therapy must be regularly monitored: platelet counts should be measured every 2 days during the first week of treatment and then at least weekly until the maintenance dose is reached.

Administration in hepatic impairment. UK licensed drug information recommends that anagrelide should not be given to patients with moderate or severe hepatic impairment. In the USA, anagrelide therapy is not recommended in patients with severe hepatic impairment, although patients with moderate hepatic impairment have been given anagrelide in an initial daily dose of 500 micrograms, which should be maintained for a minimum of 1 week and with cardiovascular monitoring; the daily dose may then be increased cautiously as above.

Anecortave *(rINN)*

AL-3789; Anecortava; Anécortave; Anecortave Acetate *(USAN)*; Anecortavum. 17,21-Dihydroxypregna-4,9(11)-diene-3,20-dione 21-acetate.

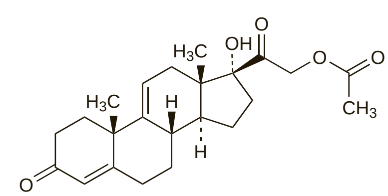
Анекортав

$C_{23}H_{30}O_5 = 386.5.$

CAS — 7753-60-8.

ATC — S01LA02.

ATC Vet — QS01LA02.



Profile

Anecortave is an angiostatic cortisene under investigation for the treatment of patients with neovascular (wet) age-related macular degeneration (p.785). It is similar in structure to cortisol acetate but without any glucocorticoid activity and is able to inhibit several steps of the neovascularisation process. It is given by posterior juxtascleral depot injection and is available in some countries for compassionate use on a named-patient basis.

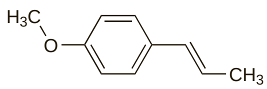
Anethole

Anethol; Anetol; *p*-Propenylanisole. (*E*)-1-Methoxy-4-(prop-1-enyl)benzene.

$C_{10}H_{12}O$ = 148.2.

CAS — 104-46-1; 4180-23-8 (E isomer).



NOTE. Distinguish from Anethole Trithione (below).

Pharmacopoeias. In *Ger.* Also in *USNF.*

USNF 26 (Anethole). Obtained from anise oil or other sources or prepared synthetically. At or above 23° anethole is a colourless or faintly yellow liquid with a sweet taste and the aromatic odour of aniseed. Very slightly soluble in water; soluble 1 in 2 by volume of alcohol; readily miscible with chloroform and with ether. Store in airtight containers. Protect from light.

Profile

Anethole has similar properties to those of anise oil (below). It is also included in mixed terpene preparations used in urinary-tract disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Angelica

Andělikový kořen; Angélica; Angelicae radix; Angelikarot; Angélique, racine d'; Angyalgyökér; Archangelica; Archangelicae Radix; Korzeń arcydzięgla; Šventagaršvių šaknys; Väinönputkenjuuri.

CAS — 8015-64-3 (angelica oils).

Pharmacopoeias. In *Eur.* (see p.vii).

Jpn has separate monographs for *Angelica acutiloba* (Japanese Angelica) and *A. dahurica*.

Chin. specifies *A. dahurica*, *A. dahurica* var. *formosana*, *A. pubescens*, and *A. sinensis*.

Ph. Eur. 6.2 (Angelica Root). The whole or cut, carefully dried rhizome and root of *Angelica archangelica* (*Archangelica officinalis*) containing a minimum of 0.2% v/w of essential oil, calculated with reference to the dried drug.

Profile

Angelica (*Angelica archangelica*) is widely used in herbal medicine. The root is used as a bitter to stimulate the appetite. Angelica also has diaphoretic and expectorant properties and has been used for circulatory and respiratory disorders.

Angelica oil is used in aromatherapy.

Angelica contains furanocoumarins and may cause photosensitivity reactions or interfere with anticoagulant therapy.

Other *Angelica* spp. that are used in herbal medicine include *A. acutiloba* (Japanese angelica), *A. dahurica*, *A. pubescens*, and *A. sinensis* (see Dong Quai, p.2258).

Angelica stems are candied for culinary use.

Homoeopathy. Angelica has been used in homoeopathic medicines under the following names: Archangelica; Angelica archangelica; Angelica archangelica var. archangelica.

Preparations

Proprietary Preparations (details are given in Part 3)

Aniseed

Anice; Anis; Anis, fruit d'; Anís, semilla de; Anis Verde; Anis Vert; Anise; Anise Fruit; Anisi fructus; Ánizstermés (fruit); Anyžių vaisiai (fruit); Anýzový plod (fruit); Owoc anyżu (fruit).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Aniseed; Anisi Fructus). The whole dried fruit of *Pimpinella anisum*, containing not less than 2% v/w of essential oil. It has an odour reminiscent of anethole. Protect from light.

Profile

Aniseed is carminative and mildly expectorant; it is used mainly as anise oil or as preparations of the oil. It may cause contact dermatitis, probably due to its anethole content.

Aniseed is the source of anise oil (below).

Anise Oil

Anís, aceite esencial de; Anis, huile essentielle d'; Aniseed Oil; Anisi aetheroleum; Anisi Etheroleum; Anisolja; Anisöljy; Ánizsolaj; Anyžių eterinis aliejus; Anýzová silice; Esencia de Anís; Essence d'Anis; Olejek anyżowy; Oleum Anisi.

NOTE. The name anise oil is also applied to Star Anise Oil, p.2392.

Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Anise Oil; Anisi Aetheroleum). An essential oil obtained by steam distillation from the dry ripe fruits of *Pimpinella anisum*. It contains less than 1.5% linalol, 0.5 to 5.0% estragole, less than 1.2% α-terpineol, 0.1 to 0.4% *cis*-anethole, 87 to 94% *trans*-anethole, 0.1 to 1.4% anisaldehyde, and 0.3 to 2.0% pseudoisoeugenyl 2-methylbutyrate. A clear, colourless or pale yellow liquid. Relative density 0.980 to 0.990. F.p. 15° to 19°. Store in well-filled, airtight containers at a temperature not exceeding 25°. Protect from light.

USNF 26 (Anise Oil). The volatile oil distilled with steam from the dried, ripe fruit of *Pimpinella anisum* (Apiaceae) or from the dried ripe fruit of *Illicium verum* (Illiaceae). Congealing temperature not lower than 15°. Soluble 1 in 3 of alcohol (90%). Store in well-filled airtight containers. If solid material has separated, carefully warm the oil until it is completely liquefied, and mix before using.

Incompatibility. PVC bottles softened and distorted fairly rapidly in the presence of anise oil, which should not be stored or dispensed in such bottles.[1]

1. Department of Pharmaceutical Sciences of the Pharmaceutical Society of Great Britain. Plastics medicine bottles of rigid PVC. *Pharm J* 1973; **210:** 100.

Profile

Anise oil is carminative and mildly expectorant and is a common ingredient of cough preparations. It is also a flavour. Anise oil is used in aromatherapy.

It may cause contact dermatitis, probably due to its anethole content.

◊ For references to aniseed and anise oil, see Aniseed, above.

Preparations

BP 2008: Camphorated Opium Tincture; Compound Orange Spirit; Concentrated Anise Water; Concentrated Camphorated Opium Tincture;
USNF 26: Compound Orange Spirit.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Cough Relief†; Digestive Aid; Gartech; ***Austria:*** Bradosol; Bronchostop; Expectal-Tropfen; Heumann's Bronchialtee; Kamillosan; Luuf-Hustentee; Neo-Angin; Nesthakchen; ***Braz.:*** Ovariuse-dan†; ***Canad.:*** Beech Nut Cough Drops†; ***Cz.:*** Biotussil; Bronchosan; Bronchostop†; Neo-Angin; Stopangin; ***Fr.:*** Paregorique; ***Ger.:*** Aspasmon N†; Bronchoforton; Em-eukal Husten- und Brusttee†; Em-medical†; Ephepect-Pastillen N; Floradix Multipretten N; Heumann Bronchialtee Solubifix T; Hevertopect N†; Kamillosan Mundspray; Leber-Galle-Tropfen 83†; Neo-Ballistol†; Pulmocordio mite SL†; Pulmotin; ratioGast†; Repha-Os; Salmiak†; Salviathymol N; Sinuforton; ***Hong Kong:*** Ephepect Blocker; ***India:*** Bestozyme; Kamillosan-N; Neopeptine; ***Indon.:*** Minyak Telon Cap Tiga Anak; OBH; Silex; ***Neth.:*** Bronchicum; ***Philipp.:*** Kamillosan M; ***Pol.:*** Carmolis; Herbolen D; Tobacoff; ***Rus.:*** Carmolis (Кармолис)†; Carmolis Fluid (Кармолис Жидкость)†; Stopangin (Стопангин); ***S.Afr.:*** Borsdruppels; Paragoriese-Elikser; Puma Cough Balsam; ***Spain:*** Carminativo Ibys†; Carminativo Juventus; H Tussan; Odontocromil c Sulfamida†; ***Switz.:*** Bronchofluid N†; Carmol; Carmol Plus†; Gem; Kamillosan; Makaphyt Gouttes antitussives; Neo-Bronchol; Odontal; Pastilles bronchiques S nouvelle formule; Pastilles pectorales Demo N; Penta; ***Thai.:*** Gas-Nep; Mesto-Of; ***UK:*** Hactos; Honey & Molasses; Lightning Cough Remedy; Potters Strong Bronchial Catarrh Pastilles; Potters Sugar Free Cough Pastilles; Slippery Elm Stomach Tablets; Vegetable Cough Remover; Zubes; Zubes Blackcurrant.

Anisodamine

6-Hydroxy-hyoscyamine.

$C_{17}H_{23}NO_4$ = 305.4.

CAS — 55869-99-3.

Pharmacopoeias. *Chin.* has a monograph for Raceanisodamine and Anisodamine Hydrobromide.

Profile

Anisodamine is an alkaloid isolated from *Scopolia tangutica* (*Anisodus tanguticus*), a plant used as a traditional medicine in China. It is related to atropine and hyoscyamine and has similar antimuscarinic properties (p.1221). Anisodamine is given orally for its spasmolytic actions in the treatment of gastrointestinal spasm. It has also been tried in circulatory disorders, septic shock, and organophosphorus poisoning.

◊ References.

Apis mellifera

Abeille domestique; Abeja de la Miel; The honey bee.

Медоносная Пчела Домашняя

Pharmacopoeias. *Eur.* (see p.vii) includes the live worker honey bee for homoeopathic preparations.

Ph. Eur. 6.2 (Honey Bee for Homoeopathic Preparations; Apis Mellifera ad Praeparationes Homoeopathicas). Live worker honey bee, *Apis mellifera*.

Profile

The honey bee is a source of purified honey (p.1948), royal jelly (p.2382), propolis (p.2373), and bee pollen (see Pollen and Pollen Extracts, p.2370).

Homoeopathy. Preparations of *Apis mellifera* have been used in homoeopathic medicines under the following names: Apis; Apis mellifica; Apis mel; Apis mell.

Arthritis. Bee venom has traditionally been used in the treatment of arthritis.[1,2] Studies *in vitro* have shown that bee venom has anti-inflammatory activity similar to that of cyclophosphamide. Melittin appears to be the active constituent, and seems to act by interfering with superoxide radical production from human leucocytes.[1]

Hypersensitivity. For reference to the use of whole body extracts or venom from Hymenoptera spp. for allergen immunotherapy in allergic subjects, see p.2251. For reference to hypersensitivity reactions to bee products see under Royal Jelly, p.2382.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***S.Afr.:*** Bolus Eucalypti Comp; ***Switz.:*** Forapin†.

Apricot

Pharmacopoeias. *Chin.* includes Bitter Apricot Seed, the kernel obtained from various species of *Prunus*. *Jpn* includes a monograph for Apricot Kernel.

Profile

The kernels of the apricot, *Prunus armeniaca* (*Armeniaca vulgaris*; *P. tiliifolia*) (Rosaceae), are used in Chinese medicine for disorders of the respiratory tract and for constipation.

Apricot is a source of persic oil (p.2365). Amygdalin, the major cyanogenic glycoside of apricot kernels, is the major constituent of laetrile (p.2330). Apricot kernels are also a source of pangamic acid (p.2362).

Apricot fruits are used as a food.

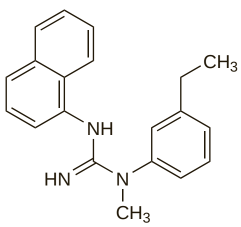
Aptiganel *(pINN)*

Aptiganelum. 1-(*m*-Ethylphenyl)-1-methyl-3-(1-naphthyl)guanidine.

Аптиганел

$C_{20}H_{21}N_3$ = 303.4.

CAS — 137159-92-3.



Aptiganel Hydrochloride *(USAN)*

CNS-1102.

$C_{20}H_{21}N_3$,HCl = 339.9.

CAS — 137160-11-3.

Profile

Aptiganel is a guanidine derivative that antagonises the effects of the excitatory amino-acid neurotransmitter glutamate at NMDA-receptors. It has been investigated for the prevention of ischaemic brain damage in patients with traumatic head injury or stroke.

◊ Following dose-ranging studies of aptiganel in healthy subjects[1] and in patients,[2] adverse effects reported[3] in patients with acute ischaemic stroke, at doses that had been neuroprotective in *animals*, included an increase in systolic blood pressure and an excess of CNS effects. A randomised controlled study[4] in patients with acute ischaemic stroke was suspended because of a lack of efficacy and a potential imbalance in mortality compared with placebo.

Arachis Oil

Arachide, huile d', raffinée; Arachidis Oleum; Arachidis oleum raffinatum; Cacahuete, aceite de; Earth-nut Oil; Erdnussöl; Finomított földimogyoróolaj; Ground-nut Oil; Huile d'Arachide; Jordnötolja, raffinerad; Maapähkinäöljy, puhdistettu; Nut Oil; Ol. Arach.; Olej arachidowy oczyszczony; Óleo de Amendoim; Oleum Arachis; Peanut Oil; Podzemnicový olej čištěný; Refined Arachis Oil; Yerfıstığı Yağı; Žemės riešutų aliejus.

Pharmacopoeias. In *Eur.* (see p.vii), *Int.*, and *Jpn.* Also in *USNF*.

Eur. also includes hydrogenated arachis oil.

Ph. Eur. 6.2 (Arachis Oil, Refined; Arachis Oil BP 2008). The refined fatty oil obtained from the shelled seeds of *Arachis hypogaea*. A suitable antoxidant may be added. It is a clear, yellowish viscous liquid consisting of glycerides, chiefly of oleic and linoleic acids, with smaller amounts of other acids. It solidifies at about 2°. Very slightly soluble in alcohol; miscible with petroleum spirit. Store in well-filled containers. Protect from light.

The BP 2008 gives Ground-nut Oil and Peanut Oil as approved synonyms.

Ph. Eur. 6.2 (Arachis Oil, Hydrogenated; Arachidis Oleum Hydrogenatum). Arachis oil that has been refined, bleached, hydrogenated, and deodorised. It is a white or faintly yellowish soft mass that melts to a clear pale yellow liquid when heated. Practically insoluble in water; very slightly soluble in alcohol; freely soluble in dichloromethane and in petroleum spirit (b.p. 65° to 70°). Protect from light.

USNF 26 (Peanut Oil). The fully-refined (alkali-refined, bleached, and deodorised at 230° to 260°) oil obtained from the seed kernels of one or more of the cultivated varieties of *Arachis hypogaea* (Leguminosae). It is a colourless or pale yellow, oily liquid with a bland taste; it may have a characteristic nutty odour. Very slightly soluble in alcohol; miscible with carbon disulfide, with chloroform, and with ether. Store at a temperature not exceeding 40° in airtight containers. Protect from light.

Profile

Emulsions containing arachis oil are used in nutrition. Arachis oil is given as an enema for softening impacted faeces. It is used in drops for softening ear wax (see under Docusates, p.1725) and in emollient creams. Arachis oil is given by mouth, usually with sorbitol, as a gallbladder evacuant prior to cholecystography.

Precautions. It has been suggested that the use during infancy of preparations containing arachis oil, including infant formulae and topical preparations, may be responsible for sensitisation to peanut, with a subsequent risk of hypersensitivity reactions.[1-3] The arachis oil used in such preparations is refined oil and it has been pointed out that such oil should not contain the proteins that produce allergic reactions in susceptible people.[4,5] In the USA, heating of arachis oil during preparation, to further reduce protein content, has been proposed.[6] Nonetheless, some consider that sufficient protein may be present in refined oil to cause sensitisation.[7] However, others have pointed out that to date, there are no reliable data about doses of topical arachis oil needed to induce sensitisation via the epidermal route and that the benefit of protecting skin barrier functions in atopic patients with products using refined arachis oil outweigh possible risks of sensitisation.[8] In the UK, the CSM considered that there was not enough evidence to conclude that medicinal products containing arachis oil could lead to sensitisation.[9] However, although they considered the risk of a reaction to be low, they recommended that patients known to be allergic to peanuts should not use medicines containing arachis oil (nor, because of the possibility of cross-sensitivity, should patients allergic to soya), and that such medicines should include an appropriate warning in the labelling.

Areca

Areca Nuts; Arecae Semen; Arekasame; Betel; Betel Nuts; Noix d'Arec.

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of areca:

Daka; Gua; Maag; Mak; Marg; Pan parag; Pinang; Pugua; Puwak; Supai; Suparim.

Pharmacopoeias. In *Chin.* and *Jpn.*

Profile

Areca consists of the dried ripe seeds of *Areca catechu* (Palmae) containing the alkaloid arecoline.

Areca is used in Asian countries as a masticatory. It has sialogogue properties and is chewed for its mild intoxicant and euphoriant effects. The usual custom is to chew pieces of areca seed (areca nut; betel nut) wrapped with lime (calcium hydroxide) in the leaf of the betel pepper (betelvine) (*Piper betle*, which is unrelated to areca). This preparation is known as 'betel quid' (betel) or 'paan' (pan-masala), and produces a red juice when chewed, which stains the saliva, teeth and mucosa. Other ingredients that might be added include catechu gum, spices, or tobacco.

Arecoline and arecaidine (produced by the hydrolysis of arecoline when chewed with lime) have cholinergic activity, and adverse effects that may occur with initial or heavy use of areca include excessive salivation, sweating, lachrymation, urinary incontinence, or diarrhoea. An increased incidence of oral submucosal fibrosis, oral leucoplakia, and oral squamous cell carcinoma has been reported following habitual use.

Areca was formerly used in the treatment of tapeworm infection, and arecoline has been used in veterinary medicine as a purgative and taenifuge.

◊ Discussions of the health risks associated with the chewing of preparations containing areca nut by indigenous populations in Asia[1-3] and immigrant groups in the UK,[4] USA,[5] and New Zealand,[6] including acute effects.[2,3,5] See also Adverse Effects of Tobacco Products under Nicotine (p.2352) for reference to mixtures of areca and tobacco.

6. Yoganathan P. Betel chewing creeps into the New World. *N Z Dent J* 2002; **98:** 40–5.

Carcinogenicity. Precancerous and cancerous conditions of the oral cavity have been attributed to the chewing of preparations containing areca (see above). In betel-chewer's mucosa, the oral mucosa is discoloured and there is desquamation or peeling of the oral epithelium from the traumatic effect of chewing and possibly a chemical action of the constituents. This condition may be a precursor of oral submucosal fibrosis, which is considered to be precancerous.[1] Oral leucoplakia is another precancerous condition that is reported. The role of areca in the development of these conditions and oral squamous cell carcinoma has been debated. The effects may be due to the arecaidine content of areca, the alkalinity of the lime, presence of tobacco, or a combination of these.[2,3] Results from a case-controlled study[4] point to an independent association between oral squamous cell carcinoma and chewing areca seeds in preparations without tobacco compared with non-users of areca. A review[5] of available evidence strongly supports this association.

Effects on the lungs. Evidence suggesting that there is an association between betel-nut chewing and bronchoconstriction in asthmatic patients.[1,2]

1. Taylor RFH, *et al*. Betel-nut chewing and asthma. *Lancet* 1992; **339:** 1134–6.
2. Kiyingi KS. Betel nut chewing and asthma. *Lancet* 1992; **340:** 59–60.

Effects on the nervous system. Areca-nut (betel-nut) chewing is associated with habituation, addiction, and dependence,[1] and CNS symptoms of withdrawal have been described in 2 patients.[2] A case of neonatal withdrawal syndrome in an infant born to a chronic areca-nut user has also been reported.[3] Psychosis has also been reported.[1]

It has been suggested that the muscarinic action of areca alkaloids may have a beneficial effect on symptoms of schizophrenia, and a study of such patients in a Micronesian population provides some support for this idea.[4] However, severe extrapyramidal symptoms followed betel-nut chewing in 2 patients with chronic schizophrenia who were also receiving antipsychotic therapy.[5]

Aristolochia

Serpentaria.

NOTE. *Aristolochia clematitis* has also been known as asarabacca (p.2261).

Pharmacopoeias. *Chin.* allows various species of *Aristolochia*.

Profile

Aristolochia spp. (birthworts) including *A. clematitis* and *A. ringens (A. brasiliensis)* have been used in herbal medicine.

Serpentary (serpentaria) is the dried rhizome and roots of *Aristolochia serpentaria* (Virginian snakeroot) and of *A. reticulata* (Texan snakeroot) (Aristolochiaceae). Snakeroot is also used as a common name to describe poisonous *Eupatorium* spp. Preparations of serpentary have been used as bitters. The active ingredient is aristolochic acid, which has been tried in a number of inflammatory disorders, mainly in folk medicine; the sodium salt of aristolochic acid has also been used. However, there is concern over such use since aristolochic acid has been reported to be carcinogenic and nephrotoxic.

Chinese medicine has employed various species of *Aristolochia* including *A. contorta*, *A. debilis* (but see under Adverse Effects, below), and *A. manshuriensis*. The terms Mu Tong and Fangji have been used for *Aristolochia* spp. in traditional medicine.

Adverse effects. Progressive interstitial fibrosis of the kidney related to a slimming regimen containing Chinese herbs had been reported in 70 patients in Belgium by 1993; 30 of these patients had terminal renal failure.[1] Renal failure has also been reported[2] in 2 patients in the UK after ingestion of Chinese herbal medicines that were later found to contain aristolochic acid, a known nephrotoxin;[3] one of these patients subsequently developed invasive urothelial carcinoma.[4] Inadvertent ingestion of aristolochic acid can originate as a result of the substitution of *Aristolochia* spp. (probably *A. manshuriensis*) for other innocuous herbal substances;[2,5] the Belgian cases were probably as a result of substitution of *A. fangchi* extracts for *Stephania tetrandra*.[1] As a result of these cases, the UK MCA issued a permanent ban on *Aristolochia* preparations in 1999. Similar bans have been made in several other countries;[3] in 2004, the Chinese regulatory authority also banned the use of *A. fangchi* and *A. debilis* in traditional medicine formulations. Examination of 39 patients in Belgium with nephropathy associated with *A. fangchi* ingestion had revealed 18 cases of urothelial carcinoma and evidence of mild to moderate dysplasia in 19 patients.[6] There had appeared to be a higher risk of carcinoma with total doses of *A. fangchi* in excess of 200 g.

Aristolochic acid has been proposed as the cause of endemic (Balkan) nephropathy,[7] which is confined to a very specific rural geographical distribution and first described in the 1950s. Data supporting this hypothesis included findings of DNA damage linked to aristolochic acid in kidney samples from affected patients, as well as renal failure in horses who had grazed in the local fields. *Aristolochia clematitis* is endemic to the region and has been found in fields cultivated for wheat grain. It is possible that the local population could be exposed to toxic amounts of aristolochic acid over time from bread made with grain contaminated with *A. clematitis* seeds.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Euserpina Cellulite.

Multi-ingredient: *S.Afr.:* Borstol Cough Remedy.

Arnica

Árnica; Arnica, fleur d' (arnica flower); Arnicae Anthodium; Arnicae flos (arnica flower); Arnikablomma (arnica flower); Arnikinkukka (arnica flower); Arnikový květ (arnica flower); Arnikų žiedai (arnica flower); Hegyi árnika virág (arnica flower); Koszyczek arniki (arnica flower); Leopard's Bane; Mountain Tobacco; Wolf's Bane; Wolfsbane.

NOTE. Wolfsbane is also used as a common name for aconite (p.2246).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Arnica Flower; Arnica Flos). It consists of the whole or partially broken, dried flowerheads of *Arnica montana*. It contains not less than 0.4% w/w of total sesquiterpene lactones expressed as dihydrohelenalin tiglate, calculated with reference to the dried drug. It has an aromatic odour. Protect from light.

Profile

Arnica is generally used in the form of the flowerheads of *Arnica montana* (Compositae).

Arnica flower is irritant to mucous membranes and when ingested has produced severe symptoms including gastrointestinal and nervous system disturbances, both tachycardia and bradycardia, and collapse. Tincture of arnica may cause dermatitis when applied to the skin of sensitive persons.

Preparations of arnica flower and arnica root are used as astringents for topical application to unbroken skin in conditions such as sprains and bruises; such preparations are not considered suitable for internal use. Arnica flowers are the source of arnica oil, which has been used similarly.

Herbal preparations containing arnica are available for oral use.

Homoeopathy. Arnica has been used in homoeopathic medicines under the following names: Arnica montana; Arnica, Flos; Arnica montana e flore; Arnica montana ex herba; Arnica, Planta tota; Arnica montana ex planta tota; Arn. mont. Some homoeopathic preparations are available for oral use.

Arsenic Trioxide *(USAN)*

Acidum Arsenicosum Anhydricum; Arseni Trioxydum; Arsenic; Arsenic Oxide; Arsénico, trióxido de; Arsenicum Album; Arsénieux, anhydride; Arsenii trioxidum; Arsenious Acid; Arsenous Oxide; White Arsenic. Diarsenic trioxide.

As_2O_3 = 197.8.
CAS — 1327-53-3 (arsenic trioxide); 7784-45-4 (arsenic triiodide).
ATC — L01XX27.
ATC Vet — QL01XX27.

Pharmacopoeias. In *Jpn.*
Eur. (see p.vii) includes a form for homoeopathic preparations.

Ph. Eur. 6.2 (Arsenious Trioxide for Homoeopathic Preparations; Arsenii Trioxidum ad Praeparationes Homoeopathicae). A white or almost white powder. Practically insoluble to sparingly soluble in water; it dissolves in solutions of alkali hydroxides and carbonates.

Adverse Effects

The toxicity of arsenic compounds varies according to chemical composition, solubility, and valency. Inorganic arsenic compounds are much more toxic than organic compounds and elemental arsenic is the least toxic. Toxicity increases with increasing solubility, and trivalent (arsenite) compounds are more toxic than pentavalent (arsenate) compounds. Arsenic exerts its effects through a variety of pathophysiological mechanisms such as induction of oxidative stress and binding to sulphydryl groups in enzymes, and it has the potential to affect most of the major organ systems in the body; it also induces alteration in gene expression.

Acute poisoning. Estimates of lethal and toxic oral doses vary: the lethal dose of arsenic trioxide has been reported to be around 100 to 300 mg; a dose of 1 mg/kg of arsenic may be lethal in children; acute toxic doses of arsenic compounds have been reported to range from 1 mg to 10 g. Symptoms of acute poisoning occur within 30 minutes to several hours after ingestion and food delays the onset.

Early features of acute arsenic poisoning following ingestion involve the gastrointestinal tract with common symptoms of a metallic or garlic taste, a burning sensation in the mouth, dysphagia, abdominal pain, severe nausea, projectile vomiting, haemorrhagic gastritis, and profuse 'rice-water' diarrhoea leading to hypovolaemic shock; the breath may have an odour of garlic. In the absence of adequate treatment, death can occur within 24 hours of a severely toxic dose. Absorption of arsenic may produce multisystem toxicity days or weeks later, which could include cardiomyopathy, anaemia, leucopenia, skin disorders, acute respiratory distress syndrome, hepatitis, renal failure, encephalopathy, and peripheral polyneuropathy.

Arsenic compounds are irritant and corrosive when inhaled or in contact with the skin or eyes; acute systemic effects may occur after inhalation or skin contact.

Chronic poisoning. Arsenic is widely distributed in the environment: the smelting industry (non-ferrous metals) is a major industrial source of arsenic contamination in the soil, water, and air; mining residues and arsenical pesticides and wood preservatives also contribute to soil and water contamination. Seafood is a source of organic arsenic. Occupational exposure is a potential cause of chronic arsenic toxicity but in the general population, food and drinking water is usually the source of arsenic.

Chronic arsenic poisoning or occupational exposure typically produces varied skin disorders appearing over 1 to 10 years, particularly hyperkeratosis, especially affecting the palms and soles, and changes in skin pigmentation. Transverse white lines (Mee's lines) may appear in the nails several weeks after absorption. Gastrointestinal disturbances may occur, although are less likely with chronic exposure. Hypertension, cardiovascular disorders, and diabetes mellitus have been associated with chronic arsenic poisoning. Jaundice may occur as a result of hepatomegaly and portal hypertension may eventually develop. Encephalopathy and peripheral neuropathies may also occur. Arsenic is toxic to the bone marrow and produces a wide range of blood disorders including leucopenia and aplastic anaemia. Chronic exposure to arsenic has been associated with neoplasms of the skin, lungs, bladder, liver, and kidney. Chronic inhalation of arsenic salts may result in perforation of the nasal septum.

Adverse effects of therapeutic use. Reported adverse effects of arsenic trioxide therapy in patients with acute promyelocytic leukaemia (APL) include leucocytosis, neutropenia, raised liver enzyme values, gastrointestinal disturbances, fatigue, oedema, hyperglycaemia, hypokalaemia, dyspnoea, cough, skin rashes, pruritus, pyrexia, headaches, paraesthesia, and dizziness. Prolongation of the QT interval and other cardiac arrhythmias have occurred. The so-called 'leukocyte activation syndrome' ('APL differentiation syndrome') similar to one that develops with tretinoin therapy (see Retinoic Acid Syndrome, p.1618) has occurred in some patients. Sudden death has been reported in a few patients.

Treatment of Adverse Effects

Acute poisoning due to the ingestion of arsenic compounds should be treated by immediate gastric lavage if the patient presents within 1 hour and has not already vomited. Activated charcoal has been used to reduce absorption but is unlikely to be of benefit unless a significant amount of arsenic has been ingested. Intravenous replacement of fluids and electrolytes should be undertaken as necessary to correct dehydration and electrolyte imbalance; pressor agents may be required.

Chelation therapy should start immediately the cause of arsenic poisoning is suspected. The therapy of choice for acute poisoning is unithiol (p.1468) given intravenously in cases of gastrointestinal toxicity. Dimercaprol (p.1444) given intramuscularly is the second choice therapy if unithiol is unavailable. Oral therapy with unithiol or succimer (p.1466) should be substituted when gastrointestinal disturbances are no longer a problem. Oral penicillamine (p.1456) has also been used, including in conjunction with dimercaprol in severely ill patients, but its use in arsenic poisoning has been superseded by unithiol and succimer.

Patients suffering from chronic arsenic poisoning should be removed from the source of contamination as soon as possible. Initiation of oral chelation therapy with unithiol or succimer will depend on the patient's clinical condition and laboratory results of arsenic in urine, hair, and nails.

Chelation therapy should be continued until arsenic concentrations in urine have fallen to acceptable levels, although the therapeutic end-points of chelation therapy are poorly defined.

If renal failure occurs haemodialysis may be required.

Poisoning. The treatment of 3 patients who had ingested massive doses of arsenic has been described.[1,2] An adult survived after ingesting 54 g of arsenic trioxide:[1] in addition to standard supportive measures, attempts to remove the arsenic from his gastrointestinal tract included lavage, endoscopic removal, manual removal after gastrotomy, and cleansing enemas, plus chelation therapy. Of 2 siblings who ingested solubilised inorganic arsenic in a pesticide solution,[2] one child (aged 4 months) was estimated to have ingested 428 mg/kg arsenic and died despite aggressive attempts at removal of the arsenic, including chelation therapy, extracorporeal membrane oxygenation, exchange transfusion, and haemodialysis. The other child, aged 2 years, was estimated to have ingested 14.6 mg/kg arsenic, and survived following standard chelation therapy.

Precautions

Patients receiving arsenic trioxide for acute promyelocytic leukaemia should have their ECG, blood sugar, electrolytes, blood count, and coagulation monitored at least twice weekly during induction and at least weekly during consolidation. More frequent monitoring may be needed in clinically unstable patients. Arsenic trioxide should be used with caution in renal impairment since renal excretion is the main route of elimination.

Pharmacokinetics

Water-soluble arsenic acids and their salts are more rapidly absorbed from the gastrointestinal tract than poorly soluble arsenicals such as arsenic trioxide. The absorption of arsenic trioxide is dependent upon the physical form of the compound and coarsely powdered material may be eliminated in the faeces before significant dissolution and absorption can occur. Soluble arsenic salts may also be absorbed following inhalation and through skin.

Once absorbed, arsenic is stored mainly in the liver, kidneys, heart, and lungs, with smaller amounts in the muscles and nervous tissue. About 2 weeks after ingestion, arsenic is deposited in the hair and nails and remains fixed to the keratin for years. It is also deposited in the bones and skin.

Although pentavalent arsenic is reduced to some degree *in vivo* to the more toxic trivalent form, trivalent arsenic is slowly and extensively oxidised to pentavalent arsenic. Both forms are methylated and excreted in the urine, mainly as dimethylarsinic acid, with smaller amounts appearing as monomethylarsonic acid and inorganic arsenic compounds. Although about 60% of a dose may be eliminated in the urine within 8 days, small amounts may continue to be excreted for several weeks after a single dose. Less significant amounts of arsenic are excreted in the faeces and sweat and via the lungs and skin. It is also distributed into breast milk and readily crosses the placenta.

Uses and Administration

Arsenic trioxide is used for induction of remission and consolidation in acute promyelocytic leukaemia (see below). It is given as an intravenous infusion over 1 to 2 hours to patients who are refractory to, or who have relapsed from, conventional therapy with retinoids and antineoplastics; if acute vasomotor reactions occur, the rate of infusion may be slowed and up to 4 hours may be taken. For induction, a dose of 150 micrograms/kg is given once daily until remission occurs; no more than 50 doses should be given (in the USA, the maximum number of induction doses allowed is 60). Treatment for consolidation must begin 3 to 4 weeks after completion of induction (or 3 to 6 weeks in the USA). The dose for consolidation is 150 micrograms/kg once daily given for 25 doses spread over a period of up to 5 weeks; the regimen suggested in the UK is to give the daily dose for 5 days each week followed by 2 days without dosing.

Arsenic trioxide is used in certain Asian herbal remedies. Arsenic anhydride has also been used.

Arsenic trioxide has been widely used as a constituent of weedkillers and sheepdips and as a rodenticide.

Arsenic trioxide and arsenic triiodide were formerly used internally as solutions or externally as ointments in the treatment of various skin diseases, but such use is generally no longer recommended. Externally, arsenic trioxide has a caustic action.

Homoeopathy. Arsenic trioxide has been used in homoeopathic medicines under the following names: Arsenious trioxide; Arsenici trioxidum; Arsenicum album; Acidum arsenicosum; Ars. alb.

Acute myeloid leukaemias. The use of arsenic trioxide in the management of patients with acute promyelocytic leukaemia (p.652) has been reviewed.[1-4] Remission was achieved in patients who had relapsed despite conventional therapy with retinoids and antineoplastics.[5,6] Arsenic trioxide is also being investigated for postremission therapy and in conjunction with transplantation.[4] Treatment was also successful in newly-diagnosed patients but severe liver toxicity occurred in some cases.[5]

Arsine

Arsenic Trihydride; Arsina; Hydrogen Arsenide.

AsH_3 = 77.95.

CAS — 7784-42-1.

Profile

Arsine is a heavy colourless gas with a garlic-like odour, which has no clinical uses but is an environmental or occupational hazard. It is highly toxic and causes severe haemolysis which may result in acute renal failure. It is potentially toxic below the odour threshold of 0.5 ppm and dangerously toxic after exposure to as little as 3 ppm; there may be a latent period of up to 24 hours following exposure before symptoms develop. Symptoms of arsine gas poisoning include generalised weakness, muscle cramps, thirst, headache, abdominal pain, nausea, vomiting, anorexia, jaundice, bronze skin coloration, haemolytic anaemia, haematuria, oliguria, and anuria. Pulmonary oedema, ECG abnormalities, and neurological disorders have also been reported. Treatment involves exchange transfusions and haemodialysis; dimercaprol and other chelating agents have been used but are of no value in the acute stage and do not prevent haemolysis.

Asafetida

Asafétida; Asafoetida; Asant; Devil's Dung; Gum Asafetida.

Pharmacopoeias. In *Chin.*

Profile

Asafetida is an oleo-gum resin obtained from various species of *Ferula* (Umbelliferae). It has been used as a carminative and antispasmodic. It was also formerly used as an expectorant. It is used in cooking and is an ingredient of certain foods.

Asarabacca

Ásaro europeo; Hazelwort; Rhizoma Asari; Wild Nard.

NOTE. Asarabacca has also been used as a common name for *Aristolochia clematitis* (see Aristolochia, p.2260).

Profile

Asarabacca is the dried rhizome, roots, and leaves of *Asarum europaeum* (Aristolochiaceae), which is an ingredient of snuffs. It is also an irritant emetic and has been used in rodent poisons. Asarabacca is an ingredient of preparations given for respiratory disorders.

Homoeopathy. Asarabacca has been used in homoeopathic medicines under the following names: Asarum; Asarum europaeum; Asar. eur.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Escarol†.

Asbestos

Amianto; Asbesto.

Profile

The name asbestos is applied to several naturally occurring and widely distributed fibrous mineral silicates of the serpentine and amphibole groups. They include amosite (brown asbestos), anthophyllite, chrysotile (white asbestos), and crocidolite (blue asbestos).

Asbestos has properties of heat resistance, insulation, and reinforcement and has been used extensively for heat or electrical insulation, fire protection, in friction materials, and in the construction industry in a wide variety of materials including cement, pipes, and tiles.

When inhaled, asbestos fibres can cause asbestosis (pulmonary fibrosis), lung cancer, and mesothelioma of the pleura and peritoneum. Mesothelioma has been reported in persons exposed to relatively small amounts of asbestos after an average latent period of 30 to 40 years. An association between occupational exposure and an increased incidence of gastrointestinal, laryngeal, and other cancers has also been reported. Some types of asbestos are more hazardous than others; crocidolite (a member of the amphibole group) is considered to be the most dangerous.

Ash

Askblad (ash leaf); Chinese Ash (*Fraxinus chinensis*); Common Ash; Esche; European Ash (*Fraxinus excelsior*); Fraxini folium (ash leaf); Frêne; Frêne, feuille de (ash leaf); Fresno; Jasanový list (ash leaf); Magas kőrisfa levél (ash leaf); Saarnenlehti (ash leaf); Uosių lapai (ash leaf).

Pharmacopoeias. *Chin.* includes Ash Bark (Cortex Fraxini, Qinpi). *Eur.* (see p.vii) includes Ash Leaf.

Ph. Eur. 6.2 (Ash Leaf; Fraxini Folium). The dried leaf of *Fraxinus excelsior* or *F. oxyphylla*. It contains a minimum of 2.5% of total hydroxycinnamic acid derivatives, expressed as chlorogenic acid ($C_{16}H_{18}O_9$ = 354.3), calculated with reference to the dried drug. Protect from light.

Profile

The leaf of the European ash (*Fraxinus excelsior*) is included in herbal remedies for the treatment of rheumatic and joint disorders, urinary-tract disorders, and constipation. The leaf of *F. oxyphylla* is also used.

Ash bark has been used to reduce fever and as a tonic.

The bark of the Chinese ash, *F. chinensis* or related species is used in traditional Chinese medicine for disorders including acute dysentery and diarrhoea.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Phytodolor; ***Austria:*** Phytodolor; ***Cz.:*** Phytodolor; ***Fr.:*** Mediflor Tisane Antirhumatismale No 2; Mediflor Tisane Contre la Constipation Passagere No 7; Mediflor Tisane No 4 Diuretique; Obeflorine; ***Ger.:*** Phytodolor; ***Spain:*** Natusor Artilane†.

Avena

Aven; Cultivated White Oats; Oatmeal; Oats.

Pharmacopoeias. *US* includes colloidal oatmeal.

USP 31 (Colloidal Oatmeal). The powder resulting from the grinding and further processing of whole oat grain. When dried at 120° for 4 hours it loses not more than 10% of its weight.

Profile

Avena is the grain of *Avena sativa* (Gramineae). It is used in herbal medicine and is reputed to have sedative activity.

A colloidal fraction extracted from avena is used in the preparation of emollient dermatological preparations.

Whether avenin, a protein present in oats, is harmful to patients with coeliac disease is controversial.

Homoeopathy. Avena has been used in homoeopathic medicines under the following names: Avena sativa; Avena e planta tota; Aven. sat.

Preparations

Avocado

Aguacate; Ahuacate; Alligator Pear.

Авокадо; Аллигаторова Груша

Profile

Avocado, *Persea americana* (*P. persea*; *P. gratissima*) (Lauraceae), is included in herbal preparations mainly for respiratory-tract and hepatic disorders. Several parts of the plant, including the fruit and leaves, have been used for a variety of disorders.

The fruit is a dietary source of vitamin E, vitamin B_6, vitamin K, and iron.

Avocado oil is used topically as an emollient and as a neutral carrier for essential oils in aromatherapy. It may also be taken orally.

Preparations

Proprietary Preparations (details are given in Part 3)

Arg.: Piascledine.

Multi-ingredient: ***Arg.:*** Derrumal; ***Braz.:*** Abacateirol†; Lisian†; ***Chile:*** Codetol PM; Jarabe Palto Compuesto con Miel Adulto; Jarabe Palto Compuesto con Miel Infantil; Paltomiel; Paltomiel Plus; Pulmosina; ***NZ:*** Mr Nits; ***Port.:*** Biureol.

Azadirachta

Margosa; Neem; Nim.

Profile

Azadirachta is the dried stem bark, root bark, and leaves of *Azadirachta indica* (*Melia azadirachta*) (Meliaceae), which has been used as a bitter. It is widely used in South Asia and has been reported to have insecticidal, antimalarial, and spermicidal properties. Azadirachta oil (neem oil, margosa oil) expressed from the seeds has also been used.

Adverse Effects. *EFFECTS ON THE SKIN.* Report of a patient who developed contact dermatitis of the face and ears 1 week after she started using neem oil for the treatment of alopecia areata.[1]

1. Reutemann P, Ehrlich A. Neem oil: an herbal therapy for alopecia causes dermatitis. *Dermatitis* 2008; **19:** E12–E15.

POISONING. Severe poisoning in Indian children given neem oil as a remedy for minor ailments.[1]

1. Sinniah D, Baskaran G. Margosa oil poisoning as a cause of Reye's syndrome. *Lancet* 1981; **i:** 487–9.

Uses. *INSECT REPELLENT.* References.

Azapentacene Sulfonate Sodium

Disodium 5,12-dihydroquinoxalino[2,3-*b*]phenazine disulfonate.

$C_{18}H_{12}N_4O_6S_2,Na_2$ = 490.4.

CAS — 1790-56-3 (azapentacene disulfonic acid); 3863-80-7 (azapentacene disulfonate disodium).

Profile

Azapentacene sulfonate sodium has been used in the management of cataracts.

Preparations

Proprietary Preparations (details are given in Part 3)

Hong Kong: Quinax; ***Indon.:*** Pentacin; ***Mex.:*** Lutrax; ***Philipp.:*** Quinax; ***Pol.:*** Quinax; ***Rus.:*** Quinax (Квинакс); ***Singapore:*** Quinax; ***Thai.:*** Quinax.

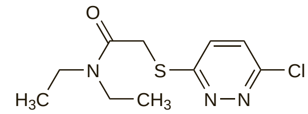
Azintamide *(rINN)*

Azintamida; Azintamidum; Azinthiamide; ST-9067. 2-[(6-Chloro-3-pyridazinyl)thio]-*N*,*N*-diethylacetamide.

Азинтамид

$C_{10}H_{14}ClN_3OS$ = 259.8.

CAS — 1830-32-6.



Profile

Azintamide has been used as a choleretic.

Preparations

Proprietary Preparations (details are given in Part 3)

Austria: Ora-Gallin purum; ***Port.:*** Colerin.

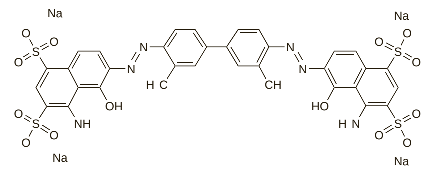
Multi-ingredient: ***Arg.:*** Biluen Enzimatico; ***Austria:*** Ora-Gallin; Ora-Gallin compositum; ***Port.:*** Colerin-F; ***Spain:*** Oragalin Espasmolitico.

Azovan Blue *(BAN)*

Azovanum Caeruleum; Azul de Evans; CI Direct Blue 53; Colour Index No. 23860; Evans Blue; T-1824. Tetrasodium 1,1′-diamino-8,8′-dihydroxy-7,7′-(2,2′-dimethylbiphenyl-4,4′-diylbisdiazo)di-(naphthalene-2,4-disulphonate); Tetrasodium 6,6′-[3,3′-dimethylbiphenyl-4,4′-diylbis(azo)]bis[4-amino-5-hydroxynaphthalene-1,3-disulphonate].

$C_{34}H_{24}N_6Na_4O_{14}S_4$ = 960.8.

CAS — 314-13-6.



Profile

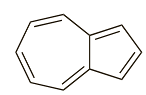
Azovan blue is a dye that has been given intravenously for the determination of blood volume; it is firmly bound to plasma proteins and is slow to leave the circulation. Some patients may experience staining of the skin.

Azulene

Atsuleeni; Azulen; Azuleno; Azulenum; Cyclopentacycloheptene.

$C_{10}H_8$ = 128.2.

CAS — 275-51-4.



NOTE. The name 'Azulene' has also been used for a number of derivatives of azulene including azulene sodium sulfonate, chamazulene, guaiazulene, and sodium gualenate.

Profile

Azulene has been used in preparations for anorectal and skin disorders, and for oral hygiene. The sodium sulfonate salt has been used in preparations for mouth and throat disorders and for dyspepsia; sodium gualenate has also been used in gastrointestinal disorders.

Hypersensitivity. Allergic cheilitis occurred in a patient after long-term use of a toothpaste containing azulene.[1]

1. Balato N, *et al.* Allergic cheilitis to azulene. *Contact Dermatitis* 1985; **13:** 39–40.

Bactericidal Permeability Increasing Protein

Proteína bactericida incrementadora de la permeabilidad.

Opebacan *(BAN, USAN, rINN)*

Opébacan; Opebacán; Opebacanum; rBPI-21. 132-L-Alanine-1-193-bactericidal/permeability-increasing protein (human).

Опебакан

CAS — 206254-79-7.

Profile

Bactericidal permeability increasing protein is produced by human leucocytes and possesses both Gram-negative bactericidal and endotoxin-neutralising properties. It also inhibits angiogenesis. Several derivatives have been developed and are under investigation. Opebacan is a modified recombinant fragment of bactericidal permeability increasing protein that is under investigation for the treatment of Crohn's disease and meningococcal septicaemia. Other derivatives of bactericidal permeability increasing protein are under investigation for retinopathies and acne.

Bactericidal permeability increasing protein also possesses antifungal activity.

Barium

Bario; Baryum.

Ba = 137.327.

CAS — 7440-39-3.

Description. Barium is a soft, highly reactive, silvery-white metal.

Adverse Effects and Treatment

All barium salts that are water- or acid-soluble are very toxic. The symptoms of barium poisoning arise from stimulation of all forms of muscle and include vomiting, excess salivation, colic, diarrhoea, slow or irregular pulse, hypertension, dysarthria, confusion, dizziness, paraesthesias, vertigo, muscle tremors, seizures, muscular paralysis, and respiratory or metabolic acidosis. Hypokalaemia is common. Renal impairment due to barium poisoning has been reported. Death from cardiac or respiratory failure may occur.

In acute poisoning, emptying the stomach by lavage is recommended if possible. Magnesium or sodium sulfate may be given to convert barium to insoluble barium sulfate. Hypokalaemia and metabolic acidosis should be corrected and ventilation assisted if necessary. Excretion may be increased by diuresis. Haemodialysis may be used in severe poisoning.

Uses and Administration

The soluble barium salts are not used in therapeutics but are widely used in industry. For the uses of barium chloride and barium hydroxide lime, see below. Barium sulfide has been used as a depilatory and barium carbonate was used as a rodenticide. The insoluble barium sulfate (p.1477) is used as a contrast medium.

Barium Chloride

Barii chloridum; Bario chloridas; Bariumklorid; Bariumkloridi; Baru chlorek; Baryum, chlorure de.

Бария Хлорид

Ba Cl_2 = 208.2.

CAS — 10361-37-2 (anhydrous barium chloride); 10326-27-9 (barium chloride dihydrate).

Pharmacopoeias. *Eur.* (see p.vii) includes a form for homoeopathic preparations.

Ph. Eur. 6.2 (Barium Chloride Dihydrate for Homoeopathic Preparations; Barii Chloridum Dihydricum ad Praeparationes Homoeopathicas). A white or almost white, crystalline powder or colourless crystals. Freely soluble in water; very slightly soluble or practically insoluble in alcohol.

Profile

Barium chloride has several industrial uses including the manufacture of pigments and dyes, leather tanning, boiler detergents, water softeners, and aluminium refining.

Barium chloride is a soluble salt and therefore potentially toxic if ingested. Systemic toxicity arising from burns to skin from molten barium chloride has been reported. For the adverse effects and treatment of barium and barium salts, and reference to barium chloride poisoning, see under Barium, above.

Homoeopathy. Barium chloride has been used in homoeopathic medicines under the following names: Barium chloratum; Baryta muriatica; Bar. mur.

Barium Hydroxide Lime

Bario, cal con hidróxido de.

CAS — 17194-00-2 (anhydrous barium hydroxide); 12230-71-6 (barium hydroxide octahydrate).

Pharmacopoeias. In *US.*

USP 31 (Barium Hydroxide Lime). A mixture of barium hydroxide octahydrate and calcium hydroxide; it may also contain potassium hydroxide. White or greyish-white granules, or coloured with an indicator to show when absorptive power is exhausted. It absorbs not less than 19% of its weight of carbon dioxide. Store in airtight containers.

Profile

Barium hydroxide lime is used similarly to soda lime to absorb carbon dioxide in closed-circuit anaesthetic apparatus. Barium hydroxide lime contains a soluble form of barium and is toxic if swallowed. For the adverse effects and treatment of barium poisoning, see above.

Precautions. Excessive drying out of barium hydroxide lime in anaesthetic apparatus, which may occur if oxygen flow through the equipment is left on for prolonged periods, can lead to the production of carbon monoxide and the risk of inducing carboxyhaemoglobinaemia in patients undergoing anaesthesia using the apparatus.[1]

1. Committee on Safety of Medicines/Medicines Control Agency. Safety issues in anaesthesia: volatile anesthetic agents and carboxyhaemoglobinaemia. *Current Problems* 1997; **23:** 7. Also available at: http://www.mhra.gov.uk/home/idcplg?IdcService=GET_FILE&dDocName=CON2023230&RevisionSelectionMethod=LatestReleased (accessed 14/07/06)

Basil

Albahaca; Basil Herb; Basilic; Basilici Herba; Basilienkraut; Sweet Basil.

Pharmacopoeias. In *Fr.*

Profile

The aerial parts of basil, *Ocimum basilicum* (Lamiaceae), are used in preparations for gastrointestinal disorders and as a diuretic. It is also used as a culinary herb.

Basil oil is an essential oil with antiseptic properties. It is used in perfumery and cosmetics and also in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ger.:*** Gastrol S†; Weleda-Rheumasalbe M; ***Ital.:*** Citrosystem; ***Rus.:*** Bronchitussin (Бронхитусен); Bronchocin (Бронхоцин).

Bay Oil

Laurel dulce, aceite esencial de; Myrcia Oil; Oleum Myrciae.

NOTE. Distinguish from Laurel Leaf Oil (Bay Leaf Oil) which is obtained from the leaves of *Laurus nobilis* (Lauraceae).

Profile

Bay oil is a yellow volatile oil that darkens rapidly on exposure to air and has a pleasant odour and spicy taste. It is obtained by distillation from the leaves of *Pimenta racemosa* (Myrtaceae) and probably other allied species. The principal use of bay oil is in the preparation of bay rum, which is used as a hair lotion and as an astringent application. Bay oils from both *P. racemosa* and *Laurus nobilis* are used in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** Adiantine; Medicated Extract of Rosemary.

Bayberry

Árbol de la cera; Bayberry Bark; Candle Berry Bark; Myrica; Wax Myrtle Bark.

NOTE. Bayberry has also been used as a synonym for bog myrtle (see p.2267).

Profile

Bayberry, the root bark of *Myrica cerifera* (Myricaceae), is used in upper respiratory-tract disorders and as a gargle for sore throat. It has also been used in gastrointestinal disorders, to treat vaginal discharge, and topically on ulcers and sores.

Homoeopathy. Bayberry has been used in homoeopathic medicines under the following names: Myrica cerifera; Myri. cer.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** EP&C Essence; Peerless Composition Essence.

Bearberry

Bärentraubenblätter; Bearberry Leaves; Busserole; Busserole, feuille de; Gayuba; Liść mą; Medvědicový list; Medveszőlőlevél; Meškauogių lapai; Mjölonrisblad; Ptarmiganberry Leaves; Sianpuolukanlehti; Uvae ursi folium; Uva-Ursi.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.*

Ph. Eur. 6.2 (Bearberry Leaf). The whole or cut dried leaves of the bearberry, *Arctostaphylos uva-ursi*. It contains not less than 7.0% of anhydrous arbutin, calculated with reference to the dried drug. Protect from light.

Profile

Bearberry has been reported to be a diuretic, bacteriostatic, and astringent and has been used in the treatment of urinary-tract disorders.

Homoeopathy. Bearberry has been used in homoeopathic medicines under the following names: Uva ursi; Uva ur.

Preparations

Proprietary Preparations (details are given in Part 3)

Braz.: Uromed; ***Cz.:*** List Medvedice Lecive†; Medvedice†; ***Ger.:*** Cystinol Akut; Uvalysat; ***Mex.:*** Uvavid†; ***Pol.:*** Uversan.

Multi-ingredient: ***Arg.:*** Ajolip; KLB6 Fruit Diet; Water Pill c Potasio†; ***Austral.:*** Althaea Complex; Bioglan Cranbiotic Super; Cranberry Complex; De Witts New Pills; Extralife Fluid-Care; Extralife PMS-Care; Extralife Uri-Care; Fluid Loss†; Herbal Diuretic Formula†; Medinat PMT-Eze†; Profluid†; Protemp†; Urinase†; Uva-Ursi Complex†; Uva-Ursi Plus†; ***Austria:*** Uropurat; ***Braz.:*** Composto Anticelulitico†; Emagrevit†; Lisian†; Pilulas De Witt's†; ***Canad.:*** Herbal Diuretic; ***Chile:*** Primacy Phyto +†; ***Cz.:*** Blasen- und Nierentee†; Species Urologicae Planta; Urcyston Planta; Urologicka Cajova Smes; ***Fr.:*** Mediflor Tisane Antirhumatismale No 2; Mediflor Tisane No 4 Diuretique; Uromil; Urophytum†; ***Ger.:*** Arctuvan; Harntee STADA; Presselin Nieren-Blasen K 3†; Prostatin F†; ***Israel:*** Jungborn; ***Mex.:*** Noxivid; ***NZ:*** De Witts Pills†; ***Pol.:*** Nefrosept; Urofort; ***Port.:*** Asic†; Rilastil Dermo Solar; ***Rus.:*** Herbion Urological Drops (Гербион Урологические Капли); ***Spain:*** Genurat; Urisor†; ***Switz.:*** Demonatur Dragees pour les reins et la vessie; Dragees S pour les reins et la vessie; Strath Gouttes pour les reins et la vessie; Tisane pour les reins et la vessie; Urinex; ***UK:*** Antitis; Aqua Ban Herbal; Backache; Backache Relief; Cascade; De Witt's K & B Pills; Diuretabs; HealthAid Boldo-Plus; HRI Water Balance; Kas-Bah; Modern Herbals Water Retention; Prementaid; Sciargo; Tabritis; Uvacin; Watershed.

Belladonna

Belladon; Belladona; Belladone; Belladone, feuille de (belladonna leaf); Belladonnablad (belladonna leaf); Belladonnae folium (belladonna leaf); Belladonnanlehti (belladonna leaf); Deadly Nightshade; Liść pokrzyku (belladonna leaf); Nadragulyalevél (belladonna leaf); Rulíkový list (belladonna leaf); Šunvyšnių lapai (belladonna leaf); Tollkirschen.

ATC — A03BA04.

ATC Vet — QA03BA04.

Pharmacopoeias. *Eur.* (see p.vii) and *US* include a monograph for Belladonna Leaf. *Chin.* includes Belladonna Herb.

Eur. also includes Prepared Belladonna Leaf, Standardised Belladonna Leaf Tincture, and Standardised Belladonna Leaf Dry Extract.

Jpn includes only Belladonna Root.

Ph. Eur. 6.2 (Belladonna Leaf; Belladonnae Folium). It consists of the dried leaf, or dried leaf and flowering, and occasionally fruit-bearing, tops of *Atropa belladonna*. It contains not less than 0.30% of total alkaloids, calculated as hyoscyamine. The alkaloids consist mainly of hyoscyamine together with smaller amounts of hyoscine. It has a slightly nauseous odour. Protect from light.

The BP 2008 directs that when Belladonna Herb, Belladonna Leaf, or Powdered Belladonna Herb is prescribed, Prepared Belladonna Herb shall be dispensed.

Ph. Eur. 6.2 (Belladonna, Prepared; Belladonnae Pulvis Normatus; Prepared Belladonna Herb BP 2008). It is belladonna leaf powder adjusted to an alkaloidal content of 0.28 to 0.32% of total alkaloids, calculated as hyoscyamine. Store in airtight containers. Protect from light.

USP 31 (Belladonna Leaf). It consists of the dried leaf and flowering or fruiting top of *Atropa belladonna* (Solanaceae). It yields not less than 0.35% of the alkaloids of belladonna leaf. When moistened, its odour is slight, somewhat tobacco-like. Avoid long exposure to direct sunlight. Protect powdered Belladonna Leaf from light.

Stability in mixtures. Atropine in belladonna preparations was unstable at alkaline pH and would quickly be degraded in mixtures with a pH above 7.[1] Such mixtures in the BPC 1973 included Aluminium Hydroxide and Belladonna Mixture, Cascara and Belladonna Mixture, and Magnesium Trisilicate and Belladonna Mixture.

1. *PSGB Lab Report P/71/9* 1971.

Adverse Effects, Treatment, and Precautions

As for Atropine Sulfate, p.1219.

Interactions

As for antimuscarinics in general (see Atropine Sulfate, p.1220).

Uses and Administration

Belladonna has the actions of atropine (p.1219). Belladonna herb and its preparations have been used for their antimuscarinic actions in a wide range of conditions, including the relief of gastrointestinal and urinary-tract disorders associated with smooth muscle spasm, but they are generally regarded as an outmoded form of treatment.

Belladonna liniments and plasters have been used as counter-irritants for the relief of pain but there is little evidence that they have a beneficial effect and adverse effects have occurred.

Homoeopathy. Belladonna has been used in homoeopathic medicines under the following names: Atropa bella-donna; Bell.

Preparations

Ph. Eur.: Belladonna Leaf Dry Extract, Standardised; Belladonna Leaf Tincture, Standardised;
USP 31: Belladonna Extract; Belladonna Extract Tablets; Belladonna Tincture.

Proprietary Preparations (details are given in Part 3)

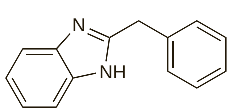
Bendazol Hydrochloride *(rINNM)*

Bendazol, Chlorhydrate de; Bendazoli Hydrochloridum; Dibazol; Hidrocloruro de bendazol. 2-Benzylbenzimidazole hydrochloride.

Бендазола Гидрохлорид

$C_{14}H_{12}N_2$,HCl = 244.7.

CAS — 621-72-7 (bendazol); 1212-48-2 (bendazol hydrochloride).



(bendazol)

Profile

Bendazol hydrochloride is used as an antispasmodic.

Bentiromide *(BAN, USAN, rINN)*

Bentiromid; Bentiromida; Bentiromidi; Bentiromidum; BTPABA; BT-PABA; E-2663; PFT; Ro-11-7891. 4-(N-Benzoyl-L-tyrosylamino)benzoic acid.

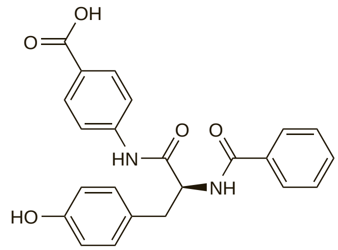
Бентиромид

$C_{23}H_{20}N_2O_5$ = 404.4.

CAS — 37106-97-1.

ATC — V04CK03.

ATC Vet — QV04CK03.



Profile

Bentiromide has been given orally as a noninvasive test of exocrine pancreatic function, the amount of *p*-aminobenzoic acid and its metabolites excreted in the urine being taken as a measure of the chymotrypsin-secreting activity of the pancreas. Headache and gastrointestinal disturbances have been reported in patients receiving bentiromide. The bentiromide test has given misleading results in patients with gastrointestinal, liver, or kidney disorders, or in patients receiving certain foods or drugs that are excreted as arylamines. Some of these drugs included benzocaine, chloramphenicol, lidocaine, paracetamol, procaine, procainamide, sulfonamides, and some diuretics.

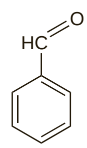
Benzaldehyde

Benzaldehído; Benzaldehyd.

C_7H_6O = 106.1.

CAS — 100-52-7.



Pharmacopoeias. In *Br.* Also in *USNF.*

BP 2008 (Benzaldehyde). A clear colourless liquid with a characteristic odour of bitter almonds. Slightly soluble in water; miscible with alcohol and with ether. Store at a temperature not exceeding 15° in well-filled containers. Protect from light.

USNF 26 (Benzaldehyde). A colourless strongly refractive liquid with an odour resembling that of bitter almond oil and a burning aromatic taste. Slightly soluble in water; miscible with alcohol, with ether, and with fixed and volatile oils. Store in well-filled, airtight containers. Protect from light.

Profile

Benzaldehyde is used as a flavour as an alternative to volatile bitter almond oil. It may cause contact dermatitis.

Preparations

USNF 26: Compound Benzaldehyde Elixir.

Benzyl Cinnamate

Benzylu cynamonian; Cinnamein. Phenylmethyl 3-phenyl-2-propenoate.

$C_{16}H_{14}O_2$ = 238.3.

CAS — 103-41-3.

Profile

Benzyl cinnamate is a constituent of various balsams and resins, including Peru balsam (p.2365), to which it has been used similarly. It is also used as a flavour and in perfumery.

Preparations

Proprietary Preparations (details are given in Part 3)

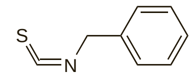
Multi-ingredient: ***Belg.:*** Pulmex; Pulmex Baby; ***Braz.:*** Ozonyl; ***UK:*** Sudocrem.

Benzyl Isothiocyanate

Bencilo, isotiocinato de; Benzyl Mustard Oil; Benzylsenföl; Oleum Tropaeoli.

C_8H_7NS = 149.2.

CAS — 622-78-6.



Pharmacopoeias. *Fr.* includes Capucine (*Tropaeolum majus*).

Profile

Benzyl isothiocyanate is an oil obtained from *Tropaeolum majus* (Capuchin cress; common nasturtium) (Tropaeolaceae) that has been given as an antibacterial.

Tropaeolum majus has been used in herbal medicine.

Homoeopathy. *Tropaeolum majus* has been used in homoeopathic medicines.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ger.:*** Angocin Anti-Infekt N; Nephroselect M.

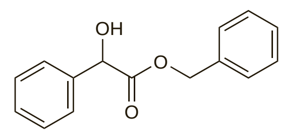
Benzyl Mandelate

Benzyl Phenylglycolate; Benzylin; Benzylis Mandelas; Benzylium Amygdalicum; Benzyl-DL-mandelate; Mandelsäurebenzylester.

Бензил Манделат

$C_{15}H_{14}O_3$ = 242.3.

CAS — 890-98-2.



Profile

Benzyl mandelate has been used for its antispasmodic actions. It has also been included in preparations with analgesics in an attempt to increase the analgesic effect.

Preparations

Proprietary Preparations (details are given in Part 3)

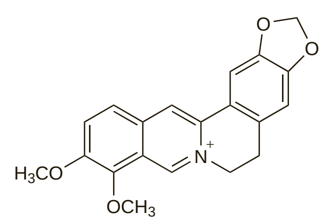
Multi-ingredient: ***Austria:*** Spasmo Claim; Spasmocor; ***Ger.:*** Fohnetten N†; ***Switz.:*** Seranex sans codeine†; ***Turk.:*** Spalt.

Berberine

Berberina. 5,6-Dihydro-9,10-dimethoxybenzo[g]-1,3-benzodioxolo[5,6-a]quinolizinium.

$C_{20}H_{18}NO_4$ = 336.4.

CAS — 2086-83-1 (berberine); 633-65-8 (berberine chloride); 633-66-9 (berberine sulfate).



Pharmacopoeias. *Chin.* includes berberine chloride. *Jpn* includes berberine chloride hydrate and berberine tannate. *Viet.* includes berberine chloride dihydrate.

Profile

Berberine is a quaternary alkaloid present in hydrastis, in various species of *Berberis*, and in many other plants. It has been used as a bitter and as a flavour in food and alcoholic drinks. It possesses antimicrobial activity and has also been tried as various salts in a number of infections.

Bergamot Oil

Bergamot Essence; Bergamota, aceite esencial de; Oleum Bergamottae.

Pharmacopoeias. In *Fr.* and *It.*

Profile

Bergamot oil is a greenish or brownish-yellow volatile oil with a characteristic fragrant odour and a bitter aromatic taste, obtained by expression from the fresh peel of fruit of *Citrus bergamia* (Rutaceae). Constituents include linalyl acetate and 5-methoxypsoralen (p.1607) and photosensitivity reactions have occurred following the topical use of preparations containing bergamot oil.

Bergamot oil is used in perfumery and as a flavour in Earl Grey tea. It has been included in some preparations for upper respiratory-tract disorders and hyperhidrosis. It is also used in aromatherapy.

◊ Muscle cramps have been reported[1] in a patient who drank up to 4 litres of 'Earl Grey' tea daily.

1. Finsterer J. Earl Grey tea intoxication. *Lancet* 2002; **359:** 1484.

Preparations

ATC Vet — QN07CA01.

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), and *US.*

Ph. Eur. 6.2 (Betahistine Dihydrochloride). A white to slightly yellow, very hygroscopic, powder. Very soluble in water; soluble in alcohol; practically insoluble in isopropyl alcohol. A 10% solution in water has a pH of 2.0 to 3.0. Store in airtight containers.

USP 31 (Betahistine Hydrochloride). A white to almost yellow, very hygroscopic, crystalline powder. Very soluble in water; freely soluble in alcohol; practically insoluble in isopropyl alcohol. pH of a 10% solution in water is between 2.0 and 3.0.

Betahistine Mesilate *(BANM, rINNM)*

Betahistiinimesilaatti; Betahistin-dimesylát; Bétahistine, mésilate de; Betahistine Mesylate; Betahistini Dimesilas; Betahistini mesilas; Betahistinmesilat; Betahistino mesilatas; Betahisztin-mezilát; Mesilato de betahistina. *N*-Methyl-2-(2-pyridyl)ethylamine bismethanesulphonate.

Бетагистина Мезилат

$C_8H_{12}N_2,(CH_4O_3S)_2$ = 328.4.
CAS — 54856-23-4.
ATC — N07CA01.
ATC Vet — QN07CA01.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.*

Ph. Eur. 6.2 (Betahistine Mesilate). A white or almost white, crystalline, very hygroscopic powder. Very soluble in water; freely soluble in alcohol; very slightly soluble in isopropyl alcohol. A 10% solution in water has a pH of 2.0 to 3.0. Store in airtight containers.

Adverse Effects

Gastrointestinal disturbances, headache, skin rashes, and pruritus have been reported.

Precautions

Betahistine should not be given to patients with phaeochromocytoma. It should be given with care to patients with asthma, peptic ulcer disease, or a history of peptic ulcer disease.

Porphyria. Betahistine hydrochloride is considered to be unsafe in patients with porphyria because it has been shown to be porphyrinogenic in *in-vitro* systems.

Uses and Administration

Betahistine is an analogue of histamine and is claimed to improve the microcirculation of the labyrinth resulting in reduced endolymphatic pressure. It is used to reduce the symptoms of vertigo (p.565), tinnitus (p.1866), and hearing loss associated with Ménière's disease (p.564).

Betahistine is given orally as the hydrochloride or mesilate. The usual initial dose (of the hydrochloride) is 16 mg three times daily taken preferably with meals; maintenance doses are generally in the range of 24 to 48 mg daily. Betahistine mesilate is used in similar doses.

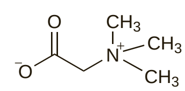
Betaine

Betaína; Glycine Betaine; Glycocoll Betaine; Lycine; Trimethylglycine. (Carboxymethyl)trimethylammonium hydroxide inner salt.

$C_5H_{11}NO_2$ = 117.1.
CAS — 107-43-7.
ATC — A16AA06.
ATC Vet — QA16AA06.



Betaine Hydrochloride

Betaiinihydrokloridi; Betaína, hidrocloruro de; Betainhydroklorid; Betaini Hydrochloridum; Trimethylglycine Hydrochloride. (Carboxymethyl)trimethylammonium hydroxide inner salt hydrochloride.

$C_5H_{11}NO_2,HCl$ = 153.6.
CAS — 590-46-5.
ATC — A09AB02.
ATC Vet — QA09AB02.

Pharmacopoeias. In *US.*

USP 31 (Betaine Hydrochloride). A white crystalline powder. Soluble in water and in alcohol; practically insoluble in chloroform and in ether. A 25% solution in water has a pH of 0.8 to 1.2.

Profile

Betaine is used as a methyl donor to remethylate homocysteine to methionine in the treatment of patients with homocystinuria (see Amino Acid Metabolic Disorders, p.1922). It is given orally in a usual dose of 3 g twice daily. Doses are adjusted according to plasma-homocysteine concentrations; up to 20 g daily has been required in some patients. In children under 3 years old, an initial dose of 100 mg/kg daily given in 2 divided doses may be used.

Severe cerebral oedema and hypermethioninaemia have been reported in a few patients, and it is recommended that plasma-methionine concentrations should be monitored at the start of betaine treatment and periodically thereafter. Patients being treated for cystathionine beta-synthase deficiency may pose particular problems because betaine may further raise their already elevated methionine concentrations increasing the risk of cerebral oedema.

Betaine has also been used as a variety of salts in preparations for liver and gastrointestinal disorders. The hydrochloride has been given as a source of hydrochloric acid in the treatment of hypochlorhydria.

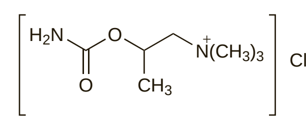
Bethanechol Chloride *(BAN)*

Betanecol, cloruro de; Betanekolikloridi; Betanekolklorid; Bethanecholi Chloridum; Carbamylmethylcholine Chloride. (2-Carbamoyloxypropyl)trimethylammonium chloride.

$C_7H_{17}ClN_2O_2$ = 196.7.
CAS — 674-38-4 (bethanechol); 590-63-6 (bethanechol chloride).
ATC — N07AB02.
ATC Vet — QN07AB02.



Pharmacopoeias. In *Jpn* and *US.*

USP 31 (Bethanechol Chloride). Colourless or white crystals, or white crystalline powder, usually having a slight, amine-like odour. It is hygroscopic and exhibits polymorphism. Freely soluble in water and in alcohol; insoluble in chloroform and in ether. pH of a 1% solution in water is between 5.5 and 6.5. Store in airtight containers.

Stability. References to the stability of oral liquid preparations of bethanechol chloride prepared extemporaneously from tablets.

1. Schlatter JL, Saulnier J-L. Bethanechol chloride oral solutions: stability and use in infants. *Ann Pharmacother* 1997; **31:** 294–6.
2. Allen LV, Erickson MA. Stability of bethanechol chloride, pyrazinamide, quinidine sulfate, rifampin, and tetracycline hydrochloride in extemporaneously compounded oral liquids. *Am J Health-Syst Pharm* 1998; **55:** 1804–9.

Sterilisation. The US manufacturers state that solutions of bethanechol chloride may be autoclaved at 120° for 20 minutes without discoloration or loss of potency.

Adverse Effects and Treatment

As described for choline esters under Acetylcholine Chloride, p.1877.

Precautions

As described for choline esters under Acetylcholine Chloride, p.1877.

Bethanechol should not be given by the intravenous or intramuscular routes as very severe muscarinic adverse effects are liable to occur, calling for emergency use of atropine.

Autonomic neuropathy. Patients with autonomic neuropathy might be more susceptible to the adverse effects of bethanechol and they should be started on low-dosage regimens and observed closely for signs of toxicity.[1]

1. Caraco Y, *et al.* Bethanechol-induced cholinergic toxicity in diabetic neuropathy. *DICP Ann Pharmacother* 1990; **24:** 327–8.

Interactions

As for Neostigmine, p.632.

Pharmacokinetics

Bethanechol chloride is poorly absorbed from the gastrointestinal tract. It is not hydrolysed by cholinesterases. At standard doses bethanechol does not cross the blood-brain barrier.

Uses and Administration

Bethanechol chloride, a choline ester, is a quaternary ammonium parasympathomimetic that mainly exhibits the muscarinic actions of acetylcholine (p.1877). It is not inactivated by cholinesterases so its actions are more prolonged than those of acetylcholine. Bethanechol chloride has little if any nicotinic activity and is used for its actions on the bladder and gastrointestinal tract. It has been used as an alternative to catheterisation in the treatment of urinary retention and has also been used for gastric atony and retention, abdominal distension following surgery, congenital megacolon, and gastro-oesophageal reflux disease.

Bethanechol chloride is given in usual doses of 5.15 mg subcutaneously or 10 to 50 mg orally, both up to 4 times daily, but dosage must be adjusted individually. Oral doses should be taken on an empty stomach. The effects usually occur within 5 to 15 minutes of a subcutaneous dose, or 30 to 90 minutes of an oral dose, and disappear within about 1 to 2 hours depending on the dose and route. However, large oral doses (300 to 400 mg) may produce effects for up to 6 hours. For a warning to avoid intravenous or intramuscular use, see under Precautions, above.

Decreased gastrointestinal motility. Parasympathomimetics such as bethanechol enhance gastric contractions and increase intestinal motility and form just one of many treatments that have been used in conditions associated with decreased gastrointestinal motility (p.1694).

Gastro-oesophageal reflux disease. Prokinetic drugs such as bethanechol have been tried in gastro-oesophageal reflux disease (p.1696).

References.

Stuttering. A double-blind placebo-controlled study[1] in 10 patients with stuttering (p.1001) on the whole failed to confirm an earlier report[2] of benefit using bethanechol although 2 patients who did respond elected to continue treatment after the study.

1. Kampman K, Brady JP. Bethanechol in the treatment of stuttering. *J Clin Psychopharmacol* 1993; **13:** 284–5.
2. Hays P. Bethanechol chloride in treatment of stuttering. *Lancet* 1987; **i:** 271.

Urinary incontinence and retention. Bethanechol is one of the parasympathomimetics that have been given to increase detrusor activity in patients with overflow incontinence, but there have been doubts about the effectiveness of such treatment (see p.2180). Bethanechol was also one of the parasympathomimetics used in the management of postoperative urinary retention but they have generally been superseded by catheterisation.

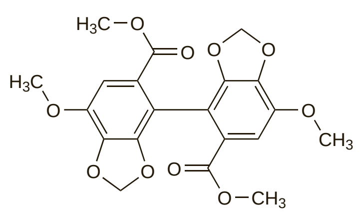
Bifendate

Dimethyl 7,7′-dimethoxy-(4,4′-bi-1,3-benzodioxole)-5,5′-dicarboxylate.

$C_{20}H_{18}O_{10}$ = 418.4.

CAS — 73536-69-3.



Pharmacopoeias. In *Chin.*

Profile

Bifendate is derived from schisandra (see p.2384). It is used in Chinese medicine for chronic hepatitis.

Bifendate has been reported to reduce blood concentrations of ciclosporin (see p.1826).

Bile Acids and Salts

Biliares, ácidos y sales.

CAS — 81-25-4 (cholic acid); 11006-55-6 (sodium tauroglycocholate); 361-09-1 (sodium cholate).

Pharmacopoeias. *Jpn* includes bear bile.

Profile

The principal primary bile acids, cholic acid and chenodeoxycholic acid (p.2280), are produced in the liver from cholesterol and are conjugated with glycine or taurine to give glycocholic acid, taurocholic acid, glycochenodeoxycholic acid, and taurochenodeoxycholic acid, before being secreted into the bile where they are present as the sodium or potassium salts (bile salts). Secondary bile acids are formed in the colon by bacterial deconjugation and 7α-dehydroxylation of cholic acid and chenodeoxycholic acid, producing deoxycholic acid and lithocholic acid, respectively. Ursodeoxycholic acid (p.2408) is a minor bile acid in man although it is the principal bile acid in *bears*. Dehydrocholic acid (p.2292) is a semisynthetic bile acid.

The total body pool of bile salts is about 3 g, and most of the secreted bile salts are reabsorbed in a process of enterohepatic recycling, so that only a small fraction of this amount must be synthesised *de novo* each day.

Bile salts are strongly amphiphilic; with the aid of phospholipids they form micelles and emulsify cholesterol and other lipids in bile. Oral administration of chenodeoxycholic acid also reduces the synthesis of cholesterol in the liver, while ursodeoxycholic acid reduces biliary cholesterol secretion apparently by increasing conversion of cholesterol to other bile acids. The bile acids (but not the bile salts) also have a choleretic action, increasing the secretion of bile, when given by mouth.

Chenodeoxycholic acid and ursodeoxycholic acid are given by mouth in the management of cholesterol-rich gallstones (p.2409) in patients unsuited to, or unwilling to undergo, surgery. Ursodeoxycholic acid is also being studied in some liver disorders.

Preparations containing bile salts have been used to assist the emulsification of fats and absorption of fat-soluble vitamins in conditions in which there is a deficiency of bile in the gastrointestinal tract. Ox bile has also been used in the treatment of chronic constipation. Cholic acid is used for the treatment of inborn errors in primary bile synthesis.

Sodium cholate has been used for its spermicidal properties in barrier contraceptives.

Birch Leaf

Abedul, hojas de; Beržų lapai; Betulae folium; Birkenblätter; Björkblad; Bouleau; Bouleau, feuille de; Březový list; Koivunlehti; Liść brzozy; Nyírfalevél; Silver Birch Leaf.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Birch Leaf). The whole or fragmented dried leaves of *Betula pendula* and/or *B. pubescens* as well as hybrids of both species. It contains not less than 1.5% of flavonoids, calculated as hyperoside ($C_{21}H_{20}O_{12}$ = 464.4), with reference to the dried drug. Protect from light.

Profile

Birch leaf is used in herbal medicine, particularly for urinary-tract disorders. Birch leaf oil has also been used.

Preparations

Proprietary Preparations (details are given in Part 3)

Black Catechu

Cutch.

CAS — 8001-76-1.

NOTE. Distinguish from Catechu (p.2278).

Pharmacopoeias. In *Chin.*

Profile

Black catechu is an extract from *Acacia catechu* (Leguminosae) that is used as an astringent.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***India:*** Arowash.

Black Currant

Blackcurrant; Cassis; Grosella negra (casis); Rib. Nig.

Pharmacopoeias. *Br.* includes the fruit.
Fr. includes the leaf.

BP 2008 (Black Currant). The fresh ripe fruits of *Ribes nigrum* together with their pedicels and rachides. It has a strong, characteristic odour and a pleasantly acidic taste.

Profile

Black currant fruit is a source of vitamin C (p.1983). It is used to prepare black currant syrup, which is used as a nutritional supplement and as a flavour.

Black currant leaf is included in herbal preparations for urinary, musculoskeletal, and gastrointestinal disorders. Black currant is reported to contain bioflavonoids and is also included in preparations for vascular disorders. It has also been used as a diuretic in folk medicine.

Black currant seed oil (below) is used as a source of gamolenic acid (see p.2308).

Preparations

BP 2008: Black Currant Syrup.

Proprietary Preparations (details are given in Part 3)
Braz.: Tiliv.

Multi-ingredient: ***Austria:*** Amersan; ***Cz.:*** Amersan; ***Fr.:*** Arkophytum†; Drainactil; Hydracur; IgeE; Maxidraine†; Mediflor no 11 Draineur Renal et Digestif†; Mediflor Tisane Antirhumatismale No 2; Mincifit; Resource Rhubagil; Veinobiase; ***Ger.:*** Venobiase†; ***Ital.:*** Nepiros; Ribovir; ***Pol.:*** Melisal; Melissed; ***Spain:*** Exodren; Fitosvelt†.

Black Currant Seed Oil

Blackcurrant seed oil.

Profile

Black currant seed oil is derived from the seeds of *Ribes nigrum* (Grossulariaceae). It contains gamolenic acid (p.2308) and is used similarly to evening primrose oil (p.2302).

Preparations

Proprietary Preparations (details are given in Part 3)
Austral.: Proglan†.

Black Haw

American Sloe; Nanny Bush; Stag Bush.

Калина Сливолистная

Pharmacopoeias. In *Fr.*

Profile

The bark of black haw, *Viburnum prunifolium* (Adoxaceae) is claimed to have spasmolytic activity on uterine and other smooth muscle. It is included in herbal preparations for peripheral vascular disorders and menstrual disorders. The root bark is also used.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Braz.:*** Bromidrastina†; Gineburno†; ***Canad.:*** Thunas Tab for Menstrual Pain†; ***Fr.:*** Aphloine P; Climaxol; Jouvence de l'Abbe Soury; Phlebosedol†; ***Mex.:*** Reglosedyl†; ***Mon.:*** Fluon.

Black Nightshade

Hierba mora; Morelle Noire.

Profile

Black nightshade is the leaves and flowering tops of the black or garden nightshade, *Solanum nigrum* (Solanaceae). It contains solanine and its allied alkaloids. Black nightshade is distributed throughout most of the world as a weed of cultivation. It appears to have little medicinal value but was used in liniments, poultices, and decoctions for external application. Ingestion can cause typical antimuscarinic effects that may require treatment as described under Atropine, p.1220.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Pol.:*** Liv 52; ***Rus.:*** Dipana (Дипана); Liv 52 (Лив 52).

Blackthorn

Black Thorn; Épine noir; Prugnolo; Prundlier; Schlehe; Schwarzdorn; Sloe.

Тёрн; Терновник

Profile

The flowers of the blackthorn or sloe, *Prunus spinosa* (Rosaceae), are included in herbal preparations for constipation and urinary-tract disorders.

The fruit (sloes) are used for mild inflammation of oral and pharyngeal mucosa.

Prunus spinosa is used in homoeopathic medicine.

Culinary uses of sloes include preserves and as a flavour in alcoholic beverages.

Preparations

Proprietary Preparations (details are given in Part 3)
S.Afr.: Schlehen Elixir.

Multi-ingredient: ***Ger.:*** Nasenbalsam; Nasenbalsam fur Kinder; ***S.Afr.:*** Lotio Pruni Comp cum Cupro; ***Switz.:*** Wala Baume nasal; Wala Baume nasal doux.

Blue Cohosh

Caulófilo; Caulophyllum; Papoose Root; Squaw Root.

NOTE. Distinguish from Black Cohosh, which is Cimicifuga, p.2282.

Profile

Blue cohosh, the rhizome and roots of *Caulophyllum thalictroides* (Berberidaceae), has uterotonic and antirheumatic properties. It is used for menstrual and other gynaecological disorders.

Homoeopathy. Blue cohosh has been used in homoeopathic medicines under the following names: Caulophyllum; Caulophyllum thalictroides; Caulph.

Adverse effects. Acute myocardial infarction associated with profound congestive heart failure and shock has been reported in a newborn infant whose mother ingested blue cohosh to promote uterine contractions.[1]

1. Jones TK, Lawson BM. Profound neonatal congestive heart failure caused by maternal consumption of blue cohosh herbal medication. *J Pediatr* 1998; **132:** 550–2.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Dyzco; Lifesystem Herbal Formula 4 Women's Formula†; Women's Formula Herbal Formula 3†.

Bog Myrtle

Sweet Gale.

NOTE. Bog myrtle has also been used as a common name for *Menyanthes trifoliata* (see Menyanthes, p.2340). Bayberry (see p.2263) has also been used as a synonym for bog myrtle.

Profile

The essential oil obtained from bog myrtle, *Myrica gale* (Myricaceae), has been used as an insect repellent.

Preparations

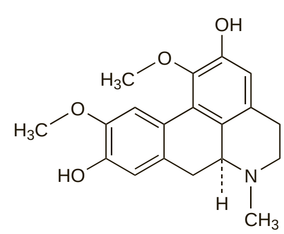
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** MozzyOff Cocktail.

Boldo

Boldi folium; Boldo, feuille de; Boldo Folium; Boldo Leaves; Boldoblad; Boldólevél; Boldonlehti; Boldovníkový list; Kvapiųjų čilmedžių lapai; Liść boldo; Peumus.

CAS — 476-70-0 (boldine); 1398-22-7 (boldoglucin).



(boldine)

Pharmacopoeias. In *Eur.* (see p.vii), which also includes Boldo Leaf Dry Extract.
Fr. includes Boldine.

Ph. Eur. 6.2 (Boldo Leaf). The whole or fragmented dried leaf of *Peumus boldus*. It contains not more than 4% v/w of essential oil calculated with reference to the anhydrous drug. It contains not less than 0.1% of total alkaloids, expressed as boldine ($C_{19}H_{21}NO_4$ = 327.4), calculated with reference to the anhydrous drug. It has a characteristic odour especially when rubbed. Protect from light.

Profile

Boldo is employed in herbal medicine as a diuretic, for hepatobiliary disorders and for gastrointestinal disorders such as constipation. The alkaloid boldine is also used.

Homoeopathy. Boldo has been used in homoeopathic medicines under the following names: Peumus boldus.

Preparations

Proprietary Preparations (details are given in Part 3)
Braz.: Prinachol; ***Mex.:*** Bliz.

Multi-ingredient: ***Arg.:*** Bil 13; Biliosan Compuesto†; Boldina; Digenat; Dioxicolagol; Drenocol†; Hepacur; Hepatalgina; Hepatodirectol; Hepatotal Family†; Herbaccion Dig Fresh†; Herbaccion Digestivo†; Metiogen; Opobyl; Radicura; Trixol†; ***Austral.:*** Berberis Complex; Lexat†; ***Austria:*** St Bonifatius-Tee; ***Braz.:*** Alcafelol†; Alcaflor†; Bilifel†; Boldopeptan†; Boljuprima†; Colachofra; Dorveran†; Ductoveran; Emagrevit†; Eparema; Figatil; Gotas Digestivas; Hepatoregius†; Jurubileno†; Solvobil; ***Chile:*** Hepabil; Nature Complex Reduct-Te; Reduc-Te; Te Laxante; ***Cz.:*** The Salvat; ***Fr.:*** Bolcitol; Drainactil; Elixir Spark; Grains de Vals; Hepaclem; Hepax; Jecopeptol; Mediflor no 11 Draineur Renal et Digestif†; Mediflor Tisane Hepatique No 5; Mucinum a l'Extrait de Cascara; Opobyl; Oxyboldine; Petites Pilules Carters; Solution Stago Diluee; Tisane Hepatique de Hoerdt; Vegelax†; ***Ger.:*** Cynarzym N†; Gallemolan G†; Heumann Leber- und Gallentee Solu-Hepar S†; Heumann Verdauungstee Solu-Lipar; ***Hong Kong:*** Mucinum Cascara†; ***Ital.:*** Amaro Medicinale; Boldina He; Caramelle alle Erbe Digestive; Coladren; Colax; Confetti Lassativi CM; Critichol; Digelax†; Dis-Cinil Complex; Eparema; Eparema-Levul; Eupatol; Frangulina†; Hepatos; Hepatos B12; Magisbile†; Mepalax; Schias-Amaro Medicinale†; Solvobil; ***Mex.:*** Chofabol; Hepedren; Ifuchol; Peptochol†; ***Pol.:*** Boldaloin; Boldovera; ***Port.:*** Mucinum; ***Spain:*** Boldolaxin†; Menabil Complex†; Natusor Hepavesical†; Nico Hepatocyn; Odisor†; Opobyl; Resolutivo Regium; Solucion Schoum; ***Switz.:*** Boldocynara; Heparfelien; Stago N†; Tisane hepatique et biliaire; ***UK:*** Adios; Boldex; HealthAid Boldo-Plus; Weight Loss Aid; ***Venez.:*** Cynascool; Natrossil.

Boneset

Feverwort; Thoroughwort.

NOTE. Boneset has also been used as a common name for *Symphytum officinale* (see Comfrey, p.2286).

Profile

Boneset, the aerial parts of *Eupatorium perfoliatum* (Compositae), has diaphoretic and immunostimulant properties and has been used in the treatment of fever, influenza, the common cold, and other upper respiratory-tract disorders.

Homoeopathy. Boneset has been used in homoeopathic medicines under the following names: Eupatorium perfoliatum; Eup. perf.

◊ References.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Flavons; ***UK:*** Catarrh Mixture.

Borage

Borraja; Bourrache.

Pharmacopoeias. *Fr.* includes monographs for flowers and flowering tops.

Profile

The aerial parts of borage *Borago officinalis* (Boraginaceae), have been used in herbal medicine as a demulcent and emollient. However, it contains pyrrolizidine alkaloids that may be toxic and internal use is not recommended.

Borage seeds are the source of borage oil (below), which is used as a source of gamolenic acid.

Preparations

Proprietary Preparations (details are given in Part 3)
Chile: Dexol.

Multi-ingredient: ***Chile:*** Celltech Gold; ***Ital.:*** Sclerovis H; ***Mex.:*** Aveendix; ***NZ:*** Mr Nits.

Borage Oil

Boraginis Oleum; Borago officinalis oleum; Borraja, aceite de; Bourrache, huile de; Brutnákový olej; Gurkörtolja; Purasruohoöljy; Starflower Oil; Vaistinių agurklių aliejus.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Borage (Starflower) Oil, Refined; Refined Borage Oil BP 2008). The fatty oil obtained from seeds of *Borago officinalis* by extraction and/or expression. It is then refined. A suitable antioxidant may be added. A clear, light yellow or yellow liquid. Relative density about 0.921. Practically insoluble in water and in alcohol; miscible with petroleum spirit. Store in well-filled, airtight containers under an inert gas. Protect from light.

The BP 2008 gives Refined Starflower Oil as an approved synonym.

Profile

Borage oil is a source of essential fatty acids, principally gamolenic acid (p.2308). It is included in dietary supplements, often in combination with fish oils or other sources of omega-3 fatty acids (see p.1362).

Eczema. For the effects of borage oil on eczema, see under Gamolenic Acid, p.2308.

Rheumatoid arthritis. For the use of borage oil as a source of gamolenic acid for the management of rheumatoid arthritis, see under Gamolenic Acid, p.2309.

Preparations

Proprietary Preparations (details are given in Part 3)

Braz.: Tiliv L; ***Fr.:*** Gamatol†; Omegaline; ***Malaysia:*** Primolin GLA MAX†; ***Pol.:*** Biogal†; Neoglandyna; ***Switz.:*** Boracaps; ***UK:*** Floresse.

Borax

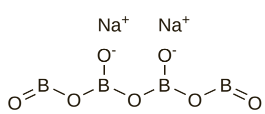
Booraksi; Boraksas; Bórax; Disodium Tetraborate; Disodu tetraboran; E285; Natrii Tetraboras; Natrii Tetraboras Decahydricus; Natrium Boricum; Nátrium-tetraborát; Purified Borax; Sodium Biborate; Sodium Borate; Sodium Pyroborate; Sodium Tetraborate; Sodu tetraboran; Tetraboritan sodný dekahydrát.

$Na_2B_4O_7,10H_2O = 381.4.$

CAS — 1330-43-4 (anhydrous borax); 61028-24-8 (anhydrous borax); 1303-96-4 (borax decahydrate).

ATC — S01AX07.

ATC Vet — QS01AX07.



Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *Jpn.* Also in *USNF.*

Ph. Eur. 6.2 (Borax). Colourless crystals or crystalline masses, or white or almost white, crystalline powder. It effloresces. Soluble in water; very soluble in boiling water; freely soluble in glycerol. A 4% solution in water has a pH of 9.0 to 9.6.

The BP 2008 gives Sodium Borate and Sodium Tetraborate as official synonyms.

USNF 26 (Sodium Borate). Odourless transparent colourless crystals or white crystalline powder. Its solutions are alkaline to phenolphthalein. It effloresces in warm dry air. Soluble 1 in 16 of water, 1 in 1 of boiling water, and 1 in 1 of glycerol; insoluble in alcohol. Store in airtight containers.

Boric Acid

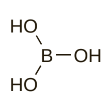
Acide borique; Ácido bórico; Acidum boricum; Boorihappo; Boracic Acid; Borato rūgštis; Borsäure; Bórsav; Borsyra; E284; Kwas borowy; Kyselina boritá; Orthoboric Acid; Sal Sedativa de Homberg.

$H_3BO_3 = 61.83.$

CAS — 10043-35-3.

ATC — S02AA03.

ATC Vet — QS02AA03.



Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Jpn,* and *Viet.* Also in *USNF.*

Ph. Eur. 6.2 (Boric Acid). Colourless shiny plates greasy to the touch, or white or almost white crystals, or white or almost white crystalline powder. Soluble in water and in alcohol; freely soluble in boiling water and in glycerol (85%). A 3.3% solution in water has a pH of 3.8 to 4.8.

USNF 26 (Boric Acid). Odourless, colourless, somewhat pearly lustrous scales, or crystals, or white powder, slightly unctuous to the touch. Soluble 1 in 18 of water, 1 in 4 of boiling water, 1 in 18 of alcohol, 1 in 6 of boiling alcohol, and 1 in 4 of glycerol.

Stability. Boric acid volatilises in steam. It forms a complex with glycerol which is a stronger acid than boric acid.

Adverse Effects, Treatment, and Precautions

The main symptoms of acute boric acid poisoning are vomiting and diarrhoea, abdominal pain, an erythematous rash involving both skin and mucous membranes, followed by desquamation, and stimulation or depression of the CNS. There may be convulsions and hyperpyrexia. There may also be renal tubular damage. Abnormal liver function and jaundice have been reported rarely. Death, resulting from circulatory collapse and shock, may occur within several days.

The slow excretion of boric acid can lead to cumulative toxicity during repeated use. Symptoms of chronic intoxication include anorexia, gastrointestinal disturbances, debility, confusion, dermatitis, menstrual disorders, anaemia, convulsions, and alopecia.

Fatalities have occurred most frequently in young children after the accidental ingestion of solutions of boric acid or after the application of boric acid powder to abraded skin.

In the UK the use of boric acid, borates, and tetraborates in cosmetics is controlled: the concentration is limited to 5% in talcs, to 0.1% in products for oral hygiene, and to 3% in other cosmetic products; tetraborates are limited to 18% in bath products. Such cosmetic products should not be used in children under 3 years of age; preparations used for oral hygiene should not be swallowed; and topical preparations containing greater than the equivalent of 1.5% of boric acid should not be applied to peeling or irritated skin.

Deaths have resulted from absorption after lavage of body cavities with solutions of boric acid, and this practice is no longer recommended.

Inhaled boric acid and borax are pulmonary irritants.

Treatment of poisoning is symptomatic. The stomach should be emptied if the patient presents within 1 hour of ingesting a large amount of boric acid; activated charcoal is not effective. Haemodialysis may be of value in severe cases.

◊ In Great Britain pharmacists have been advised not to sell boric acid as such for use as a dusting powder (see also above). Pharmacists have also been advised not to supply Borax Glycerin or Honey of Borax, even with an appropriate warning, because of the hazards associated with the use of these preparations in infants.

Pharmacokinetics

Boric acid is absorbed from the gastrointestinal tract, from damaged skin, from wounds, and from mucous membranes. It does not readily penetrate intact skin. About 50% of the amount absorbed is excreted in the urine within 24 hours and most of the remainder is excreted within 96 hours of ingestion.

Uses and Administration

Boric acid possesses weak bacteriostatic and fungistatic properties; it has generally been superseded by more effective and less toxic disinfectants. It is used as a pesticide against ants and cockroaches.

Boric acid is used, usually with borax, as a buffer and antimicrobial in eye drops, and was formerly used as a soluble lubricant in solution-tablets. It is also used as a preservative for urine samples. Boric acid and borax are not used internally.

In the UK, the use of boric acid in cosmetics and toiletries is restricted (see above).

Borax is used similarly to boric acid and has also been used externally as a mild astringent and as an emulsifier in creams. Preparations of borax in glycerol or in honey (Borax Glycerin; Honey of Borax) were formerly used as paints for the throat, tongue, and mouth, but should not be used because of the risk of toxicity.

Other salts of boric acid, including potassium and zinc salts, have been used.

Homoeopathy. Boric acid has been used in homoeopathic medicines under the following names: Acidum boricum; Acidum Boracicum; Ac. boric.

Borax has been used in homoeopathic medicines under the following names: Natrium tetraboracicum.

Antimicrobial activity. Evaluation of the antimicrobial activity of 1.22% borate buffer.[1]

1. Houlsby RD, *et al.* Antimicrobial activity of borate-buffered solutions. *Antimicrob Agents Chemother* 1986; **29:** 803–6.

Urine preservation. Boric acid in concentrations of about 2% may be a suitable preservative for urine samples in transit requiring bacteriological examination.[1,2] However, overnight storage of specimens preserved with boric acid may significantly alter culture results.[3]

1. Porter IA, Brodie J. Boric acid preservation of urine samples. *BMJ* 1969; **2:** 353–5.

3. Gillespie T, *et al.* The effect of specimen processing delay on borate urine preservation. *J Clin Pathol* 1999; **52:** 95–8.

Vaginitis. Vaginal candidiasis (p.518) caused by *Candida glabrata* and other non-*albicans* species frequently responds to topical boric acid.[1,2] Satisfactory clinical and mycological responses to topical boric acid were reported in 2 patients with *Candida glabrata* vaginitis who had not responded to repeated courses of azole antifungals.[3] Treatment with boric acid effected clinical and mycological cure in 4 of 6 patients with refractory vaginitis caused by *C. krusei.*[4] Long-term boric acid treatment showed promise in the treatment and prevention of relapses of vulvovaginal candidiasis, but its efficacy ended when treatment was stopped.[5]

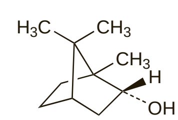
Borneol

Baros Camphor; Bhimsaim Camphor; Borneo Camphor; Borneokampfer; Bornyl Alcohol; Camphol; Dryobalanops Camphor; Malayan Camphor; Sumatra Camphor. *endo*-1,7,7-Trimethylbicyclo[2.2.1]heptan-2-ol.

Борнеол

$C_{10}H_{18}O = 154.2.$

CAS — 507-70-0.



Pharmacopoeias. In *Chin* as synthetic borneol (Borneolum Syntheticum).

Profile

Borneol is a constituent of several essential oils. It has antiseptic and antispasmodic actions and is included in preparations for the treatment of biliary- and urinary-tract disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

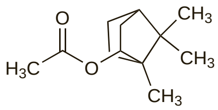
Multi-ingredient: ***Austria:*** Rowachol; Rowatinex; ***Chile:*** Rowatinex; ***Cz.:*** Rowachol; Rowatinex; ***Fr.:*** Biolau; ***Ger.:*** Rowachol; Rowachol comp†; Rowachol-Digestiv; Rowatinex; ***Hong Kong:*** Neo-Rowachol; Neo-Rowatinex; Rowachol; Rowatinex; ***Hung.:*** Rowachol; Rowatinex; ***Irl.:*** Rowachol; Rowatinex; ***Israel:*** Rowachol; Rowatinex; ***Malaysia:*** Rowachol; Rowatinex; ***Mex.:*** Cholex; ***Philipp.:*** Mentopas; Rowachol; Rowatinex; ***Pol.:*** Rowachol; Rowatinex; Terpichol; ***Singapore:*** New Daigaku†; ***Spain:*** Rowachol; Rowanefrin; ***Switz.:*** Rowachol; ***Thai.:*** Rowachol; Rowatinex; ***UK:*** Rowachol; ***Venez.:*** Rowachol; Rowatinex.

Bornyl Acetate *(USAN)*

Borneol Acetate; Bornilo, acetato de; Bornylu octan. 1,7,7-Trimethylbicyclo[2.2.1]heptan-2-ol acetate.

$C_{12}H_{20}O_2$ = 196.3.

CAS — 76-49-3.



Profile

Bornyl acetate is a constituent of some essential oils. It has been used in aromatic preparations in the treatment of coughs, other respiratory-tract disorders, and musculoskeletal and joint disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Jabonacid; ***Chile:*** Expanden; ***Ger.:*** Lindofluid N.

Bromelains *(BAN, USAN, rINN)*

Bromelaiinit; Bromelaína; Bromelaina; Bromelainer; Bromelainy; Broméläïones; Bromelins; Plant Protease Concentrate.

Бромелаины

CAS — 9001-00-7.

ATC — B06AA11.

ATC Vet — QB06AA11.

Units

One Rorer unit of protease activity has been defined as that amount of enzyme which hydrolyses a standardised casein substrate at pH 7 and 25° so as to cause an increase in absorbance of 0.00001 per minute at 280 nm. FIP units are also defined in terms of rate of hydrolysis of bromelain activity of a casein preparation under standard conditions.

Activity has also been described in terms of milk-clotting units.

Adverse Effects

Bromelains may cause nausea, vomiting, and diarrhoea. Metrorrhagia and menorrhagia have occasionally occurred. Hypersensitivity reactions have been reported and have included skin reactions and asthma.

Effects on the respiratory system. Bronchial asthma was experienced by 2 patients after exposure to bromelains.[1] Of 6 workers sensitised to papain, 5 showed positive skin tests to bromelains and 2 of them also showed immediate asthmatic reactions after bronchial challenge with bromelains.[2]

1. Galleguillos F, Rodriguez JC. Asthma caused by bromelin inhalation. *Clin Allergy* 1978; **8:** 21–4.
2. Baur X, Fruhmann G. Allergic reactions, including asthma, to the pineapple protease bromelain following occupational exposure. *Clin Allergy* 1979; **9:** 443–50.

Precautions

Bromelains should be given with care to patients with coagulation disorders or with severe hepatic or renal impairment.

Uses and Administration

Bromelains are a concentrate of proteolytic enzymes derived from the pineapple plant, *Ananas comosus* (*A. sativus*) (Bromeliaceae). They are used as an adjunct in the treatment of soft-tissue inflammation and oedema associated with trauma and surgery. Bromelains have also been given as an aid to digestion, and used in the treatment of partial deep dermal and full thickness burns.

Bromides

Bromuros.

ATC — N05CM11.

ATC Vet — QN05CM11.

Ammonium Bromide

Ammon. Brom.; Ammonii bromidum; Ammonium Bromatum; Ammonium, bromure d'; Ammoniumbromid; Ammónium-bromid; Ammoniumbromidi; Amonio bromidas; Amonowy bromek; Brometo de Amônio; Bromid amonný.

NH_4Br = 97.94.

CAS — 12124-97-9.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Ammonium Bromide). A white or almost white, hygroscopic crystalline powder or colourless crystals. It becomes yellow when exposed to light or air. Freely soluble in water; sparingly soluble in alcohol. Store in airtight containers. Protect from light.

Potassium Bromide

Brometo de Potássio; Bromid draselný; Bromure de Potassium; Kalii bromidum; Kalio bromidas; Kalium Bromatum; Kaliumbromid; Kálium-bromid; Kaliumbromidi; Pot. Brom.; Potassii Bromidum; Potassium, bromure de; Potasu bromek.

KBr = 119.0.

CAS — 7758-02-3.

Pharmacopoeias. In *Eur.* (see p.vii), *Jpn, US,* and *Viet.*

Ph. Eur. 6.2 (Potassium Bromide). A white or almost white, crystalline powder or colourless crystals. Freely soluble in water and in glycerol; slightly soluble in alcohol.

USP 31 (Potassium Bromide). A white crystalline powder or colourless, cubical crystals. Freely soluble in water and in glycerol; slightly soluble in alcohol.

Sodium Bromide

Brometo de Sódio; Bromid sodný; Bromure de Sodium; Natrii bromidum; Natrio bromidas; Natrium Bromatum; Natriumbromid; Nátrium-bromid; Natriumbromidi; Sod. Brom.; Sodii Bromidum; Sodium, bromure de; Sodu bromek.

NaBr = 102.9.

CAS — 7647-15-6.

Pharmacopoeias. In *Eur.* (see p.vii), *Jpn, US,* and *Viet.*

Ph. Eur. 6.2 (Sodium Bromide). A slightly hygroscopic, white or almost white, granular powder, or small, colourless, transparent, or opaque crystals. Freely soluble in water; soluble in alcohol. Store in airtight containers.

USP 31 (Sodium Bromide). A white crystalline powder or colourless, cubical crystals. Freely soluble in water; soluble in alcohol.

Adverse Effects and Precautions

During prolonged exposure bromide accumulation may occur giving rise to bromide intoxication or bromism. Symptoms include nausea and vomiting, anorexia, confusion, behavioural disturbances, slurred speech, memory impairment, drowsiness, irritability, ataxia, tremors, hallucinations, mania, delirium, psychoses, stupor, coma, and other manifestations of CNS depression. Skin rashes of various types may occur and toxic epidermal necrolysis has been reported. Death after acute poisoning appears to be rare as vomiting follows the ingestion of large doses.

There have been reports of neonatal bromide intoxication and growth defects associated with maternal bromide ingestion during pregnancy.

Breast feeding. The American Academy of Pediatrics[1] considers that intake of bromides is usually compatible with breast feeding, although rashes, weakness, and absence of crying have been reported in the infant following maternal intake. Exposure to bromides in photographic laboratories may also result in potential absorption and transfer into breast milk.

1. American Academy of Pediatrics. The transfer of drugs and other chemicals into human milk. *Pediatrics* 2001; **108:** 776–89. Correction. *ibid.*; 1029. Also available at: http://pediatrics.aappublications.org/cgi/content/full/108/3/776 (accessed 22/07/08)

Treatment of Adverse Effects

In acute poisoning, the stomach should be emptied (if emesis has not already occurred), and sodium chloride should be given by intravenous infusion. Glucose may also be used and furosemide may be given to aid diuresis.

In chronic poisoning, bromides are stopped and sodium chloride is given intravenously or orally with adequate amounts of fluid. Ammonium chloride has been given but is no longer recommended as it may precipitate metabolic acidosis. Diuretics are of value. In severe cases of bromide intoxication, or when the usual treatments cannot be used, haemodialysis may be of benefit.

Pharmacokinetics

Bromides are readily absorbed from the gastrointestinal tract. They displace chloride in extracellular body fluids and have a half-life in the body of about 12 days. They may be detected in the milk of nursing mothers and in the fetus.

Uses and Administration

Bromides depress the CNS. Calcium, potassium, and sodium bromide have been used as sedatives and anticonvulsants, but have generally been replaced by more effective, less toxic drugs. Ammonium and strontium bromide have been used similarly, as have bromoform and dilute hydrobromic acid. Bromides have also been used in multi-ingredient preparations for the treatment of coughs.

Homoeopathy. Hydrobromic acid and various bromides have been used in homoeopathic medicines under the following names:

- Hydrobromic acid: Hydr. ac.
- Ammonium bromide: Ammonium bromatum; Ammonium bromidum; Amm. brom.
- Arsenic bromide: Arsenicum bromatum; Ars. brom.
- Cadmium bromide: Cadmium bromatum; Cad. brom.
- Calcium bromide: Calcarea bromata; Calc. bro.
- Ferrous bromide: Ferrum bromatum; Fer. brom.
- Potassium bromide: Kalium bromatum; Kali bromatum; Kali. br.
- Sodium bromide: Natrum bromatum; Nat. brom.
- Radium bromide: Rad. br.
- Zinc bromide: Zincum bromatum; Zinc. br.

Preparations

Proprietary Preparations (details are given in Part 3)

Ger.: Dibro-Be Mono.

Multi-ingredient: ***Braz.:*** Alergitrat†; Bromidrastina†; Frenotosse; Gotas Nican†; Naquinto†; Xarope de Caraguata†; Xarope Peitoral de Ameixa Composto†; Xarope Sao Joao†; Xpe SPC†; ***Chile:*** Gotas Nican†; Gruben; Ramistos; ***Fr.:*** Galirene†; Sedatif Tiber; ***Indon.:*** Thymcal; ***Ital.:*** Fertomcidina-U; ***Pol.:*** Sal Ems Factitium; ***S.Afr.:*** Bronchicum†; ***Spain:*** Topico Denticion Vera†.

Bromine

Brom; Bromo; Bromum.

Br_2 = 159.808.

CAS — 7726-95-6.

Description. Bromine is a dark reddish-brown, heavy, mobile liquid that gives off intensely irritating brown fumes.

Adverse Effects

Bromine is intensely irritating and corrosive to eyes and mucous membranes; it may cause severe gastro-enteritis if swallowed. Contact with the skin can produce severe burns, and inhalation of the vapour causes violent irritation of the respiratory tract and pulmonary oedema.

Treatment of Adverse Effects

Milk or antacids should be given as soon as possible following ingestion of bromine. Gastric lavage is not recommended. If bromine vapour has been inhaled, oxygen should be administered and assisted ventilation may be necessary. The use of prophylactic corticosteroids for laryngeal and pulmonary oedema is controversial. Splashes on the skin and eyes should be immediately washed off; washing under running water should continue for at least 15 minutes.

Uses and Administration

Bromine is widely used in industry. It was formerly used, in the form of an adduct with a quaternary ammonium compound, in the treatment of plantar warts.

Bryonia

Bryony; Nueza.

Profile

Bryonia, the root of *Bryonia alba* or *B. dioica* (Cucurbitaceae), is an ingredient of preparations that have been used in respiratory-tract infections and inflammatory disorders. Toxic symptoms and fatalities have been reported after ingestion of the berries.

Homoeopathy. Bryonia has been used in homoeopathic medicines under the following names: Bryonia cretica; Bryonia e radice; Bry. cre.; Bryonia alba; Bry. alba.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Cough Relief†; Joint & Muscle Cream; ***Cz.:*** Homeovox; ***Fr.:*** Homeoplasmine; ***Mex.:*** Reudol.

Buchu

Barosma; Bucco; Buchú; Buchu Leaves; Diosma; Folia Bucco.

CAS — 68650-46-4 (buchu leaf oil).

Pharmacopoeias. In *Fr.*, which allows the dried leaves of *Agathosma betulina* (short or round buchu), *A. crenulata* (oval buchu), and *A. serratifolia* (long buchu).

Profile

Buchu, the dried leaves of 'short' or 'round' buchu, *Agathosma betulina* (*Barosma betulina*) (Rutaceae), is a weak diuretic and urinary antiseptic that has been used in multi-ingredient preparations for the treatment of urinary-tract disorders. Oval or long buchu, the leaves of *Agathosma crenulata* (*B. crenulata*), has also been used. The name long buchu is also applied to *A. serratifolia* (*B. serratifolia*). The leaves of *A. serratifolia* are also used medicinally.

Buchu leaf oil, usually from *A. betulina*, is occasionally promoted for use in aromatherapy, although it is rarely used in practice.

Homoeopathy. Buchu has been used in homoeopathic medicines under the following names: Barosma crenata; Bar. cren.; Barosma serratifolia; Bar. ser.

Preparations

Proprietary Preparations (details are given in Part 3)

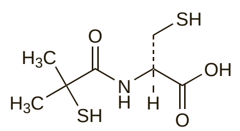
Multi-ingredient: ***Arg.:*** Water Pill c Potasio†; ***Austral.:*** Althaea Complex; Bioglan Cranbiotic Super; Cranberry Complex; De Witts New Pills; Extralife Uri-Care; Fluid Loss†; Medinat PMT-Eze†; PMS Support†; Serenoa Complex†; Urinase†; Uva-Ursi Complex†; ***Canad.:*** Herbal Diuretic; Herbal Laxative plus Yogurt; ***Cz.:*** Epilobin; ***Fr.:*** Urophytum†; ***NZ:*** De Witts Pills†; ***S.Afr.:*** Borstol Cough Remedy; Doans Backache Pills; Docrub; ***Switz.:*** Heparfelien; Urinex; ***UK:*** Antitis; Backache; Backache Relief; De Witt's K & B Pills; Diuretabs; HRI Water Balance; Kas-Bah; Skin Eruptions Mixture; Watershed.

Bucillamine *(rINN)*

Bucilamina; Bucillaminum; DE-019; SA-96; Tiobutarit. *N*-(2-Mercapto-2-methylpropionyl)-L-cysteine.

Буцилламин

$C_7H_{13}NO_3S_2$ = 223.3.
CAS — 65002-17-7.
ATC — M01CC02.
ATC Vet — QM01CC02.



Pharmacopoeias. In *Jpn.*

Profile

Bucillamine is structurally related to penicillamine (p.1456) and is reported to be an immunomodulator that has been used in the treatment of rheumatoid arthritis.

Adverse effects. Bucillamine has been implicated in the development of skin,[1] kidney,[2,3] and lung disorders.[4]

1. Ogata K, *et al.* Drug-induced pemphigus foliaceus with features of pemphigus vulgaris. *Br J Dermatol* 2001; **144:** 421–2.

4. Saito Y, *et al.* A case of bucillamine-induced interstitial pneumonia with positive lymphocyte stimulation test for bucillamine using bronchoalveolar lavage lymphocytes. *Intern Med* 2007; **46:** 1739–43.

Preparations

Proprietary Preparations (details are given in Part 3)
Jpn: Rimatil.

Buckwheat

Blé Noir; Boekweit; Boveteört (aerial parts); Buchweizen; Fagopyri Herba (aerial parts); Grano Turco; Grikių žolė (aerial parts); Pohanková nať (aerial parts); Sarrasin; Sarrasin Commun; Viljatatar (aerial parts); Ziele gryki.

Гречиха Обыкновенная

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Buckwheat Herb; Fagopyri Herba). The whole or cut aerial parts of *Fagopyrum esculentum*. It contains a minimum 4.0% of rutoside, calculated with reference to the dried drug. Protect from light.

Profile

The aerial parts of buckwheat, *Fagopyrum esculentum* (Polygonaceae), are included in herbal preparations for chronic venous insufficiency.

Buckwheat contains flavonoids and is a source of rutoside (see p.2305).

Homoeopathy. Buckwheat has been used in homoeopathic medicines under the following names: Fagopyrum; Fagopyrum esculentum Fago. esc.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Fagorutin Buchweizen.

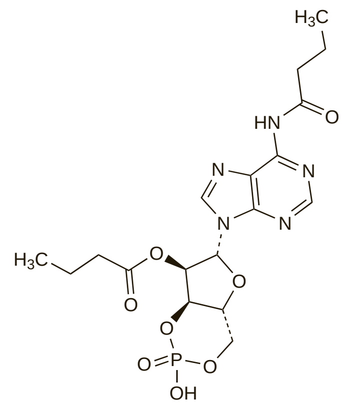
Multi-ingredient: ***Fr.:*** Flebior; ***Ger.:*** Fagorutin Buchweizen; ***Pol.:*** Betasol; Fitoven.

Bucladesine Sodium *(rINNM)*

Bucladesina sódica; Bucladésine Sodique; DBcAMP (bucladesine); Dibutyryl Cyclic AMP Sodium; DT-5621 (bucladesine); Natrii Bucladesinum. *N*-(9-β-D-Ribofuranosyl-9*H*-purin-6-yl)butyramide cyclic 3′,5′-(hydrogen phosphate) 2′-butyrate sodium.

Натрий Букладезин

$C_{18}H_{24}N_5O_8PNa$ = 492.4.
CAS — 362-74-3 (bucladesine); 16980-89-5 (bucladesine sodium).
ATC — C01CE04.
ATC Vet — QC01CE04.



(bucladesine)

Profile

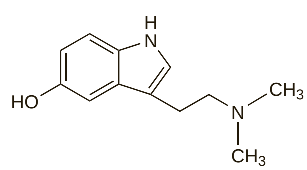
Bucladesine sodium has been reported to have cardiotonic properties when given intravenously. It has been applied topically for the treatment of bedsores.

Bufotenine

Bufotenin; Bufotenina; *NN*-Dimethylserotonin; 5-Hydroxy-*NN*-dimethyltryptamine; Mappine. 3-(2-Dimethylaminoethyl)indol-5-ol.

Буфотенин

$C_{12}H_{16}N_2O$ = 204.3.
CAS — 487-93-4.



Profile

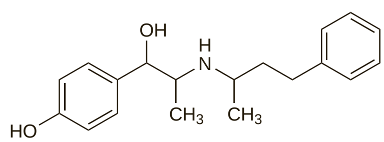
Bufotenine is an indole alkaloid obtained from the seeds and leaves of *Piptadenia peregrina*, from which the hallucinogenic snuff cohoba is prepared, and *P. macrocarpa* (Mimosaceae). It was first isolated from the skin glands of toads (*Bufo* spp.) and has also been isolated from species of *Amanita* (Agaricaceae). Bufotenine has serotonergic activity and is reported to have hallucinogenic properties. It has no therapeutic use.

Buphenine Hydrochloride *(BANM, rINNM)* ⊗

Buphénine, Chlorhydrate de; Buphenini Hydrochloridum; Hidrocloruro de bufenina; Nylidrin Hydrochloride; Nylidrinium Chloride. 1-(4-Hydroxyphenyl)-2-(1-methyl-3-phenylpropylamino)-propan-1-ol hydrochloride.

Буфенина Гидрохлорид

$C_{19}H_{25}NO_2,HCl$ = 335.9.
CAS — 447-41-6 (buphenine); 849-55-8 (buphenine hydrochloride).
ATC — C04AA02; G02CA02.
ATC Vet — QC04AA02; QG02CA02.



(buphenine)

Adverse Effects and Precautions

As for Sympathomimetics, p.1407; buphenine has mainly beta-agonist effects.

Uses and Administration

Buphenine produces peripheral vasodilatation through beta-adrenoceptor stimulation and a direct action on the arteries and arterioles of the skeletal muscles.

Buphenine has been used in the treatment of peripheral vascular and cerebrovascular disease. It has also been used in preparations for rhinitis and nasal congestion. Doses of buphenine hydrochloride in the range of 3 to 12 mg three or four times daily have been given orally.

An intravenous infusion of buphenine hydrochloride has been used to arrest premature labour. It has also been given orally as a prophylactic tocolytic agent.

Preparations

Proprietary Preparations (details are given in Part 3)
Austria: Dilatol; ***Canad.:*** Arlidin; ***India:*** Arlidin; ***Mex.:*** Arlidin; Nilken; ***Switz.:*** Tocodrine†.

Multi-ingredient: ***Austria:*** Arbid; Dilaescol; Dilatol-Chinin; Opino; Tropoderm; ***Fr.:*** Ophtadil†; Phlebogel; ***Ger.:*** Apoplectal N†; opino N spezial†; ***Gr.:*** Opino-jel; ***Indon.:*** Opino; ***Mex.:*** Flumil; ***Switz.:*** Arbid; Visaline.

Burnet

Garden Burnet; Greater Burnet; Pimpinela mayor; Sanguisorba.

NOTE. Distinguish from Burnet Saxifrage (below).

Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii).
Ph. Eur. 6.2 (Sanguisorba Root). The whole or fragmented, dried underground parts of *Sanguisorba officinalis* without rootlets. The adventitious roots are about 5 to 25 cm long and up to 2 cm in diameter. They contain a minimum 5.0% of tannins, expressed as pyrogallol ($C_6H_6O_3$ = 126.1) calculated with reference to the dried drug.

Profile

Burnet, the aerial parts and roots of *Sanguisorba officinalis* (*Poterium officinalis*) (Rosaceae), has antihaemorrhagic and astringent properties. It has been used internally to treat menorrhagia and gastrointestinal disorders and is also used topically for eczema, burns, and other skin disorders.

Burnet is also used as an animal fodder and salad vegetable, and as an ingredient in beer making.

Homoeopathy. Burnet has been used in homoeopathic medicines under the following names: Sanguisorba officinalis.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Canad.:*** Swiss Herb Cough Drops; ***Cz.:*** Tormentan; ***Indon.:*** Ambeven.

Burnet Saxifrage

Bibernell; Boucage; Pimpinella.

NOTE. Distinguish from Burnet (above).

Profile

The root of burnet saxifrage, *Pimpinella saxifraga* (Apiaceae), or greater burnet saxifrage, *P. major* is included in herbal preparations for coughs and minor upper respiratory-tract disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Expectosan Hierbas y Miel; ***Canad.:*** Original Herb Cough Drops; ***Cz.:*** Bronchicum Elixir†; Bronchicum Hustensirup†; ***Ger.:*** Bronchicum Elixir N†; Majocarmin forte†; ***Neth.:*** Bronchicum; ***Pol.:*** Bronchicum Eliksir; ***S.Afr.:*** Bronchicough†; Bronchicum†; ***Spain:*** Himelan†; Natusor Aerofane†; Natusor Astringel†; Regamint†; ***Switz.:*** Kernosan Elixir; Kernosan Heidelberger Poudre; Makaphyt Gouttes antitussives.

Butcher's Broom

Box Holly; Dygiųjų pelžiedžių šakniastiebiai; Kłącze ruszczyka; Listnatcový kořen; Petit houx; Rautamyrtinjuurakko; Rusci Radix; Rusci rhizoma; Stickmyrtenrot.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Butcher's Broom; Rusci Rhizoma). The dried, whole or fragmented underground parts of *Ruscus aculeatus*. It contains a minimum of 1.0% of total sapogenins, expressed as ruscogenins (mixture of neoruscogenin ($C_{27}H_{40}O_4$ = 428.6) and ruscogenin), calculated with reference to the dried drug. Protect from light.

Profile

The dried rhizome and root of butcher's broom is used in herbal preparations for chronic venous insufficiency and haemorrhoids. It contains steroidal saponins including the sapogenin ruscogenin (see p.2382) which is used for similar purposes. The dose may be expressed in terms of total ruscogenins.

Preparations

Proprietary Preparations (details are given in Part 3)

Chile: Venoserin; ***Ger.:*** Duoform Novo†; Fagorutin Ruscus; Phlebodril mono; Rhenus med†; Venelbin ruscus†; Venobiase mono†.

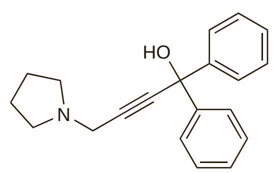
Butinoline Phosphate *(rINNM)*

Butinoline, Phosphate de; Butinolini Phosphas; Fosfato de butinolina. 1,1-Diphenyl-4-pyrrolidino-1′-yl but-2-yn-1-ol phosphate.

Бутинолина Фосфат

$C_{20}H_{21}NO,H_3PO_4$ = 389.4.

CAS — 968-63-8 (butinoline); 54118-66-0 (butinoline phosphate).



(butinoline)

Profile

Butinoline phosphate is used as an antispasmodic in preparations for gastrointestinal disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Spasmo-Solugastril; ***Ger.:*** Spasmo-Nervogastrol†; Spasmo-Solugastril†.

Butterbur

Profile

The leaves and roots of butterbur, *Petasites hybridus* (*P. officinalis*) (Asteraceae), have antispasmodic and anti-inflammatory properties and have been used in herbal preparations for a variety of disorders, including gastrointestinal and respiratory-tract disorders, and migraine.

Preparations

Proprietary Preparations (details are given in Part 3)

Ger.: Petadolex; Petaforce V; ***Switz.:*** DoloMed†; Petadolor†; Pollivita; Tesalin.

Multi-ingredient: ***Switz.:*** Dragees aux figues avec du sene; Dragees pour la detente nerveuse; Relaxane; Valverde Constipation dragees; Valverde Detente dragees; Wala Pulmonium suc contre la toux.

Butyl Nitrite

Nitrito de butilo.

$C_4H_9NO_2$ = 103.1.

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of butyl nitrite:

Bolt; Climax; Locker room; Poppers; Rush; Snappers; Video head cleaner.

Profile

Butyl nitrite is not used medicinally but, as with other volatile nitrites, is abused for its vasodilating and related effects following inhalation (see Abuse, under Amyl Nitrite, p.1437).

Cadmium

Cadmio; Kadm; Kadmium.

Cd = 112.411.

CAS — 7440-43-9.

Cadmium Sulfate

Cadmii sulfas; Cadmium, sulfate de; Kadmiumsulfaatti; Kadmiumsulfat; Kadmu siarczan.

$CdSO_4$ = 208.5.

CAS — 10124-36-4.

Pharmacopoeias. *Eur.* (see p.vii) includes a form for homoeopathic preparations.

Ph. Eur. 6.2 (Cadmium Sulphate Hydrate for Homoeopathic Preparations; Cadmii Sulfas Hydricus ad Praeparationes Homoeopathicas). A white or almost white, crystalline powder. Freely soluble in water; practically insoluble in alcohol.

Profile

Cadmium is used in a wide range of manufacturing processes and cadmium poisoning presents a recognised industrial hazard. Inhalation of cadmium fumes during welding procedures may not produce symptoms until 12 to 36 hours have passed and these symptoms include respiratory distress leading to pulmonary oedema; kidney toxicity is also a feature of acute cadmium poisoning. Ingestion of cadmium or its salts has the additional hazard of severe gastrointestinal effects. Cadmium has a long biological half-life and accumulates in body tissues, particularly the liver and kidneys. Chelation therapy is not generally recommended for cadmium poisoning, although sodium calcium edetate has been used after acute ingestion. However, chelators do not increase cadmium elimination in chronic poisoning and use of dimercaprol may increase cadmium toxicity and should be avoided. Chronic exposure to cadmium results in progressive renal impairment and other effects (see below).

Cadmium sulfide has been used topically in some countries for the treatment of skin and scalp conditions. Cadmium sulfate has been included in some preparations for the treatment of eye irritation.

Homoeopathy. Cadmium has been used in homoeopathic medicines under the following names: Cadmium metallicum; Cad. met.

Cadmium sulfate has been used in homoeopathic medicines under the following names: Cadmium sulfuricum; Cadmium sulphuricum; Cad. sul.

Cadmium sulphide has been used in homoeopathic medicines under the following names: Cadmium sulphuratum; Cad. sulph.

Adverse effects. The toxicity of cadmium has been reviewed.[1] Environmental or occupational exposure to cadmium has been associated with renal dysfunction,[2-5] although this may be reversible if exposure is reduced.[6] A reduction in bone density may also occur.[7] Fatalities due to industrial exposure or self-poisoning have also been reported.[8,9] No effect on testicular endocrine function was observed in 77 industrial workers exposed to cadmium.[3]

An increased incidence of cancer of the prostate has been reported in subjects exposed to high levels of cadmium but the evidence is not conclusive.[10] There may be an association between cadmium exposure and lung cancer, although observations on this type of cancer are difficult to interpret because of exposure to other hazards such as smoking.

Preparations

Proprietary Preparations (details are given in Part 3)

Spain: Biocadmio.

Cajuput Oil

Cajeput Oil; Cajuput Essence; Cayeput, aceite esencial de; Oleum Cajuputi.

Profile

Cajuput oil is a volatile oil obtained by distillation from the fresh leaves and twigs of *Melaleuca cajuputi* (*M. leucadendron*) (Myrtaceae). It contains cineole. Cajuput oil has been applied externally as a stimulant and mild rubefacient in rheumatism. It is also used with other volatile agents in preparations for the relief of respiratory-tract disorders and nasal congestion. It is also used in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Goanna Heat Cream; Methyl Salicylate Ointment Compound†; Tiger Balm Red; Tiger Balm White; ***Austria:*** Tiger Balsam Rot; ***Belg.:*** Olbas; ***Canad.:*** Tiger Balm Red; Tiger Balm Ultra; Tiger Balm White; Youngflex Massage 168; ***Cz.:*** Tiger Balm Rot†; ***Fr.:*** Phytolithe†; Vegebom; ***Ger.:*** Liniplant; Nasenbalsam; Olbas; Palatol†; ***Gr.:*** Tiger Balm; ***Hong Kong:*** Vida Salirub; ***India:*** Flexi-muv; ***Indon.:*** Balsam Sakti; Minyak Telon; Minyak Telon Cap Tiga Anak; ***Israel:*** Tiger Balm Red; Tiger Balm White; ***Ital.:*** Otosan Natural Ear Drops†; ***Philipp.:*** Begesic; ***Pol.:*** Argol Rheuma; Olbas; ***S.Afr.:*** Muscle Rub; ***Singapore:*** Begesic; ***Switz.:*** Frigoplasma†; Novital; Olbas; Wala Baume nasal; ***Thai.:*** Dexalin; Hot Ize; Olympic Balm†; ***UK:*** Bells Muscle Rub; Olbas; Olbas for Children; Soothol; Tiger Balm; Vadarex.

Calamus

Acore Vrai; Cálamo aromático; Calamus Rhizome; Kalmus; Sweet Flag Root.

CAS — 8015-79-0 (calamus oil).

Pharmacopoeias. In *Chin.* and *Swiss.*

Profile

Calamus, the dried rhizome of the sweet flag, *Acorus calamus* (Acoraceae), has been used as a bitter and carminative; it is also used as a source of calamus oil, which is employed in perfumery. The FDA in the USA has prohibited marketing calamus as a food or food additive; the oil (Jammu variety) is reported to be a carcinogen.

Homoeopathy. Calamus has been used in homoeopathic medicines under the following names: Calamus aromaticus; Acorus calamus.

Preparations

Proprietary Preparations (details are given in Part 3)

Cz.: Koren Puskvorce.

Multi-ingredient: ***Austria:*** Abdomilon N; ***Cz.:*** Abdomilon†; Dr Theiss Schwedenbitter; Eugastrin†; Original Schwedenbitter; Stomaran; ***Fr.:*** Jouvence de l'Abbe Soury; ***Ger.:*** Abdomilon N; Gastrol S†; Majocarmin mite†; Presselin Blahungs K 4 N†; Stomasal Med†; Stovalid N†; ventri-loges N; ***Israel:*** Rekiv; ***Ital.:*** Frerichs Maldifassi†; ***Pol.:*** Dentosept A; Gastro; Krople Zoladkowe; Seboren; ***Port.:*** Cholagutt†; ***Rus.:*** Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера); ***Switz.:*** Kernosan Elixir; Tisane pour l'estomac; Urinex; ***UK:*** Pegina.

Calcium Carbimide *(rINN)*

Calcii Carbimidum; Calcium Cyanamide; Carbimida cálcica; Carbimide Calcique; Cyanamide.

Кальция Карбимид

$CCaN_2$ = 80.1.

CAS — 156-62-7 (calcium carbimide); 8013-88-5 (citrated calcium carbimide).

ATC — N07BB02.

ATC Vet — QN07BB02; QV03AA02.

N≡—N=Ca

NOTE. The name cyanamide is also used to designate carbimide, which is used in veterinary medicine.

Adverse Effects and Precautions

Calcium carbimide may cause drowsiness, dizziness, fatigue, skin rash, tinnitus, depression, impotence, and urinary frequency. There may be a reversible increase in the white cell count. It should be used with caution in patients with asthma, coronary artery disease, or myocardial disease. Calcium carbimide causes a reaction in patients who have consumed alcohol similar to that seen with disulfiram (see p.2296).

Effects on the heart. Hypotension and tachycardia were reported during the carbimide-alcohol reaction.[1]

1. Peachey JE, *et al.* Cardiovascular changes during the calcium carbimide-ethanol interaction. *Clin Pharmacol Ther* 1981; **29:** 40–6.

Effects on the liver. Reports[1,2] of hepatic lesions in patients receiving calcium carbimide.

1. Vázquez JJ, Cervera S. Cyanamide-induced liver injury in alcoholics. *Lancet* 1980; **i:** 361–2.
2. Moreno A, *et al.* Structural hepatic changes associated with cyanamide treatment: cholangiolar proliferation, fibrosis and cirrhosis. *Liver* 1984; **4:** 15–21.

Uses and Administration

Calcium carbimide has actions and uses similar to those of disulfiram (p.2297). It is an aversive agent used as an adjunct in the treatment of chronic alcoholism (see Alcohol Withdrawal and Abstinence, p.1626). It is given in a dose of up to 60 mg twice daily by mouth. Citrated calcium carbimide has been used similarly.

◊ References.

Austria: Colme; ***Rus.:*** Colme (Колме); ***Spain:*** Colme.

Calcium Dihydrogen Phosphate

Acid Calcium Phosphate; Calcium Dihydrogenphosphoricum; E341; Fosfato monocálcico; Monobasic Calcium Phosphate; Monocalcium Phosphate. Calcium tetrahydrogen diorthophosphate monohydrate.

$Ca(H_2PO_4)_2,H_2O = 252.1.$
CAS — 7758-23-8 (anhydrous calcium dihydrogen phosphate).

Pharmacopoeias. In *Jpn* and *Swiss*.

Profile

Calcium dihydrogen phosphate is used in fertilisers. It is also used as an antoxidant in baking powders and flours and as a source of calcium in some mineral supplement preparations.

Preparations

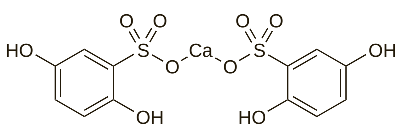
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Fr.:*** Phosphoneuros.

Calcium Dobesilate *(rINN)*

Calcii dobesilas; Calcium, dobésilate de; Calcium Doxybenzylate; CLS-2210; Dobesilan vápenatý; Dobésilate de Calcium; Dobesilato de calcio; 205E; Kalcio dobesilatas; Kalciumdobesilat; Kalcium-dobezilát; Kalsiumdobesilaatti; Kalsiyum Dobesilat. Calcium 2,5-dihydroxybenzenesulphonate.

Кальция Добезилат

$C_{12}H_{10}CaO_{10}S_2 = 418.4.$
CAS — 88-46-0 (dobesilic acid); 20123-80-2 (calcium dobesilate).
ATC — C05BX01.
ATC Vet — QC05BX01.



Pharmacopoeias. In *Eur.* (see p.vii) which specifies the monohydrate.

Ph. Eur. 6.2 (Calcium Dobesilate Monohydrate). A white or almost white hygroscopic powder. Very soluble in water; freely soluble in dehydrated alcohol; practically insoluble in dichloromethane; very slightly soluble in isopropyl alcohol. A 10% solution in water has a pH of 4.5 to 6.0. Store in airtight containers. Protect from light.

Profile

Calcium dobesilate is claimed to reduce capillary permeability and has been used in various peripheral circulatory disorders including diabetic retinopathy and haemorrhoids (p.1697). Gastrointestinal disturbances have occurred with its use, and there are also reports of hypersensitivity reactions.

Calcium dobesilate is given orally in usual doses of 0.5 to 1.5 g daily in divided doses. It is also given rectally for haemorrhoids and is an ingredient of some preparations given for various skin disorders.

◊ Reviews.

1. Tejerina T, Ruiz E. Calcium dobesilate: pharmacology and future approaches. *Gen Pharmacol* 1998; **31:** 357–60.
2. Berthet P, *et al.* Calcium dobesilate: pharmacological profile related to its use in diabetic retinopathy. *Int J Clin Pract* 1999; **53:** 631–6.

Adverse effects. Agranulocytosis has been reported[1-3] in a few patients after treatment with calcium dobesilate, and in 2 cases recurred on rechallenge.[1,2] However, a later review[4] of the safety profile of calcium dobesilate concluded that the overall risk of adverse effects was low with the most prominent symptoms being fever, arthralgias, and gastrointestinal disturbances. Reports of agranulocytosis were rare and the authors concluded that there may have been methodological bias in previous assessments of risk.

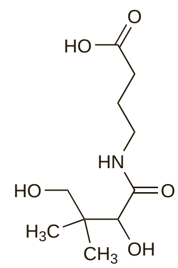
Calcium Hopantenate *(rINNM)*

Calcii Hopantenas; Calcium Homopantothenate; Hopanténate de Calcium; Hopantenato cálcico. Calcium D-(+)-4-(2,4-dihydroxy-3,3-dimethylbutyramido)butyrate hemihydrate.

Кальций Гопантенат

$Ca(C_{10}H_{18}NO_5)_2,\frac{1}{2}H_2O = 513.6.$
CAS — 18679-90-8 (hopantenic acid); 17097-76-6 (anhydrous calcium hopantenate); 1990-07-4 (calcium hopantenate hemihydrate).



(hopantenic acid)

Profile

Calcium hopantenate is a homologue of pantothenic acid (p.1959) and has been tried in the treatment of various behavioural and extrapyramidal disorders. Its use is limited by severe metabolic adverse effects and fatalities have been reported.

Preparations

Proprietary Preparations (details are given in Part 3)
Rus.: Pantocalcin (Пантокальцин); Pantogam (Пантогам); Pantohamum (Пантогам)†.

Calcium Hydroxide

Calcii hydroxidum; Calcium Hydrate; Calcium, hydroxyde de; E526; Hidróxido cálcico; Hydroxid vápenatý; Kalcio hidroksidas; Kalcium-hidroxid; Kalciumhydroxid; Kalsiumhydroksidi; Slaked Lime; Wapnia wodorotlenek.

$Ca(OH)_2 = 74.09.$
CAS — 1305-62-0.

Pharmacopoeias. In *Eur.* (see p.vii), *Jpn, US,* and *Viet.*

Ph. Eur. 6.2 (Calcium Hydroxide). A fine white or almost white powder. Practically insoluble in water.

USP 31 (Calcium Hydroxide). A white powder with a slightly bitter alkaline taste. Soluble 1 in 630 of water and 1 in 1300 of boiling water; insoluble in alcohol; soluble in glycerol and in syrup. Store in airtight containers.

Profile

Calcium hydroxide is a weak alkali. It is used in the form of Calcium Hydroxide Solution (lime water) in some skin lotions and oily preparations to form calcium soaps of fatty acids which produce water-in-oil emulsions.

Calcium hydroxide pastes are used in dentistry. A paste made from a mixture of calcium hydroxide and potassium hydroxide and known as Vienna paste was used as an escharotic. Soda lime (p.2388) is a mixture of calcium hydroxide and potassium hydroxide and/or sodium hydroxide. With sulfur, calcium hydroxide forms sulfurated lime solution (p.1614).

Homoeopathy. Calcium hydroxide has been used in homoeopathic medicines under the following names: Calcarea caustica; Cal. caus.

Adverse effects. A report of ocular alkali burns in children, leading to severe visual loss, caused by packets of calcium hydroxide ('Chuna') popularly consumed in India as an additive to chewing tobacco.[1]

For the use of sodium edetate in the treatment of calcium hydroxide burns of the eye, see p.1464.

1. Agarwal T, Vajpayee RB. A warning about the dangers of chuna packets. *Lancet* 2003; **361:** 2247.

Preparations

BP 2008: Calcium Hydroxide Solution;
USP 31: Calcium Hydroxide Topical Solution.

Proprietary Preparations (details are given in Part 3)
Ger.: Dermi-cyl; ***Mex.:*** Oleoderm.

Multi-ingredient: ***Cz.:*** Aviril H†; ***Mex.:*** Caliderm; Liniderm; Oleoderm Plus; ***Pol.:*** Acne Sulf; ***Spain:*** Cremsol; ***Switz.:*** Sansilla.

Calcium Oxide

Calcii Oxidum; Calcium Oxydatum; Calcium, oxyde de; Calx; Calx Usta; Chaux Vive; E529; Gebrannter Kalk; Lime; Oxid vápenatý; Óxido de calcio; Quicklime; Wapnia tlenek; Wapnia tlenek.

$CaO = 56.08.$
CAS — 1305-78-8.
ATC Vet — QP53AX18.

Pharmacopoeias. In *Jpn, Pol.,* and *US.*

USP 31 (Lime). Hard, odourless, white or greyish-white masses, granules, or powder. When it is moistened with water a reaction occurs, heat being evolved and calcium hydroxide formed. Slightly soluble in water; very slightly soluble in boiling water. Store in airtight containers.

Adverse Effects and Treatment

Calcium oxide may cause burns on contact with moist skin and mucous membranes; it is particularly irritant to the eyes. Washing or flooding of affected areas may need to be prolonged. Pneumonitis may follow inhalation.

◊ For the use of sodium edetate in the treatment of calcium oxide burns of the eye, see p.1464.

Uses and Administration

Calcium oxide has been used in various dermatological preparations. A paste made from a mixture of calcium oxide and sodium hydroxide and known as London paste was used as an escharotic.

Preparations

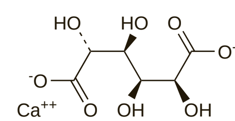
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Ital.:*** Oleo Calcarea†.

Calcium Saccharate *(rINN)*

Calcii Saccharas; Calcium D-Saccharate; Sacarato cálcico; Sacarato de calcio; Saccharate de Calcium; Sucrate de Calcium. Calcium D-glucarate tetrahydrate.

Кальция Сахарат

$C_6H_8CaO_8,4H_2O = 320.3.$
CAS — 5793-88-4 (anhydrous calcium saccharate); 5793-89-5 (calcium saccharate tetrahydrate).



NOTE. The names calcium saccharate and calcium sucrate have also been used to describe saccharated lime.

Pharmacopoeias. In *US.*

USP 31 (Calcium Saccharate). A white, odourless, crystalline powder. Very slightly soluble in cold water and in alcohol; slightly soluble in boiling water; practically insoluble in chloroform and in ether; soluble in dilute mineral acids and in solutions of calcium gluconate.

Profile

Calcium saccharate is used as a stabilising agent in solutions of calcium gluconate for injection. Each g of calcium saccharate contains about 3.1 mmol of calcium. Calcium saccharate 8 g is equivalent to about 1 g of calcium.

Preparations

Proprietary Preparations (details are given in Part 3)
Austria: Calcium Fresenius; ***Ger.:*** Calcium Fresenius†.

Multi-ingredient: ***Ger.:*** Calcium Braun; ***Switz.:*** C-Calcium; Glucocalcium.

Calcium Sulfate

Calcii sulfas; Calcium, sulfate de; Calcium Sulphate; E516; Gypsum (calcium sulfate dihydrate); Kalcio sulfatas; Kalciumsulfat; Kalcium-szulfát; Kalsiumsulfaatti; Síran vápenatý; Sulfato cálcico; Wapnia siarczan.

$CaSO_4 = 136.1.$
CAS — 7778-18-9 (anhydrous calcium sulfate); 10101-41-4 (calcium sulfate dihydrate).

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Int.,* and *Jpn* which specify the dihydrate. Also in *USNF* which specifies the dihydrate or the anhydrous material.

Ph. Eur. 6.2 (Calcium Sulphate Dihydrate). A white or almost white fine powder. Very slightly soluble in water; practically

insoluble in alcohol.
USNF 26 (Calcium Sulfate). It is anhydrous or contains two molecules of water of hydration. A white to slightly yellow-white odourless fine powder. Soluble 1 in 375 of water and 1 in 485 of boiling water; soluble in 3N hydrochloric acid.

Profile
Calcium sulfate dihydrate is used as an excipient for the preparation of tablets or capsules.

Homoeopathy. Calcium sulfate has been used in homoeopathic medicines under the following names: Calcium sulfuricum; Calcarea sulphurica; Cal. sul.

Preparations
Proprietary Preparations (details are given in Part 3)
Austral.: Celloids CS 36.

Dried Calcium Sulfate
Calcii Sulfas Hemihydricus; Calcined Gypsum; Calcium Sulfuricum ad Usum Chirurgicum; Calcium Sulphuricum Ustum; Dried Calcium Sulphate; Exsiccated Calcium Sulphate; Gebrannter Gips; Gêsso; Gypsum Siccatum; Plaster of Paris; Plâtre Cuit; Síran vápenatý hemihydrát; Sulfato cálcico anhidro; Sulphate of Lime; Yeso Blanco.

$CaSO_4, \frac{1}{2}H_2O$ = 145.1.
CAS — 10034-76-1 (calcium sulfate hemihydrate); 26499-65-0 (calcium sulfate hemihydrate).

Pharmacopoeias. In *Br., Chin., Ger., Jpn, Pol.,* and *Viet.*
BP 2008 (Dried Calcium Sulphate). A white or almost white, odourless or almost odourless hygroscopic powder. It may contain suitable setting accelerators or decelerators. Slightly soluble in water; more soluble in dilute mineral acids; practically insoluble in alcohol.
The BP gives Exsiccated Calcium Sulphate and Plaster of Paris as approved synonyms.

Profile
Dried calcium sulfate is used for the preparation of Plaster of Paris Bandage, which is used for the immobilisation of limbs and fractures. It is also employed for making dental casts and has been used as a bone graft substitute.

Preparations
Proprietary Preparations (details are given in Part 3)
Fr.: Biplatrix.

Calendula
Caléndula; Calendulae Anthodium; Calendulae flos; Gold-bloom; Kehäkukka; Körömvirág; Koszyczek nagietka; Marigold; Marybud; Medetkų žiedai; Měsíčkový květ; Pot Marigold; Ringblomma; Souci.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Calendula Flower). It consists of the whole or cut, dried, and fully opened flowers which have been detached from the receptacle of the cultivated, double-flowered varieties of *Calendula officinalis*. It contains not less than 0.4% of flavonoids, calculated as hyperoside ($C_{21}H_{20}O_{12}$ = 464.4) calculated with reference to the dried drug. Protect from light.

Profile
Calendula has antiseptic, anti-inflammatory, and astringent properties. It is used in external preparations for minor skin disorders, and also internally for gastrointestinal and menstrual disorders. Calendula is also included in numerous herbal preparations to improve their appearance.
Calendula oil is also used.

Homoeopathy. Calendula has been used in homoeopathic medicines under the following names: Calendula officinalis; Calend.

Preparations
Proprietary Preparations (details are given in Part 3)

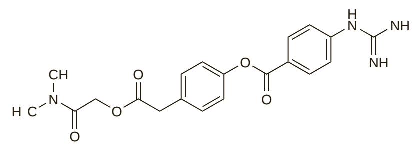
Calumba
Calumba Root; Colombo.

Pharmacopoeias. In *Jpn.*

Profile
Calumba, the dried root of *Jateorhiza palmata* (*J. columba*) (Menispermaceae), has been used as a bitter and as a flavour.

Preparations
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Switz.:*** Padma-Lax; Padmed Laxan; ***UK:*** Appetiser Mixture; Pegina.

Camostat Mesilate *(pINNM)*
Camostat, Mésilate de; Camostat Mesylate; Camostati Mesilas; FOY-305; Mesilato de camostat. *N,N*-Dimethylcarbamoylmethyl 4-(4-guanidinobenzoyloxy)phenylacetate methanesulphonate.
Камостата Мезилат
$C_{20}H_{22}N_4O_5,CH_4O_3S$ = 494.5.
CAS — 59721-28-7 (camostat); 59721-29-8 (camostat mesilate).
ATC — B02AB04.
ATC Vet — QB02AB04.



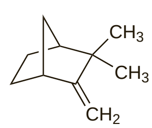
(camostat)

Pharmacopoeias. In *Jpn.*

Profile
Camostat mesilate is a proteolytic enzyme inhibitor that has been given orally for the treatment of postoperative reflux oesophagitis (p.1696) in a dose of 100 mg 3 times daily, and for remission of the acute symptoms of chronic pancreatitis (p.2361) in a dose of 200 mg 3 times daily.

Preparations
Proprietary Preparations (details are given in Part 3)
Jpn: Foipan.

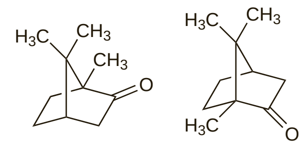
Camphene
Kamfen. 2,2-Dimethyl-3-methylenebicyclo[2.2.1]heptane; .
Камфен
$C_{10}H_{16}$ = 136.2.
CAS — 79-92-5;.



Profile
Camphene is a constituent of several essential oils. It has antiseptic and antispasmodic actions and is included in preparations for the treatment of biliary- and urinary-tract disorders.

Preparations
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Austria:*** Rowachol; Rowatinex; ***Braz.:*** Quelodin†; ***Chile:*** Rowatinex; ***Cz.:*** Rowachol; Rowatinex; ***Ger.:*** Rowachol; Rowachol comp†; Rowachol-Digestiv; Rowatinex; ***Hong Kong:*** Neo-Rowachol; Neo-Rowatinex; Rowachol; Rowatinex; ***Hung.:*** Rowachol; Rowatinex; ***Irl.:*** Rowachol; Rowatinex; ***Israel:*** Rowachol; Rowatinex; ***Malaysia:*** Rowachol; Rowatinex; ***Mex.:*** Cholex; ***Philipp.:*** Rowachol; Rowatinex; ***Pol.:*** Rowachol; Rowatinex; Terpichol; ***Spain:*** Rowachol; Rowanefrin; ***Switz.:*** Rowachol; ***Thai.:*** Rowachol; Rowatinex; ***UK:*** Rowachol; ***Venez.:*** Rowachol; Rowatinex.

Camphor
Alcanfor; 2-Camphanone; D-Camphor (natural); Camphora; Camphora D; Camphre; Camphre Droit (natural); Camphre du Japon (natural); Cânfora; D-Kafr; Kafr; Kamfer; Kamferi; Kámfor; Kamfora; Kamparas. Bornan-2-one; 1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one.
$C_{10}H_{16}O$ = 152.2.
CAS — 76-22-2 (± camphor); 21368-68-3 (± camphor); 464-49-3 (+ camphor); 464-48-2 (− camphor).
ATC — C01EB02.
ATC Vet — QC01EB02.



l-form d-form

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Jpn, US,* and *Viet.*; some only describe natural camphor and some only synthetic camphor; *Eur.* and *Jpn* have separate monographs for natural and racemic or synthetic camphor.
Ph. Eur. 6.2 (Camphor, Racemic). A white or almost white, crystalline powder or friable crystalline masses, highly volatile even at room temperature. Slightly soluble in water; very soluble in alcohol and in petroleum spirit; very slightly soluble in glycerol; freely soluble in fatty oils.
Ph. Eur. 6.2 (D-Camphor; Natural Camphor BP 2008). A white or almost white, crystalline powder or friable crystalline masses, highly volatile even at room temperature. Slightly soluble in water; very soluble in alcohol and in petroleum spirit; very slightly soluble in glycerol; freely soluble in fatty oils.
USP 31 (Camphor). A ketone obtained from *Cinnamomum camphora* (Lauraceae) or produced synthetically. The natural product is dextrorotatory and the synthetic product is optically inactive.
Colourless or white crystals, granules, or crystalline masses, or colourless to white, translucent, tough masses with a penetrating characteristic odour. It slowly volatilises at ordinary temperatures.
Soluble 1 in 800 of water, 1 in 1 of alcohol, 1 in 0.5 of chloroform, and 1 in 1 of ether; freely soluble in carbon disulfide, in petroleum spirit, and in fixed and volatile oils. Store at a temperature not exceeding 40° in airtight containers.

Compounding. A liquid or soft mass is formed when camphor is triturated with cloral hydrate, menthol, phenol, and many other substances. Camphor is readily powdered by triturating with a few drops of alcohol, ether, or chloroform.

Adverse Effects
In addition to accidental ingestion of preparations containing camphor, poisoning has also occurred after giving camphorated oil (camphor liniment) to children in mistake for castor oil. The symptoms include nausea, vomiting, epigastric pain, headache, dizziness, oropharyngeal burning, delirium, muscle twitching, epileptiform convulsions, depression of the CNS, and coma. Breathing is difficult and the breath has a characteristic odour; anuria may occur. Death from respiratory failure or status epilepticus may occur; fatalities in children have been recorded from 1 g. There have been reports of instant collapse in infants following the local application of camphor to their nostrils.

Treatment of Adverse Effects
Supportive care, including anticonvulsant therapy, is the mainstay of treatment of camphor intoxication. Gastric lavage may be considered if the patient presents within 1 hour of ingestion; any convulsions must be controlled first. Activated charcoal may be given orally. Haemodialysis with a lipid dialysate or haemoperfusion have been tried but are of doubtful value.

Precautions
Camphor should not be applied to the nostrils of infants even in small quantities, as this may cause immediate collapse.

◊ The UK Committee on the Review of Medicines[1] recommended that camphor should not be included in products intended for the treatment of hepatic and biliary disorders, gallstones, colic, renal disorders, urinary-tract infections, or ureteral stones. The use of camphor parenterally or as irrigants was considered undesirable due to the associated safety hazard.

1. Anonymous. Camphorated oil: licensing authority takes action on camphor products. *Pharm J* 1984; **232:** 792.

Pharmacokinetics
Camphor is readily absorbed from all administration sites. It is hydroxylated in the liver to yield hydroxycamphor metabolites which are then conjugated with glucuronic acid and excreted in the urine. Camphor crosses the placenta.

◊ For reference to a study on the dermal absorption of camphor, menthol, and methyl salicylate, see Menthol, p.2340.

Uses and Administration
Applied externally, camphor acts as a rubefacient and mild analgesic (see p.5) and is used in liniments as a counter-irritant in fibrositis, neuralgia, and similar conditions. It is also an ingredient of many inhaled nasal decongestant preparations but it is of doubtful efficacy. The use of camphor liniment (camphorated oil) is discouraged because of its potential toxicity. It has been withdrawn from the market in both the UK and the USA. In the USA the concentration of camphor in preparations for external use may not exceed 11%.

Camphor oil is occasionally used in aromatherapy.

Taken internally camphor has irritant and carminative properties and has been used as a mild expectorant. It has also been used in mixed preparations for cardiovascular disorders.

Preparations

BP 2008: Camphorated Opium Tincture; Concentrated Camphor Water; Concentrated Camphorated Opium Tincture;
USP 31: Camphor Spirit; Camphorated Phenol Topical Gel; Flexible Collodion.

Proprietary Preparations (details are given in Part 3)
Canad.: Band-Aid Anti-Itch; ***Fr.:*** Camphrice Du Canada; ***Ger.:*** Camphoderm N; Caprisana†; Mulmicor; Pectocor N; Rheunervol N; Vaopin N; ***Pol.:*** Migrenol; ***Port.:*** Vicks Vaporub; ***Switz.:*** Nicobrevin N†; ***UK:*** Rohto Zi.

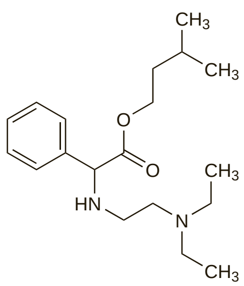
$C_{19}H_{32}N_2O_2,2HCl = 393.4.$
CAS — 54-30-8 (camylofin); 5892-41-1 (camylofin hydrochloride).
ATC — A03AA03.
ATC Vet — QA03AA03.



(camylofin)

Profile

Camylofin is used as an antispasmodic, usually in combination preparations. It is usually used as the hydrochloride; the noramidopyrine mesilate and the sodium salts have also been used.

Overdosage. Ingestion of large doses of camylofin by 2 infants produced symptoms similar to those of opioid intoxication.[1] Both infants responded to treatment with naloxone.

1. Schvartsman S, *et al.* Camylofin intoxication reversed by naloxone. *Lancet* 1988; **ii:** 1246.

Preparations

Cannabidiol ⊗

CBD. (3*R*, 4*R*)-2-*p*-Mentha-1,8-dien-3-yl-5-pentylresorcinol.
$C_{21}H_{30}O_2 = 314.5.$
CAS — 13956-29-1.

Profile

Cannabidiol is a cannabinoid present in cannabis (p.2274) that is being used or under investigation for a number of potential therapeutic uses, including in combination with Δ^9-tetrahydrocannabinol (dronabinol, p.1728) in a buccal spray preparation (see under Cannabis, below).

◊ For references to the potential uses of cannabidiol, see under Cannabis, p.2275.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Canad.:*** Sativex.

Cannabis ⊗

Cáñamo Indiano; Cannab.; Cannabis Indica; Chanvre; Hanfkraut; Indian Hemp.
CAS — 8063-14-7.

Description. Cannabis consists of the dried flowering or fruiting tops of the pistillate plant of *Cannabis sativa* (Cannabinaceae). In the UK cannabis is defined by law as any part of any plant of the genus *Cannabis*. *Marihuana* usually refers to a mixture of the leaves and flowering tops. *Bhang*, *dagga*, *ganja*, *kif*, and *maconha* are commonly used in various countries to describe similar preparations. *Hashish* and *charas* are names often applied to the resin, although in some countries *hashish* is applied to any cannabis preparation.

A series of cannabinoids has been extracted from the plant, the most important being Δ^9-tetrahydrocannabinol (dronabinol), Δ^8-tetrahydrocannabinol, Δ^9-tetrahydrocannabinolic acid, cannabinol, and cannabidiol.

Cannabis and cannabis preparations have also been known by the following names, many of which are 'street names' (see p.vi) or slang names:

Dependence

Prolonged heavy use of cannabis may lead to tolerance and psychological dependence but the existence of physical dependence remains somewhat controversial. Reported withdrawal symptoms have included anorexia, agitation, apprehension, aggression, anxiety, insomnia, irritability, restlessness, fever, sweating, tremor, dysphoria, rhinorrhoea, headache, and nausea.

Symptoms of withdrawal have been reported in neonates born to mothers who used cannabis during pregnancy, and have included jitteriness and tremulousness, crying, and disturbances in sleep and response to light occurring up to 30 days after birth.

Adverse Effects, Treatment, and Precautions

Cannabis is widely abused for its psychological effects and the most important psychoactive cannabinoid is Δ^9-tetrahydrocannabinol. The toxicity of cannabis is dose-related and when used recreationally depends to a large extent on the experience of the user and degree of tolerance. The effects may also be affected by CNS depressants taken at the same time.

The psychological effects produced by low doses of cannabis include calmness, euphoria, relaxation, drowsiness, a feeling of well-being, heightened sensory awareness, and alterations in perception of time, space, colour, or sound. Sedation may occur some time later after the initial effects. Anxiety or panic reactions may also occur at low doses.

As the level of intoxication increases, the user may experience feelings of depersonalisation, disorientation, decreased inhibition, altered mood, memory impairment, and difficulty in maintaining attention. Symptoms of heavy intoxication include incoordination, ataxia, skeletal muscle jerks, and slurred speech. Distrust, dysphoria, poor concentration, slowed reaction times, lethargy, and sedation may also occur. Fear, panic attacks in apprehensive patients, hallucinations, and transient paranoia or psychosis have also been reported.

Cannabis additionally affects several physiological body systems and symptoms of intoxication include tachycardia, palpitations, paroxysmal atrial fibrillation, and orthostatic hypotension; life-threatening ventricular tachycardia may occur after large doses. Decrease in intra-ocular pressure, conjunctival injection, cough, dry mouth, increased appetite, and reduced bowel motility have also been reported.

The toxicity of cannabis is increased with intravenous use. Gastrointestinal disturbances have been reported including nausea and vomiting, abdominal pain, and diarrhoea. Other symptoms include headache, rigors, fever, dyspnoea, cardiovascular irregularities, jaundice, shock, disseminated intravascular coagulation, renal impairment, and death.

Ingestion of cannabis by children is potentially fatal. Mydriasis, hypotonia, hyporeflexia, ataxia, hypothermia, tachycardia, respiratory depression, drowsiness, stupor, and coma have been reported.

Chronic use of cannabis has been reported to reduce resistance to infection, produce persistent neurotoxicity, and the carcinogens present in cannabis smoke potentially increase the risk of cancer. However, there is little conclusive evidence for the long-term effects of cannabis.

Cannabis has been presumed to affect driving because of slowed reaction times, effects on cognition, and perceptual alterations, although there is no conclusive evidence to this effect, and it has not been possible to correlate cannabis blood concentration with specific levels of impaired driving performance.

The risks of gastrointestinal decontamination following ingestion of cannabis may outweigh the benefits if the patient is drowsy or agitated. However, activated charcoal has been recommended within one hour of ingestion of a potentially toxic dose. Ipecacuanha given within 30 to 90 minutes of ingestion has been used as an alternative. Treatment of an overdose or acute toxicity following ingestion or inhalation of cannabis products is symptomatic and supportive. Adults often require little more than reassurance as clinical toxicity is rarely serious and recovery usually occurs spontaneously within several hours. Patients should be monitored for 6 hours after intravenous injection of cannabis products. Children should also be observed for 6 hours after ingestion. Agitated patients may require sedation with diazepam; lorazepam or midazolam have also been used. Haloperidol or ziprasidone are alternatives to benzodiazepines.

Breast feeding. The American Academy of Pediatrics deprecates[1] the use of cannabis as a drug of abuse by breast-feeding mothers; a published report[2] indicated that cannabinoids were secreted into breast milk and absorbed by nursing infants, and while no adverse effect was reported to have occurred, some components do have a very long half-life.

Interactions

Cannabis and alcohol have additive effects. The sedative effects of cannabis may be potentiated by other CNS depressants. Additive antimuscarinic effects, for example tachycardia, may occur with drugs such as tricyclic antidepressants. Cannabis induces microsomal enzymes and therefore interactions with a wide range of drugs that are metabolised by these enzymes might be expected (see, for example, Theophylline, p.1144).

Disulfiram. Limited evidence indicates that use of disulfiram with cannabis may produce a hypomanic state.[1]

1. Lacoursiere RB, Swatek R. Adverse interaction between disulfiram and marijuana: a case report. *Am J Psychiatry* 1983; **140:** 243–4.

Pharmacokinetics

Time to onset and duration of effects of cannabis vary with factors such as route of administration and the user's experience. The active principles of cannabis are readily absorbed from the lungs. Systemic bioavailability of Δ^9-tetrahydrocannabinol from smoked cannabis generally ranges between about 10 and 35%, with regular users achieving a higher efficiency. This produces an effect within minutes, reaches a peak in about 30 minutes, and lasts for about 3 to 4 hours. The pharmacokinetics of cannabis following injection are similar to smoking.

Δ^9-Tetrahydrocannabinol absorption may be slow and erratic from the gastrointestinal tract, and extensive first-pass liver metabolism reduces the systemic bioavailability to less than 20% with high interindividual variation. Effects peak in about 1 to 4 hours and last for up to 6 hours.

Δ^9-Tetrahydrocannabinol is lipophilic and becomes widely distributed in the body. Plasma protein binding is about 97 to 99%. Δ^9-Tetrahydrocannabinol is extensively metabolised in the liver via the cytochrome P450 isoenzyme CYP2C subfamily, primarily to the active 11-hydroxy derivative.

Within 72 hours of an oral dose, 10 to 15% is excreted in the urine mainly as conjugates and metabolites, and 35 to 50% in faeces mainly as unconjugated metabolites. About 80 to 90% of a dose is excreted within 5 days after ingestion. Duration of detectability of urinary metabolites varies greatly and can be several weeks for heavy chronic users.

Cannabis crosses the placenta and is distributed into breast milk.

◊ Review.

1. Grotenhermen F. Pharmacokinetics and pharmacodynamics of cannabinoids. *Clin Pharmacokinet* 2003; **42:** 327–60.

Uses and Administration

Cannabis contains about 60 cannabinoids of which the main active constituent is Δ^9-tetrahydrocannabinol. Two types of specific endogenous cannabinoid-binding receptors have been identified. CB_1 receptors are distributed throughout the CNS and some peripheral tissues and are involved in modulation of a number of neurotransmitters, which is thought to be responsible for the clinical effects of cannabinoids. CB_2 receptors are expressed mainly in immune cells and are thought to be involved in modulation of the immune system. Cannabinoid receptor agonists and antagonists have also been identified.

Therapeutic use. Cannabis was formerly used therapeutically as a sedative or narcotic. The cannabinoid Δ^9-tetrahydrocannabinol (dronabinol, p.1728) and a synthetic cannabinol (nabilone, p.1750) are used as antiemetics in patients receiving cancer chemotherapy. Dronabinol is also used to stimulate appetite in HIV patients with cachexia. Dronabinol and cannabidiol (p.2274), another cannabinoid, are used in combination in a buccal spray preparation (*Sativex*) as adjunctive treatment for the symptomatic relief of neuropathic pain in multiple sclerosis in adults. This same preparation is also used as adjunctive analgesic treatment in adult patients with advanced cancer who have moderate to severe pain during the highest tolerated dose of strong opioid therapy for persistent background pain.

Cannabinoids are also being investigated for a number of other potential therapeutic uses, including relief of spasticity in multiple sclerosis, in spinal cord injury, and in various forms of pain, including diabetic neuropathy and other types of neuropathic pain, and pain associated with rheumatoid arthritis. Cannabis reduces intra-ocular pressure and it has been reported to be of benefit in glaucoma. Vaporisation is being investigated as a means of delivering therapeutic doses of cannabinoids.

Abuse. Cannabis is widely abused as a psychoactive agent and has a long history of such use. The amount of Δ^9-tetrahydrocannabinol in cannabis depends on its geographical source. Proportions also differ depending on the form used and have been reported as: 1 to 4% in the leaves and flowering tops, or even up to 15% in some varieties bred for a high yield of cannabinoids (so-called skunk); 5 to 12% in sinsemilla (obtained from unpollinated female plants); 3 to 6% in the dried resin (hashish); and 30 to 50% in hashish oil expressed from the pressed resin. The usual route of abuse is by smoking cigarettes containing the dried leaves and flowering parts of the plant or the more potent dried resin (hashish); inhalation using water pipes or vaporisers are alternative methods. Cannabis is also ingested in cakes or sweets. Less commonly, cannabis extract or hashish oil is injected intravenously.

Canola Oil

Cánola, aceite de.

CAS — 120962-03-0.

Profile

Canola oil is a form of rapeseed oil (p.2378) from strains selected for low erucic acid content. It is used as an edible oil and in pharmaceutical manufacturing and cosmetics.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***NZ:*** Mr Nits.

Cantharides

Blistering Beetle; Cantáridas; Cantharis; Insectes Coléoptères Hétéromères; Lytta; Méloides; Russian Flies; Spanish Fly.

Шпанские Мушки

Adverse Effects

The adverse effects of cantharides are those of its active component, cantharidin, below.

Uses and Administration

Cantharides is the dried beetle *Cantharis vesicatoria* (*Lytta vesicatoria*) (Meloidae) or other spp., containing not less than 0.6% of cantharidin, which is a protective exudate produced by the beetles. The properties of cantharides are those of its active principle, cantharidin (below).

Mylabris (Chinese blistering beetle; Chinese cantharides; Indian blistering beetle), the dried beetles of the species *Mylabrus sidae* (= *M. phalerata*), *M. cichorii*, and *M. pustulator*, has been used as a substitute for cantharides and as a source of cantharidin (see below) in the East.

Homoeopathy. Cantharides has been used in homoeopathic medicines under the following names: Cantharis; Lytta vesicatoria; Canthr.

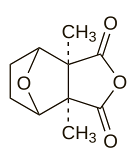
Cantharidin

Cantaridina. Hexahydro-3aα,7aα-dimethyl-4β,7β-epoxyisobenzofuran-1,3-dione.

Кантаридин

$C_{10}H_{12}O_4$ = 196.2.

CAS — 56-25-7.



Adverse Effects and Treatment

The adverse effects of cantharidin, a protective exudate produced by blistering beetles (see under Cantharides above), are a result of its irritant and vesicant properties and may occur after exposure to preparations of cantharidin or to the beetle itself. Cantharidin produces blistering of mucous membranes. After ingestion of cantharidin there is burning pain in the throat and stomach, difficulty in swallowing, nausea, vomiting, haematemesis, abdominal pain, diarrhoea (sometimes bloody), tenesmus, renal pain, frequent micturition, dysuria, priapism, haematuria, proteinuria, renal failure, severe hypotension, and circulatory failure. Severe gastrointestinal disturbances can produce significant morbidity. Oral doses of cantharidin ranging from 10 to 80 mg have been lethal, although there have been reports of survival after doses up to 175 mg. Cantharidin is lipid soluble and oral bioavailability is increased in the presence of fatty substances.

Dermatological exposure may produce dermatitis, blisters, and ulceration, although symptoms may not appear until several hours later. Significant dermal exposure can give rise to systemic toxicity. Keratoconjunctivitis, iritis, and oedema may result from contact with the eyes or surrounding tissues.

Cantharidin has been abused as a sex stimulant.

Treatment of cantharidin poisoning is largely supportive. Emesis must be avoided following oral ingestion because of the severe irritant effect of cantharidin on mucous membranes. Activated charcoal has been tried, although it is not certain whether it binds to cantharidin.

Poisoning. References.

4. Tagwireyi D, *et al.* Cantharidin poisoning due to "Blister beetle" ingestion. *Toxicon* 2000; **38:** 1865–9.

Uses and Administration

Cantharidin is obtained from cantharides or mylabris (see under Cantharides, above). Cantharidin has vesicant activity and a solution of 0.7% in flexible collodion is applied for the removal of warts and molluscum contagiosum. Preparations of cantharides and cantharidin have also been used externally as rubefacients and counter-irritants. Owing to the intensely irritating nature of cantharidin it should not be taken internally. Also it should not be applied over large surfaces because of the risk of absorption.

Preparations of cantharides and cantharidin were formerly promoted for hair loss but their use in cosmetic products is now prohibited in the UK by law.

Capsicum

Capsic.; Capsici fructus; Chillies; Espanjanpippuri; Paprikový plod; Paprikų vaisiai; Piment de cayenne; Piment Rouge; Pimentão; Red Pepper; Spanischer Pfeffer; Spansk peppar.

NOTE. Ground cayenne pepper of commerce is normally a blend of varieties of capsicum. Paprika is from *Capsicum annuum* var. *longum*; it is milder than capsicum.

Pharmacopoeias. In *Eur.* (see p.vii), *Jpn*, and *US*.

Eur. and *US* also include capsicum oleoresin (capsicin).

Ph. Eur. 6.2 (Capsicum). The dried ripe fruits of *Capsicum annuum* var. *minimum* and small-fruited varieties of *C. frutescens*. It contains a minimum of 0.4% of total capsaicinoids expressed as capsaicin, calculated with reference to the dried drug. Protect from light.

Ph. Eur. 6.2 (Capsicum Oleoresin, Refined and Quantified). A red or brown mobile extract that contains 6.5 to 8.0% of capsaicinoids expressed as capsaicin. It is produced from the herbal drug and alcohol or methyl alcohol by an appropriate procedure.

USP 31 (Capsicum). The dried ripe fruits of *Capsicum frutescens*, known in commerce as African Chillies, or of *C. annuum* var. *connoides*, known in commerce as Tabasco Pepper, or *C. annuum* var. *longum*, known in commerce as Louisiana Long Pepper, or of a hybrid between the Honka variety of Japanese Capsicum and the Old Louisiana Sport Capsicum, known in commerce as Louisiana Sport Pepper.

USP 31 (Capsicum Oleoresin). An alcoholic extract of the dried ripe fruits of *Capsicum annum* var. *minimum* and small fruited varieties of *C. fruiscons* (Solanaceae). It contains not less than 8% of total capsaicins. It is a dark red oily liquid. Soluble in alcohol, in acetone, in chloroform, in ether, and in volatile oils; soluble with opalescence in fixed oils. Store in airtight containers.

Profile

Capsicum has a carminative action but it is mainly used externally, often in the form of capsicum oleoresin, as a counter-irritant (see Rubefacients and Topical Analgesia, p.5). It is also included in preparations for the management of cough and cold symptoms. However, preparations of capsicum and capsicum oleoresin can be very irritant. Capsaicin (p.32), the active ingredient of capsicum, is also used in topical preparations in the treatment of painful skin conditions.

Capsicum oleoresin is used in 'pepper sprays' for law enforcement and self defence.

Capsicum also has culinary uses.

Homoeopathy. Capsicum has been used in homoeopathic medicines under the following names: Capsicum annuum; Cap. a.

Effects on the gastrointestinal tract. The initial response to the ingestion of a hot pepper is a hot or burning sensation in the mouth, which is attributed to the binding of capsaicin to receptors in the oral cavity.[1] Casein-containing substances such as milk can reverse this burning sensation, apparently by displacing capsaicin, this being due to their lipophilicity.

Spicy meals have long been associated with gastrointestinal discomfort and ingestion of meals containing 1.5 g of red or black pepper has been shown to cause signs of gastric mucosal damage comparable with those caused by a 625-mg dose of aspirin.[2] However, other studies in *animals*[3] and humans[4,5] suggest that capsaicin may have a protective effect on gastric mucosa. Ingestion of about 30 g of jalapeño peppers (a capsicum fruit) caused no visible damage to the duodenal or gastric mucosa of 12 healthy subjects[6] and daily ingestion of meals containing a total of 3 g of chilli powder did not affect the clinical progress of patients with duodenal ulcers given antacids.[7]

Caraway

Alcaravea; Alcaravia; Caraway Fruit; Caraway Seed; Carum; Carvi; Carvi fructus; Cumin des Prés; Fructus Carvi; Kmínový plod; Kmynų vaisiai; Köménytermés; Kumina; Kümmel; Kummin; Owoc kminku.

Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF*.

Ph. Eur. 6.2 (Caraway Fruit; Caraway BP 2008). The whole, dried fruits of *Carum carvi*. It contains not less than 3.0% v/w of essential oil, calculated with reference to the dried drug. It has an odour reminiscent of carvone. Protect from light.

The BP 2008 directs that when Powdered Caraway is prescribed or demanded, material containing not less than 2.5% v/w of essential oil shall be dispensed or supplied.

USNF 26 (Caraway). The dried, ripe fruit of *Carum carvi* (Apiaceae). Preserve against attack by insects.

Profile

Caraway is an aromatic carminative, and is used in gastrointestinal disorders and as a flavour. The seeds have culinary uses. It is the source of caraway oil (below).

Preparations

USNF 26: Compound Cardamom Tincture.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Mag Kottas Krauterexpress Abfuhrtee; Midro Tee; Montana; Nesthakchen; Species Carvi comp†; ***Braz.:*** Balsamo Branco; ***Cz.:*** Blahungstee N†; Iberogast; ***Ger.:*** Carminativum Hofmann; Carminativum-Hetterich; Carminativum-Pascoe†; Cholosom-Tee; Floradix Multipretten N; Gastrol S†; Gastrosecur†; Iberogast; Lomatol†; Majocarmin-Tee; Montana N; Pascoventral; Presselin Blahungs K 4 N†; Presselin Dyspeptikum†; Stovalid N†; ***Israel:*** Jungborn; Lido Tea; Midro-Tea; ***Ital.:*** Anice (Specie Composta)†; Cadifen; Cadimint; Camomilla (Specie Composta)†; Florelax; Midro; Relaxcol; Tarassaco (Specie Composta)†; ***Pol.:*** Apinorm; Laxantol; Melis-Tonic; Rhelax; Tabletki Przeciw Niestrawnosci; Tabulettae Laxantes; ***Rus.:*** Herbion Drops for the Gallbladder (Гербион Капли Желчегонные); Herbion Drops for the Stomach (Гербион Желудочные Капли); ***S.Afr.:*** Clairo; ***Spain:*** Natusor Aerofane†; ***Switz.:*** Kernosan Heidelberger Poudre; Phytomed Gastro†; Tisane favorisant l'allaitement.

Caraway Oil

Alcaravea, aceite esencial de; Carvi aetheroleum; Carvi Ethereoleum; Carvi, huile essentielle de; Kmínová silice; Kuminaöljy; Kümmelöl; Kumminolja; Olejek kminkowy; Oleum Cari; Oleum Carui; Oleum Carvi.

Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Caraway Oil). The oil obtained by steam distillation from the dry fruits of *Carum carvi*. A clear, colourless or yellow liquid. Relative density 0.904 to 0.920. Store in well-filled, airtight containers at a temperature not exceeding 25°. Protect from light.

USNF 26 (Caraway Oil). The volatile oil distilled from caraway. It contains not more than 50% v/v of carvone ($C_{10}H_{14}O$). Soluble 1 in 8 of alcohol (80%). Store in airtight containers. Protect from light.

Profile

Caraway oil is an aromatic carminative and is used in gastrointestinal disorders and as a flavour. It is also employed as caraway water for infant colic (see Gastrointestinal Spasm, p.1696).

Preparations

BP 2008: Aromatic Cardamom Tincture; Compound Cardamom Tincture.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Nesthakchen; Parodontax; Sabatif; Sigman-Haustropfen; Spasmo Claim; ***Cz.:*** Contraspan†; Naturident†; ***Ger.:*** Aspasmon N†; Enteroplant; Euflat I†; Floradix Multipretten N; Galloselect M†; Gastricard†; Gastrysat; Lomatol†; Majocarmin forte†; Neo-Ballistol†; Pascopankreat novo†; ratioGast†; ***Hung.:*** Enteroplant; ***India:*** Bestozyme; Catazyme-P; Neopeptine; Vitazyme; ***Ital.:*** Relaxcol; ***Mex.:*** Enterokan; ***Singapore:*** Enterokan†; ***Switz.:*** Flatulex; Huile Po-Ho A. Vogel; Parodontax†; ***Thai.:*** Gas-Nep; Gripe Mixture; ***UK:*** Atkinson & Barker's Gripe Mixture; Nurse Harvey's Gripe Mixture.

Carbon-13

Carbono 13.

CAS — 14762-74-4.

Profile

Carbon-13 is a naturally occurring, non-radioactive, stable isotope of carbon. It has been used to label organic compounds, such as urea (p.1620), for use in diagnostic tests, including breath tests for the diagnosis of *Helicobacter pylori* infection.

Preparations

USP 31: Urea C 13 for Oral Solution.

Proprietary Preparations (details are given in Part 3)

Cz.: Pylobactell; ***Denm.:*** Diabact; Helicobacter Test; ***Fr.:*** Heli-Kit; ***Gr.:*** Helicobacter; Pylobactel; ***Ital.:*** Breathquality-UBT; Citredici UBT Kit; Expirobacter; Helicokit; Pylobactell†; ***Mex.:*** Alitest†; ***Neth.:*** Helico State; Pylobactell-13C; UBTest; ***Port.:*** Helico-teste; Helicobacter Test; Ubit; ***Spain:*** Pylori Chek†; Tau Kit; Ubtest; ***Swed.:*** Diabact UBT; Helicobacter Test; ***Switz.:*** Helicobacter Test; Pylori 13†; ***UK:*** Diabact UBT; Pylobactell; ***USA:*** Meretek UBT.

Multi-ingredient: ***USA:*** Ez-HBT.

Cardamom

Cardamomi; Cardamomo, fruto del.

Pharmacopoeias. In *Br.* and *Jpn.* Also in *USNF.*

BP 2008 (Cardamom Fruit). The dried, nearly ripe fruit of *Elettaria cardamomum* var. *minuscula*. Only the seeds are used in making preparations of cardamom and they are used immediately after removal from the fruit. The seeds should not be stored after removal from the fruit. They have a strongly aromatic odour and taste and contain not less than 4% v/w of volatile oil.

USNF 26 (Cardamom Seed). The dried ripe seed of *Elettaria cardamomum* (Zingiberaceae), recently removed from the capsule. Preserve against attack by insects.

Profile

Preparations of cardamom are used as carminatives and as flavours. The seeds have culinary uses. Cardamom seeds are the source of cardamom oil (below).

Preparations

USNF 26: Compound Cardamom Tincture.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Peritone; Travelaide†; ***Austria:*** Mariazeller; ***Cz.:*** Dr Theiss Rheuma Creme†; Dr Theiss Schwedenbitter; Klosterfrau Melisana; ***Ger.:*** Gallexier; Montana N; Presselin Dyspeptikum†; Schwedentrunk Elixier; ***India:*** Carmicide; ***Pol.:*** Melisana Klosterfrau; ***Rus.:*** Suprima-Broncho (Суприма-бронхо); ***S.Afr.:*** Alma; Enterodyne; Helmontskruie; ***Spain:*** Digestovital†; ***Switz.:*** Stomacine; ***Thai.:*** Carmicide†; ***UK:*** Indian Brandee; Pegina.

Cardamom Oil

Cardamomo, aceite esencial de; Ol. Cardamom.

Pharmacopoeias. In *Br.* Also in *USNF.*

BP 2008 (Cardamom Oil). A clear, colourless or pale yellow liquid, visibly free from water, with an odour of cardamom fruit. It is distilled from crushed cardamom fruit. At 20° it is soluble 1 in 6 of alcohol (70%). Store at a temperature not exceeding 25° in well-filled containers. Protect from light.

USNF 26 (Cardamom Oil). The volatile oil obtained from cardamom seed. Soluble 1 in 5 of alcohol (70%). Store in airtight containers. Protect from light.

Profile

Preparations of cardamom oil are used as carminatives and as flavours.

Preparations

BP 2008: Aromatic Cardamom Tincture; Compound Cardamom Tincture; Compound Rhubarb Tincture.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***India:*** Catazyme-P; Digeplex; Vitazyme; ***Thai.:*** Gas-Nep.

Carglumic Acid *(rINN)*

Acide Carglumique; Ácido carglúmico; Acidum Carglumicum; Carglutamic Acid; Karglumik Asit. *N*-Carbamoyl-L-glutamic acid.

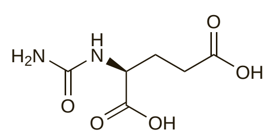
Карглумовая Кислота

$C_6H_{10}N_2O_5$ = 190.2.

CAS — 1188-38-1.

ATC — A16AA05.

ATC Vet — QA16AA05.



Profile

Carglumic acid is used for the treatment of hyperammonaemia in patients with *N*-acetylglutamate synthase deficiency. The initial daily dose ranges from 100 to 250 mg/kg, adjusted thereafter to maintain normal plasma levels of ammonia. Individual responsiveness to carglumic acid should be tested before starting long-term therapy; daily maintenance doses range from 10 to 100 mg/kg. The total daily dose should preferably be taken as 2 to 4 divided doses before food.

Carnauba Wax

Brazil Wax; Caranda Wax; Carnauba, cire de; Cera carnauba; Cera Copeniciae; Cera de carnauba; E903; Karnauba pálmaviasz; Karnaubavaha; Karnaubavax; Karnaubo vaškas; Vosk karnaubský.

CAS — 8015-86-9.

Pharmacopoeias. In *Eur.* (see p.vii), *Int.*, and *Jpn.* Also in *USNF.*

Ph. Eur. 6.2 (Carnauba Wax). It is obtained from the leaves of *Copernicia cerifera*. Pale yellow or yellow powder, flakes, or hard masses. It has a relative density of about 0.97. M.p. 80° to 88°. Practically insoluble in water and in alcohol; soluble on heating in ethyl acetate and in xylene. Protect from light.

USNF 26 (Carnauba Wax). It is obtained from the leaves of *Copernicia cerifera* (Palmae). A light brown to pale yellow, moderately coarse powder or flakes, possessing a characteristic bland odour, and free from rancidity. Sp. gr. about 0.99. M.p. 80° to 86°. Insoluble in water; slightly soluble in boiling alcohol; soluble in warm chloroform and in warm toluene; freely soluble in warm benzene.

Profile

Carnauba wax is used in pharmacy as a coating agent. Its use is also permitted in certain foods. Various types and grades are used industrially in the manufacture of polishes.

Caroverine *(pINN)*

Caroverina; Carovérine; Caroverinum. 1-[2-(Diethylamino)ethyl]-3-(*p*-methoxybenzyl)-2(1*H*)-quinoxalinone.

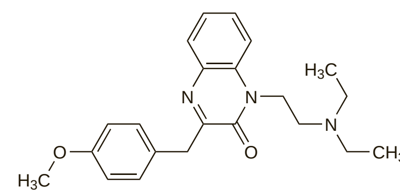
Кароверин

$C_{22}H_{27}N_3O_2$ = 365.5.

CAS — 23465-76-1.

ATC — A03AX11.

ATC Vet — QA03AX11.



Profile

Caroverine is a smooth muscle relaxant with calcium-channel blocking and glutamate-antagonist properties. It is used as the base or the hydrochloride in conditions associated with painful smooth muscle spasm. Typical doses (expressed as the base) are 20 to 40 mg by mouth three or four times daily. It may also be given by slow intravenous or intramuscular injection in doses of 40 to 80 mg. Caroverine has also been given rectally. It is also used in cerebral circulatory disorders and in tinnitus.

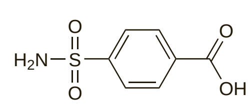
Carzenide *(rINN)*

Carcenida; Carzenida; Carzénide; Carzenidum. *p*-Sulphamoylbenzoic acid.

Карзенид

$C_7H_7NO_4S$ = 201.2.

CAS — 138-41-0.



Profile
Carzenide is an antispasmodic that has been used in the treatment of dysmenorrhoea.

Preparations
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Saldeva†.

Oriental Cashew

Anacardier d'orient; Anacardium; Cashew-pähkinä; Indisk nöt; Marking Nut Tree; Markingnut Tree; Nanercz wschodni; Semecarpus anacardium.

Pharmacopoeias. *Eur.* (see p.vii) includes a form for homoeopathic preparations.

Ph. Eur. 6.2 (Oriental Cashew for Homoeopathic Preparations; Semecarpus Anacardium ad Praeparationes Homoeopathicas). The dried fruit of *Semecarpus anacardium* (*Anacardium orientale*). It contains a minimum 6.0% of total phenol derivatives expressed as eugenol.

Profile
Various parts of the oriental cashew, *Semecarpus anacardium* (Anacardiaceae), and their preparations are used in traditional Indian medicine. The oil contains bhilawanols, irritant substances reputed to have cytotoxic action.

Homoeopathy. The dried ripe fruit of oriental cashew is used in homoeopathic medicines under the following names: Anacardium; Semecarpus anacardium; Anacardium orientale; Anac. or.

Cassia Oil

Canela de la China, aceite de; Cannelier, huile essentielle de; Chinese Cinnamon Oil; Cinnamomi cassiae aetheroleum; Cinnamomi Cassiae Etheroleum; Kassiakaneliöljy; Kassiaolja; Kínai fahéjolaj; Kinini̧ cinamonų eterinis aliejus; Oleum Cassiae; Oleum Cinnamomi; Oleum Cinnamomi Cassiae; Silice skořicovníku čínského.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *Jpn.*

Chin. and *Jpn* also include cassia bark which may be known as cinnamon bark. In some countries cassia oil is known as cinnamon oil (p.2283).

Ph. Eur. 6.2 (Cassia Oil). The oil obtained by steam distillation of the leaves and young branches of *Cinnamomum cassia* (*C. aromaticum*). It contains 70 to 90% of cinnamaldehyde. A clear, mobile, yellow to reddish-brown liquid, with a characteristic odour of cinnamaldehyde. Store in well-filled airtight containers. Protect from light and heat.

Profile
Cassia oil has properties resembling those of cinnamon oil (p.2283) and is used similarly as a carminative and flavour. It has also been used in aromatherapy. Hypersensitivity to cinnamaldehyde, the main constituent of cassia oil, has been reported.

Preparations
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Tiger Balm Red; ***S.Afr.:*** Balsem Vita GEEL; Balsem Vita ROOI; Balsem Vita WIT; Moultons Pain Paint; Stuidruppels; ***UK:*** Dragon Balm.

Castor Oil

Aceite de Ricino; Hintyağı; Huile de Ricin; Ol. Ricin.; Oleum Ricini; Ricini Oleum; Ricini Oleum Virginale; Ricino, aceite de; Ricinolja (jungfruolja); Ricinový olej panenský; Ricinusolaj; Risiiniöljy, neitsytöljy; Rizinusöl.

ATC — A06AB05.
ATC Vet — QA06AB05.

NOTE. CASOIL is a code approved by the BP 2008 for use on single unit doses of eye drops containing castor oil where the individual container may be too small to bear all the appropriate labelling information.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Jpn,* and *US.*

Eur. also includes hydrogenated castor oil and refined castor oil. *USNF* includes hydrogenated castor oil.

Ph. Eur. 6.2 (Castor Oil, Virgin). The fatty oil obtained by cold expression from the seeds of *Ricinus communis*. Relative density about 0.958. It is a clear, almost colourless or slightly yellow, viscous, hygroscopic liquid. Miscible with alcohol and with glacial acetic acid; slightly soluble in petroleum spirit. Store in well-filled airtight containers. Protect from light.

Ph. Eur. 6.2 (Castor Oil, Hydrogenated; Ricini Oleum Hydrogenatum). The oil obtained by hydrogenation of castor oil. It consists mainly of the triglyceride of 12-hydroxystearic acid. Almost white to pale yellow fine powder, masses, or flakes. M.p. 83° to 88°. Practically insoluble in water and in petroleum spirit; very slightly soluble in dehydrated alcohol; slightly soluble in dichloromethane. Store in well-filled containers.

Ph. Eur. 6.2 (Castor Oil, Refined). The fatty oil obtained by cold expression from the seeds of *Ricinus communis* and then refined. A suitable antoxidant may be added. Relative density about 0.958. It is a clear, almost colourless or slightly yellow, viscous, hygroscopic liquid. Miscible with alcohol and with glacial acetic acid; slightly soluble in petroleum spirit. Store in well-filled, airtight containers. Protect from light.

USP 31 (Castor Oil). The fixed oil obtained from the seed of *Ricinus communis* (Euphorbiaceae). It is a pale yellowish or almost colourless, transparent, viscid liquid. Has a faint, mild odour; is free from foreign and rancid odour; and has a bland, characteristic taste. Soluble in alcohol; miscible with dehydrated alcohol, with chloroform, with ether, and with glacial acetic acid. Store in airtight containers at a temperature not exceeding 40°.

USNF 26 (Hydrogenated Castor Oil). Refined, bleached, hydrogenated, and deodorised castor oil, consisting mainly of the triglyceride of hydroxystearic acid. A white, crystalline wax. M.p. 85° to 88°. Insoluble in water and in most common organic solvents. Store in airtight containers at a temperature not exceeding 40°.

Adverse Effects and Precautions
Oral administration of castor oil, particularly in large doses, may produce nausea, vomiting, colic, and severe purgation. Castor oil should not be given when intestinal obstruction is present.

The seeds of *Ricinus communis* contain a toxic protein, ricin (p.2379). Allergic reactions have been reported in subjects handling the seeds.

Uses and Administration
Castor oil is used externally for its emollient effect. It has also been used topically to allay irritation due to foreign bodies in the eye. Castor oil may be employed as the solvent in some injections.

Hydrogenated castor oil is used as a stiffening agent. Polyoxyl castor oils (p.1918) are used as emulsifying and solubilising agents.

Castor oil has been used as a laxative, but such use is obsolete.

Preparations
BP 2008: Chloroxylenol Solution; Flexible Collodion; Zinc and Castor Oil Ointment;
USP 31: Aromatic Castor Oil; Castor Oil Capsules; Castor Oil Emulsion; Flexible Collodion.

Proprietary Preparations (details are given in Part 3)

Catalase

Caperase; Catalasa; Equilase; Optidase.

Profile
Catalase is an enzyme obtained from a wide variety of biological sources including animal liver (hepatocatalase) and certain bacteria and fungi. It is a protein composed of 4 polypeptide subunits, the precise composition of which varies according to the source, and has a molecular weight of about 240 000. Catalase has the ability to promote the decomposition of hydrogen peroxide to water and oxygen.

It has been applied to wounds and skin ulcers and has also been used in the treatment of eczema. It has sometimes been used with glucose oxidase (p.2313) in food preservation to break down hydrogen peroxide produced during oxidation of glucose, and is also included in preparations for contact lens care to neutralise hydrogen peroxide.

Catalase is a free-radical scavenger and has been investigated for its ability to limit reperfusion injury thought to be related to free-radical production. Combinations of catalase with superoxide dismutase have also been investigated.

Catechu

Gambier; Gambir; Pale Catechu.

CAS — 8001-48-7.

NOTE. Distinguish from Black Catechu (p.2267).

Pharmacopoeias. In *Jpn.* Also in *BP(Vet).*

Chin. and *Jpn* include Ramulus Uncariae cum Uncis, the thorn from various species of *Uncaria*.

BP(Vet) 2008 (Catechu). A dried aqueous extract of the leaves and young shoots of *Uncaria gambier* occurring as dull pale greyish-brown to dark reddish-brown cubes. Odourless or almost odourless.

Profile
Catechu is an astringent and has been given in preparations for the treatment of diarrhoea and other gastrointestinal disorders.

Preparations
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Chemists Own Diarrhoea Mixture†; Diarcalm; ***Fr.:*** Elixir Bonjean; ***Indon.:*** Entrodiar; ***Ital.:*** Flavion; ***S.Afr.:*** Enterodyne; SB Diarrhoea Mixture; Tandpyndruppels; ***UK:*** Chesty Cough Relief; Spanish Tummy Mixture.

CD4 Antibodies

Anti-CD4 Monoclonal Antibodies; Anticuerpos CD4; CD4mAb; Monoclonal CD4 Antibodies.

Антитела Против СД4-Клеток

Profile
Monoclonal antibodies raised against CD4 receptors are under investigation in the treatment of immunologically mediated disorders, such as rheumatoid arthritis, multiple sclerosis, inflammatory bowel disease, asthma, cutaneous T-cell lymphoma, psoriasis, and various other skin disorders, with the aim of decreasing and eliminating circulating helper T lymphocytes. They have also been tried in transplantation. CD4 antibodies investigated include: clenoliximab, keliximab, priliximab, and zanolimumab.

Red Cedar

Eastern Red Cedar.

NOTE. Distinguish cedar wood oil, obtained from species of *Juniperus virginiana*, and cedar leaf oil, obtained from *Thuja occidentalis* (see Thuja, p.2400).

Profile
Red cedar, *Juniperus virginiana* (Cupressaceae), is the source of cedarwood oil (cedar wood oil; red cedar oil). The oil is used in perfumery and is included in preparations for nasal congestion and various skin disorders. It is also used in aromatherapy. Atlantic cedarwood oil (Atlas cedarwood oil) from *Cedrus atlantica* (Pinaceae) and oils from the wood of other species of *Juniperus* and *Cedrus* are used similarly.

Cedarwood oil should be distinguished from cedar leaf oil, obtained from *Thuja occidentalis* (see Thuja, p.2400).

Preparations
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Emser Nasensalbe; Wick Vaporub; ***Fr.:*** Vegebom; ***Ger.:*** Emser Nasensalbe N†; ***NZ:*** Vicks Vaporub; ***Port.:*** Betacade†; ***Swed.:*** Vicks Vaporub†; ***UK:*** No-Sor Vapour Rub.

Celery

Apio; Apium; Celery Fruit; Celery Seed.

CAS — 8015-90-5 (celery oil).

Profile
Celery consists of the dried ripe fruits of *Apium graveolens* (Umbelliferae). Other parts of the plant are also used. Celery is reported to have diuretic properties and has been included in herbal preparations for rheumatic disorders. Celery oil has also been used similarly. Allergic and photoallergic reactions have been reported.

Celery also has culinary uses. Celery seed oil is used in aromatherapy.

Homoeopathy. Celery has been used in homoeopathic medicines under the following names: Apium graveolens; Apium. gr.

◊ References.

Cellaburate (rINN)

Celaburát; Celaburato; Celiuliozės acetatas-butiratas; Cellaburatum; Cellulosaacetatbutyrat; Cellulose Acetate Butanoate; Cellulose Acetate Butyrate; Cellulose, acétate butyrate de; Cellulosi acetas butyras; Cellulóz-acetát-butirát; Selluloosa-asetaattibutyraatti.

Целлабурат

CAS — 9004-36-8.

NOTE. Cabufocon A and Cabufocon B are both USAN for cellulose acetate butyrate.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Cellulose Acetate Butyrate). A partly or completely *O*-acetylated and *O*-butyrated cellulose containing not less than 2.0% and not more than 30.0% of acetyl groups and not less than 16.0% and not more than 53.0% of butyryl groups, calculated with reference to the dried substance. A white, yellowish-white, or greyish-white, slightly hygroscopic, powder or granules. Practically insoluble in water and in alcohol; soluble in acetone, in formic acid, and in a mixture of equal volumes of methyl alcohol and dichloromethane. Store in airtight containers.

Profile

Cellaburate is a pharmaceutical excipient used in drug delivery systems. It has also been used in hydrophobic contact lens materials.

Cellobiose

Glucobiosa. 4-*O*-β-D-Glucopyranosyl-D-glucose.

$C_{12}H_{22}O_{11}$ = 342.3.

CAS — 528-50-7.

Profile

Cellobiose is an indigestible disaccharide that has been used to assess intestinal permeability. It has been used as an alternative to lactulose in the differential sugar absorption test (p.1739).

Cellulase (USAN)

Celulasa.

CAS — 9012-54-8.

Profile

Cellulase is a concentrate of cellulose-splitting (cellulolytic) enzymes derived from *Aspergillus niger* or other sources. It is used in food processing and has been given orally with other digestive enzymes for its supposed benefit in minor digestive disorders such as dyspepsia and flatulence. Hemicellulase has been given for similar purposes.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Pancrelase; ***Rus.:*** Festal (Фестал).

Centaury

Centáurea menor; Centaurée, petite; Centaurii herba; Centaurii Minoris Herba; Ezerjófű; Petite Centaurée; Rohtorantasappi; Širdažolių žolė; Tausendgüldenkraut; Tusengyllenört; Zeměžlučová nat'; Ziele centurii.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Centaury). The whole or fragmented dried flowering aerial parts of *Centaurium erythraea*. It has a bitter taste. Protect from light.

Profile

Centaury is used as a bitter, including for appetite loss and dyspepsia.

Hepatotoxicity. A report[1] of hepatotoxicity possibly associated with the use of *Copaltra*, a herbal preparation marketed as an adjunct in the treatment of diabetes mellitus and containing centaury and *Coutarea latiflora* (copalchi) (Rubiaceae). A further 5 cases had been reported to the French pharmacovigilance network.

1. Wurtz A-S, *et al.* Possible hepatotoxicity from Copaltra, an herbal medicine. *Ann Pharmacother* 2002; **36:** 941–2.

Cz.: Nat Zemezluce†.

Multi-ingredient: ***Austria:*** China-Eisenwein; Eryval; Magentee St Severin; Mariazeller; ***Braz.:*** Camomila; ***Cz.:*** Naturland Grosser Swedenbitter†; Stomaran; ***Fr.:*** Diacure; Tisane Hepatique de Hoerdt; ***Ger.:*** Amara-Tropfen; Canephron; Leber-Galle-Tropfen 83†; Montana N; Stullmaton†; ***Ital.:*** Assenzio (Specie Composta)†; Centaurea (Specie Composta)†; Genziana (Specie Composta)†; ***Rus.:*** Canephron N (Канефрон Н); Herbion Drops for the Stomach (Гербион Желудочные Капли); Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера); ***S.Afr.:*** Amara; Clairo; ***Spain:*** Natusor Hepavesical†; Odisor†; ***Switz.:*** Gastrosan; Phytomed Gastro†; Tisane pour l'estomac.

Cereus

Cactus; Night-blooming Cereus.

Profile

Cereus, the flowers and stems of night-blooming cereus (*Selenicereus grandiflorus*; *Cactus grandiflorus*) (Cactaceae), is thought to have cardiac stimulant actions and has been used in various cardiovascular disorders. It has also been used as an anthelmintic and in the treatment of rheumatism.

Homoeopathy. Cereus has been used in homoeopathic medicines under the following names: Cactus; Selenicereus grandiflorus; Cactus grandiflorus.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ger.:*** Cardibisana†; Oxacant N†; Oxacant-forte N†; Oxacant-Khella N†.

Ceruletide (BAN, USAN, rINN)

Caerulein; Cerulein; Ceruletid; Ceruletida; Cérulétide; Ceruletidum; FI-6934; 883-S; Seruletidi.

Церулетид

$C_{58}H_{73}N_{13}O_{21}S_2$ = 1352.4.

CAS — 17650-98-5 (ceruletide); 71247-25-1 (ceruletide diethylamine).

ATC — V04CC04.

ATC Vet — QV04CC04.

NOTE. The name Ceruleinum has been applied to Indigo Carmine (p.2324).

Description. Ceruletide is a decapeptide amide originally isolated from the skin of the Australian frog, *Hyla caerulea*, and other amphibians. Ceruletide may exist as a salt with 1 to 3 moles of diethylamine (ceruletide diethylamine).

Adverse Effects

Ceruletide stimulates gallbladder contraction and gastrointestinal muscle and may give rise to abdominal discomfort. Hypotensive reactions may also occur.

Uses and Administration

Ceruletide is structurally related to pancreozymin (p.2361) and has similar actions. When given parenterally it stimulates gallbladder contraction and relaxes the sphincter of Oddi; it also causes an increase in the secretion of pancreatic enzymes and stimulates intestinal muscle.

As ceruletide diethylamine it is used as an aid to diagnostic radiology and in the management of paralytic ileus. It is also used in tests of pancreatic exocrine function, sometimes with secretin (p.2384); these studies generally require duodenal intubation of the patient and examination of duodenal aspirate and are rarely performed.

For most radiographic procedures of the biliary and digestive tracts ceruletide diethylamine is given by intramuscular injection in a dose equivalent to 300 nanograms/kg of ceruletide. Doses equivalent to 1 to 2 nanograms/kg per minute are given by intravenous infusion in pancreatic function tests and in the treatment of paralytic ileus.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Takus.

Cevimeline Hydrochloride (USAN, rINNM)

AF-102; AF-102B; Céviméline, Chlorhydrate de; Cevimelini Hydrochloridum; FKS-508; Hidrocloruro de cevimelina; SND-5008; SNI-2011; SNK-508. (±)-*cis*-2-Methylspiro[1,3-oxathiolane-5,3′-quinuclidine] hydrochloride hemihydrate.

Цевимелина Гидрохлорид

$C_{10}H_{17}NOS,HCl,\frac{1}{2}H_2O$ = 244.8.

CAS — 107233-08-9 (cevimeline); 153504-70-2 (cevimeline hydrochloride).

Adverse Effects, Treatment, and Precautions

As for Neostigmine, p.631.

Sweating is a common problem with cevimeline; patients who sweat excessively should be advised to drink extra fluids to avoid dehydration. The manufacturer recommends that cevimeline should not be given when miosis is undesirable such as in patients with acute iritis or angle-closure glaucoma. Blurred vision may affect the performance of skilled tasks. In addition cevimeline should be given with care to those with renal calculi or with biliary-tract disorders. It should also be used with caution in patients deficient in the cytochrome P450 isoenzyme CYP2D6 who may be at a higher risk of adverse effects.

Interactions

As for Neostigmine, p.632.

Drugs which inhibit cytochrome P450 isoenzymes CYP2D6, CYP3A3, or CYP3A4 inhibit the metabolism of cevimeline.

Pharmacokinetics

After oral doses cevimeline is absorbed from the gastrointestinal tract; peak concentrations are reached in 1.5 to 2 hours. The rate and extent of absorption are decreased when given with food. Cevimeline is less than 20% bound to plasma proteins. It is metabolised in the liver by cytochrome P450 isoenzymes CYP2D6, CYP3A3, and CYP3A4. Cevimeline is primarily excreted in the urine, mainly as metabolites; about 0.5% of a dose is excreted in the faeces.

Uses and Administration

Cevimeline is a selective muscarinic M_1 agonist used to improve the symptoms of dry mouth (see p.2140) in patients with Sjögren's syndrome. It is given as the hydrochloride by mouth in doses of 30 mg 3 times daily.

Dementia. Muscarinic M_1 agonists such as cevimeline have proved unsuccessful in relieving the symptoms of Alzheimer's disease (see p.362).

Preparations

Proprietary Preparations (details are given in Part 3)
USA: Evoxac.

Chamomile

Camomille romaine, fleur de (chamomile flower, Roman); Chamomillae romanae flos (chamomile flower, Roman); Heřmánkový květ (matricaria flower); Kamillavirágzat (matricaria flower); Kamomillankukka (matricaria flower); Kamomillankukka, roomalainen (chamomile flower, Roman); Kamomillblomma (matricaria flower); Kamomillblomma, romersk (chamomile flower, Roman); Koszyczek rumianku (matricaria flower); Květ heřmánku římského (chamomile flower, Roman); Manzanilla; Matricaire, fleur de (matricaria flower); Matricariae flos (matricaria flower); Ramunėlių žiedai (matricaria flower); Rómaikamillavirág (chamomile flower, Roman); Taurių̨jų didramunių žiedai (chamomile flower, Roman).

Description. The name Chamomile is used for the dried flowerheads from 2 species of *Compositae* having similar medicinal properties:

- Chamomile from *Anthemis nobilis* (*Chamaemelum nobile*) is known as Chamomile Flowers, Chamomillae Romanae Flos, Manzanilla Romana, or Roman Chamomile Flower.
- Chamomile from *Matricaria recutita* (*Chamomilla recutita*) is known as Camomile Allemande, Camomilla, Chamomilla, Chamomillae Anthodium, Flos Chamomillae, Flos Chamomillae Vulgaris, German Chamomile, Hungarian Chamomile, Kamillenblüten, Manzanilla Ordinaria, Matricaria Flower, or Matricariae Flos

Pharmacopoeias. *Eur.* (see p.vii) includes chamomile from *Anthemis nobilis* and *Matricaria recutita*. *US* includes chamomile from *Matricaria recutita*.
Eur. also includes Matricaria Oil.

Ph. Eur. 6.2 (Chamomile Flower, Roman; Chamomile Flowers BP 2008). The dried flowerheads obtained from the cultivated double variety of *Anthemis nobilis* (*Chamaemelum nobile*), containing not less than 0.7% v/w of essential oil, calculated with reference to the dried drug. It has a strong characteristic odour. Protect from light.

Ph. Eur. 6.2 (Matricaria Flower; Matricariae Flos; Matricaria Flowers BP 2008). The dried flowerheads obtained from *Matricaria recutita* (*Chamomilla recutita*), containing not less than 0.4% v/w of blue essential oil and 0.25% of apigenin-7-glucoside, calculated with reference to the dried drug. Protect from light.

Ph. Eur. 6.2 (Matricaria Oil; Matricariae Aetheroleum). The blue essential oil obtained by steam distillation from the fresh or dried flower-heads or flowering tops of *Matricaria recutita* (*Chamomilla recutita*). There are 2 types of matricaria oil which are characterised as rich in bisabolol oxides, or rich in levomenol. Store in a well-filled, airtight container at a temperature not exceeding 25°. Protect from light.

USP 31 (Chamomile). The dried flowerheads of *Matricaria recutita* (*Matricaria chamomilla*, *Matricaria chamomilla* var. *courrantiana, Chamomilla recutita*) (Asteraceae alt. Compositae). It contains not less than 0.4% of blue volatile oil, not less than 0.3% of apigenin-7-glucoside, and not less than 0.15% of bisabolane derivatives, calculated as levomenol. Protect from light.

Profile

Chamomile has been applied externally as a poultice in the early stages of inflammation, and preparations containing chamomile or extracts of chamomile (including the oil or a constituent, chamazulene), have been used for skin disorders, including the prevention and treatment of cracked nipples and nappy rash. Chamomile German oil and Chamomile Roman oil are used in aromatherapy. 'Chamomile tea' is a domestic remedy for indigestion and has also been reported to have hypnotic properties.

There have been reports of contact sensitivity and anaphylaxis.

Homoeopathy. Chamomile has been used in homoeopathic medicines under the following names: Chamomilla; Cham.

Multi-ingredient: numerous preparations are listed in Part 3.

Chaparral

Profile

Chaparral is derived from the creosote bush, *Larrea tridentata* (Zygophyllaceae). It has been included in various herbal preparations but such use has been associated with severe hepatotoxicity. Recommendations that products containing chaparral should not be consumed have been made in several countries.

Masoprocol (p.742) is an antineoplastic isolated from the creosote bush.

Chenodeoxycholic Acid *(BAN, rINN)*

Acide chénodésoxycholique; Ácido quenodeoxicólico; Acidum chenodeoxycholicum; CDCA; Chenic Acid; Chenodeoksicholio rūgštis; Chenodiol *(USAN)*; Kenodeoksikolik Asit; Kenodeoksikoolihappo; Kenodeoxicholsyra; Kenodezoxikólsav; Kyselina chenodeoxycholová. 3α,7α-Dihydroxy-5β-cholan-24-oic acid.

Хенодезоксихолевая Кислота

$C_{24}H_{40}O_4$ = 392.6.
CAS — 474-25-9.
ATC — A05AA01.
ATC Vet — QA05AA01.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.*
Ph. Eur. 6.2 (Chenodeoxycholic Acid). A white or almost white powder. Very slightly soluble in water; freely soluble in alcohol; soluble in acetone; slightly soluble in dichloromethane.

Adverse Effects and Precautions

As for Ursodeoxycholic Acid, p.2408. Diarrhoea may occur more frequently than with ursodeoxycholic acid. A transient rise in liver-function test values and hypercholesterolaemia (low-density lipoprotein) have been reported with chenodeoxycholic acid.

Chenodeoxycholic acid is embryotoxic in some *animals.*

Interactions

As for Ursodeoxycholic Acid, p.2408.

Pharmacokinetics

Chenodeoxycholic acid is absorbed from the gastrointestinal tract and undergoes first-pass metabolism and enterohepatic recycling. It is partly conjugated in the liver before being excreted into the bile and, under the influence of intestinal bacteria, the free and conjugated forms undergo 7α-dehydroxylation to lithocholic acid. Some lithocholic acid is excreted directly in the faeces and the rest absorbed, mainly to be conjugated and sulfated by the liver before excretion in the faeces. Chenodeoxycholic acid also undergoes epimerisation to ursodeoxycholic acid.

◊ References.

1. Crosignani A, *et al.* Clinical pharmacokinetics of therapeutic bile acids. *Clin Pharmacokinet* 1996; **30:** 333–58.

Uses and Administration

Chenodeoxycholic acid is a naturally occurring bile acid (p.2266). When given orally it reduces hepatic synthesis of cholesterol and provides additional bile salts to the pool available for solubilisation of cholesterol and lipids. It has been used for the dissolution of cholesterol-rich gallstones (p.2409) in patients with a functioning gallbladder, in usual doses of about 15 mg/kg daily. The daily dose may be divided unequally and the larger dose given before bedtime to counteract the increase in biliary cholesterol concentrations seen overnight. Treatment may need to be given for up to 2 years, depending on the size of the stone. It should be continued for about 3 months after radiological disappearance of the stones. Chenodeoxycholic acid is also used in reduced doses with ursodeoxycholic acid.

Chenodeoxycholic acid has been used as a dietary supplement in neonates and children with inborn errors of bile acid synthesis: it has been used in the treatment of cerebrotendinous xanthomatosis; with cholesterol in the Smith-Lemli-Opitz syndrome; and with cholic acid for bile acid synthesis defects.

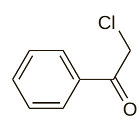
Chloroacetophenone

ω-Chloroacetophenone; 1-Chloroacetophenone; Cloroacetofenona; CN; CN Gas; Phenacyl Chloride. 2-Chloroacetophenone.

C_8H_7ClO = 154.6.
CAS — 532-27-4.



NOTE. The name mace is applied to solutions of chloroacetophenone.

Profile

Chloroacetophenone is a lachrymatory which is irritant to the skin and eyes. It has been used in a riot-control gas; it is described as a tear gas.

◊ References.

1. Hu H, *et al.* Tear gas—harassing agent or toxic chemical weapon? *JAMA* 1989; **262:** 660–3.

Chloroplatinic Acid

Cloroplatínico, ácido; Kloroplatinasyra; Kwas chloroplatynowy. Hexachloroplatinic acid hexahydrate.

$H_2PtCl_6,6H_2O$ = 517.9.
CAS — 16941-12-1 (anhydrous chloroplatinic acid); 18497-13-7 (chloroplatinic acid hexahydrate).

Profile

Aqueous solutions of platinic chloride ($PtCl_4$ = 336.9) are used in corneal tattooing solutions.

Chondroitin Sulfate Sodium

Chondroitin 4-Sulfate (chondroitin sulfate A); Chondroitin Sulphate Sodium; Chondroïtine, sulfate sodique de; Chondroitini natrii sulfas; Chondroitin-sulfát sodná sůl; Chondroityny sodu siarczan; CSA (chondroitin sulfate A); Sodium Chondroitin Sulfate; Sodyum Kondroitin Sülfat.

$(C_{14}H_{19}NO_{14}SNa_2)_n$.
CAS — 9007-28-7 (chondroitin sulfate); 9082-07-9 (chondroitin sulfate sodium); 24967-93-9 (chondroitin sulfate A); 39455-18-0 (chondroitin sulfate A sodium); 25322-46-7 (chondroitin sulfate C); 12678-07-8 (chondroitin sulfate C sodium).
ATC — M01AX25.
ATC Vet — QM01AX25.

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*
Ph. Eur. 6.2 (Chondroitin Sulphate Sodium). A natural copolymer based mainly on the two disaccharides obtained from cartilage of both terrestrial and marine origins. Depending on the animal species of origin, it shows different proportions of 4-sulfate and 6-sulfate groups. A white or almost white, hygroscopic powder. Freely soluble in water; practically insoluble in alcohol and in acetone. A 5% solution in water has a pH of 5.5 to 7.5. Store in airtight containers. Protect from light.
USP 31 (Chondroitin Sulfate Sodium). The sodium salt of the sulfated linear glycosaminoglycan obtained from bovine, porcine, or avian cartilages of healthy and domestic animals used for food by humans. It consists mostly of the sodium salt of the sulfate ester of *N*-acetylchondrosamine (2-acetamido-2-deoxy-β-D-galactopyranose) and D-glucuronic acid copolymer. These hexoses are alternately linked β-1,4 and β-1,3 in the polymer. Chondrosamine moieties in the prevalent glycosaminoglycan are monosulfated primarily on position 4 and less so on position 6. Chondroitin sulfate sodium is extremely hygroscopic once dried. Store in airtight containers.

Profile

Chondroitin sulfate is an acid mucopolysaccharide that is a constituent of most cartilaginous tissues. It is used as the sodium salt, chondroitin sodium sulfate. It is given orally in reactive arthritides (see under Spondyloarthropathies, p.13), such as gonococcal arthritis, and is sometimes given with glucosamine (p.2313) for its supposed chondroprotective action in bone, joint, and connective tissue disorders. It is also used for its visco-elastic properties as an adjunct to ocular surgical procedures, including cataract extraction and intra-ocular lens implantation, and has been used for the relief of dry eye. A medium containing chondroitin sulfate A has been used to preserve corneas for transplantation. Chondroitin sulfate sodium has also been used as a means of replacing the glycosaminoglycan layer in the bladder in the treatment of interstitial cystitis (p.2179). Chondroitin sulfate A and C are components of the heparinoid danaparoid (p.1255).

Osteoarthritis. For references to the use of chondroitin in the treatment of osteoarthritis, including doubts about its value, see under Glucosamine, p.2313.

Preparations

USP 31: Chondroitin Sulfate Sodium Tablets; Glucosamine and Chondroitin Sulfate Sodium Tablets; Glucosamine, Chondroitin Sulfate Sodium, and Methylsulfonylmethane Tablets.

Proprietary Preparations (details are given in Part 3)

Chrome Alum

Chromium Potassium Sulfate; Chromium Potassium Sulphate; Cromo, alumbre de.

$KCr(SO_4)_2,12H_2O$ = 499.4.
CAS — 10141-00-1 (anhydrous chrome alum); 7788-99-0 (chromium potassium sulfate dodecahydrate).

Profile

Chrome alum is used in leather tanning, as a mordant in dyeing, and for hardening gelatin in photographic materials. It has been used as a sclerosant in medicine.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Arg.:*** Skleremo†; ***Braz.:*** Varikromo†; ***Fr.:*** Scleremo.

Chromium Trioxide

Anhídrido Crómico; Chromic Acid; Chromic Anhydride; Chromu(VI) tlenek; Cromo, tríóxido de.
CrO_3 = 99.99.
CAS — 1333-82-0.

Profile

Chromium trioxide and other chromium compounds are used in industry. Solutions of chromium trioxide are corrosive, acting by oxidation. Repeated contact with chromium and its salts may cause eczematous dermatitis, particularly in hypersensitive persons and can also cause deep perforating ulcers known as 'chrome holes'. If inhaled, chromic dusts cause rhinitis and painless ulcers which may perforate the nasal septum; inhalation may cause severe lung damage and inflammation of the eyes. There may also be involvement of the CNS and there is an increased risk of lung cancer. Hexavalent chromium compounds are more dangerous than di- or trivalent compounds.

Acute symptoms of poisoning from the ingestion of chromium salts include intense thirst, dizziness, abdominal pain with vomiting and diarrhoea, hepatic injury, anuria or oliguria, and peripheral vascular collapse. Kidney damage may lead to fatal uraemia.

Treatment is symptomatic and supportive. Protective measures should be taken when handling or working with chromium and its salts.

Chromium trioxide was formerly used as a caustic and astringent.

Chromium is an essential trace element as described on p.1934.

Adverse effects. General references[1-4] to chromium toxicity including reports of poisoning with ammonium dichromate,[5] chromium tripicolinate,[6] chromium trioxide,[7] potassium dichromate,[8-10] and sodium dichromate.[11]

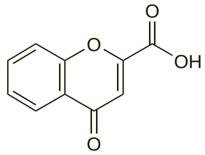
Handling. Chromium trioxide is a powerful oxidising agent and is liable to explode in contact with small quantities of alcohol, ether, glycerol, and other organic substances.

Chromocarb Diethylamine *(rINNM)*

Chromocarbe, Diéthylamine de; Chromocarbi Diethylaminum; Dietilamina de cromocarbo. The diethylamine salt of 4-oxo-4*H*-1-benzopyran-2-carboxylic acid .
Хромокарба Диэтиламин
$C_{14}H_{17}O_4N$ = 263.3.
CAS — 4940-39-0 (chromocarb).



(chromocarb)

Profile

Chromocarb diethylamine is used to reduce capillary haemorrhage (including conjunctival haemorrhage) associated with various disorders, and for venous insufficiency. It is given by mouth in doses of 0.6 to 1.2 g daily in divided doses. It is also used as eye drops; 1 or 2 drops of a 10% solution have been instilled up to 6 times daily.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: Angioftal†; ***Fr.:*** Angiophtal†; Campel; ***Ital.:*** Fludarene; ***Port.:*** Fradilen; ***Spain:*** Activadone.

Chrysoidine Hydrochloride Citrate

Crisoidina, hidrocloruro del citrato de. 4-Phenylazobenzene-1,3-diamine hydrochloride citrate; Azobenzene-2,4-diamine hydrochloride citrate.
$C_{12}H_{12}N_4,HCl,C_6H_8O_7$ = 440.8.
CAS — 532-82-1 (chrysoidine hydrochloride); 5909-04-6 (chrysoidine hydrochloride citrate).

Profile

Chrysoidine hydrochloride citrate has been used as a dye but has been associated with tumours of the bladder.

Carcinogenicity. The development of tumours of the urinary bladder in anglers was possibly associated with the use of chrysoidine hydrochloride (chrysoidine Y; CI Basic Orange 2; Colour Index No. 11270) for colouring the maggots used as bait.[1-3]

1. Searle CE, Teale J. Chrysoidine-dyed bait: a possible carcinogenic hazard to anglers? *Lancet* 1982; **i:** 564.

3. Massey JA, *et al.* Maggots dyed with chrysoidine. *BMJ* 1984; **289:** 1451–2.

Chymopapain *(BAN, USAN, rINN)*

BAX-1526; Chymopapaïne; Chymopapainum; Kymopapaiini; Kymopapain; NSC-107079; Quimopapaína; Quimopapaina.
Химопапаин
CAS — 9001-09-6.
ATC — M09AB01.
ATC Vet — QM09AB01.

Description. Chymopapain is a proteolytic enzyme isolated from the latex of papaya (*Carica papaya*), differing from papain in electrophoretic mobility, solubility, and substrate specificity. Molecular weight about 27 000.

Units

One nanokatal (nKat) is defined as the amount of chymopapain which produces 1 nanomole of *p*-nitroaniline per second from DL-benzoylarginine-*p*-nitroanilide substrate at pH 6.4 and 37°.

In some countries CTE units have been used, defined as the amount of chymopapain that produces a hydrolysate from acid-denatured haemoglobin at pH 4.0 in one minute with an optical density at 275 nm equivalent to that of a tyrosine solution 0.0001%.

Adverse Effects

The most important adverse effect of chymopapain is anaphylaxis, which can occur in up to about 1% of patients. It has resulted in fatalities and restricts use to a single treatment session per patient. Typical symptoms include angioedema, hypotension, laryngeal oedema and bronchospasm, shock, and cardiac arrest. Allergic skin reactions may also occur. Other reported reactions include headache, nausea and vomiting, paralytic ileus, urinary retention, thrombophlebitis, paraesthesias, foot-drop, and discitis. Severe muscle spasm and an increase in back pain are common. Paraplegia, acute transverse myelitis, and intracerebral and subarachnoid haemorrhage have occurred.

Incidence of adverse effects. A 1984 postmarketing surveillance study on a US chymopapain preparation for intradiscal injection (*Chymodiactin*) involved data from 29 075 patients (representing about 50% of the total number of vials sold).[1] Anaphylactic reactions were confirmed in 194 patients (0.67%), 2 of whom died. The incidence was higher in women than in men. In 52 cases the reaction occurred after the test dose. Serious neurological reactions reported were: cerebral haemorrhage (6 cases, 3 fatal; autopsy revealed that they had underlying cerebrovascular abnormalities); paraplegia (11 cases, 5 of which may have been due to incorrect needle placement); transverse myelitis with paraplegia (2 cases, after 2 and 3 weeks, with subsequent recovery); and seizures (2 cases on injection and 1 several days after the procedure). Twenty-two patients had discitis with severe back pain and spasm. In 9 cases bacteria could be cultured, and 1 patient subsequently developed fatal *Staphylococcus aureus* meningitis.

Another review[2] of serious reactions associated with chymopapain between 1982 and 1991 (including data from the earlier postmarketing study) involved 121 reports among about 135 000 patients. They included fatal anaphylaxis (7), infections (24), haemorrhage (32), and neurological reactions (32).

Both reviews concluded that careful attention to proper patient selection and correct techniques of intradiscal needle placement are the most important factors in avoiding adverse effects with chymopapain.

1. Agre K, *et al.* Chymodiactin postmarketing surveillance: demographic and adverse experience data in 29075 patients. *Spine* 1984; **9:** 479–85.
2. Nordby EJ, *et al.* Safety of chemonucleolysis: adverse effects reported in the United States, 1982–1991. *Clin Orthop* 1993; **293:** 122–34.

Precautions

Chymopapain should not be used in those patients with a known sensitivity to papaya proteins or in patients with progressive paralysis, or tumours of the spinal cord, or lesions of the cauda equina. Severe spondylolisthesis is also a contra-indication. It should not be given to patients with heart failure, coronary artery disease, or respiratory failure who may be at increased risk if anaphylaxis occurs, nor to patients receiving beta blockers.

Care is required in administering chymopapain to ensure that the injection is into the disc and not intrathecal. However, discography is not recommended since the use of contrast media may exacerbate neurotoxicity and may inactivate the enzyme.

The risk of allergic reactions associated with chymopapain is so high that no patient should ever receive it more than once. Tests to identify those most at risk and pretreatment with antihistamines (H_1 and H_2) and corticosteroids may be used, but facilities for the emergency management of anaphylactic reactions should always be to hand when giving patients chymopapain. The risk of anaphylaxis is higher in women.

Injection of more than one disc is associated with an increased frequency of neurological reactions; therefore, such injection should only be carried out following confirmation of definite further disc involvement.

Uses and Administration

Chymopapain is used as an injection into the intervertebral disc in the treatment of sciatic pain and other symptoms secondary to herniation of intervertebral discs of the lumbar spine (chemonucleolysis).

Chymopapain injection should preferably be given under local, rather than general, anaesthesia. The dose for a single intervertebral disc is 2 to 4 nanokatals, with a maximum dose per patient of 8 nanokatals.

Chemonucleolysis. Dissolution of the disc by injection of chymopapain or other enzymes (chemonucleolysis) has been used as an effective alternative to surgery in patients with lumbar disc herniation (see Low Back Pain, p.7). However, concerns about its safety have led to a decline in its use, and discectomy is often preferred.

Chymotrypsin *(BAN, rINN)*

Chimotripsinas; α-Chymotrypsin; Chymotrypsine; Chymotrypsinum; Kimotripszin; Kymotrypsiini; Kymotrypsin; Quimotripsina.
Химотрипсин
CAS — 9004-07-3.
ATC — B06AA04; S01KX01.
ATC Vet — QB06AA04; QS01KX01.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *US.*

Ph. Eur. 6.2 (Chymotrypsin). A proteolytic enzyme obtained by the activation of chymotrypsinogen extracted from the pancreas of beef. It contains not less than 5 microkatals in each mg. A white or almost white, crystalline or amorphous powder; the amorphous form is hygroscopic. Sparingly soluble in water. A 1% solution in water has a pH of 3.0 to 5.0. Solutions have a maximum stability at pH 3 and a maximum activity at about pH 8. Store at 2° to 8° in airtight containers. Protect from light.

USP 31 (Chymotrypsin). A proteolytic enzyme crystallised from an extract of the pancreas gland of the ox, *Bos taurus* (Bovidae). It contains not less than 1000 USP units in each mg, calculated on the dried basis. A white to yellowish-white, crystalline or amorphous, odourless powder. An amount equivalent to 100 000 USP units is soluble in 10 mL of water and in 10 mL of sodium chloride 0.9%. Store in airtight containers at a temperature not exceeding 40°.

Units

Various methods have been used to assay the potency of chymotrypsin. Ph. Eur. 6.2 expresses activity in terms of microkatals while USP 31 expresses in terms of USP units. Other units that may be encountered are FIP units, Armour units, and Denver (or Wallace or Wampole) units.

Uses and Administration

Chymotrypsin is a proteolytic enzyme that has been used in ophthalmology for the dissection of the zonule of the lens, thus facilitating intracapsular cataract extraction and reducing trauma to the eye. For this purpose a solution of chymotrypsin in a sterile diluent such as sodium chloride 0.9% has been injected to irrigate the posterior chamber.

Chymotrypsin has also been given, usually by mouth or topically, for its supposed action in reducing soft-tissue inflammation and oedema associated with surgery or traumatic injuries, and in patients suffering from upper respiratory-tract disorders.

Hypersensitivity reactions have been reported.

Preparations

USP 31: Chymotrypsin for Ophthalmic Solution.

Ciliary Neurotrophic Factor

CNTF; Factor neurotrófico ciliar.

Цилиарный Нейротрофический Фактор

Profile

Ciliary neurotrophic factor (CNTF) is a nerve growth factor produced in neural tissues and released in response to injury. Recombinant CNTF has been investigated in motor neurone disease (p.2380), peripheral neuropathy, and obesity. CNTF is also under investigation for the treatment of retinitis pigmentosa and atrophic (dry) age-related macular degeneration as an intra-ocular polymer implant containing human retinal epithelial cells that have been genetically modified to secrete CNTF.

Cimicifuga

Actée à grappes; Black Cohosh; Black Snakeroot; Bugbane; Cimicífuga; Cimicifugae rhizoma; Cohosh negro.

NOTE. Distinguish from Blue Cohosh, p.2267.

Pharmacopoeias. *Chin.* includes the rhizome of *Cimicifuga heracleifolia*, *C. dahurica*, and *C. foetida*.
Jpn includes the rhizome of *C. simplex*, *C. heracleifolia*, *C. dahurica*, and *C. foetida*.
US includes the rhizome and roots of *C. racemosa*. *US* also includes the powdered form.
USP 31 (Black Cohosh). The dried rhizome and roots of *Actaea racemosa* (*Cimicifuga racemosa*). It contains not less than 0.4% triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$ = 660.8) with reference to the dried drug. Protect from light and moisture.

Profile

Cimicifuga, the roots of *Cimicifuga racemosa* (*Actaea racemosa*) (Ranunculaceae), is used for menopausal and gynaecological disorders and is included in preparations for coughs.

Homoeopathy. Cimicifuga has been used in homoeopathic medicines under the following names: Actaea racemosa; Actaea rac.; Cimicifuga racemosa; Cim. rac.

Adverse effects. A systematic review of the limited data available on adverse effects for cimicifuga concluded that adverse effects are generally mild and transient.[1] It has been reported that cimicifuga may cause dizziness, vertigo, headache, vomiting, and gastrointestinal irritation when taken in large doses.[2] From January 1998 to February 2005, Health Canada[3] had received 7 reports of adverse effects suspected of being associated with black cohosh, including dizziness, rash, pruritus, oedema, increased pulse, bradycardia, atrial fibrillation, changes in plasma-thyroid hormone concentration, vaginal bleeding, and convulsions. However, lack of data meant that causality could not be proved.

As of March 2006, the UK MHRA[2] had received 21 reports of **hepatotoxicity** associated with cimicifuga ingestion since 1998, which represented more than two-thirds of the total number of reports for any reaction related to cimicifuga. Likewise, there have been similar reports of hepatotoxicity in other countries including the USA, Germany, and Sweden.[2] Up to April 2006, 11 cases of liver impairment associated with cimicifuga had also been reported in Australia.[4] Adverse liver reactions reported worldwide have included abnormal liver function tests, jaundice, hepatitis, and liver failure.[2] In general, patients showed signs of recovery on stopping ingestion.[2] Some regulatory authorities consider that the available evidence supports a rare association between cimicifuga and risk of liver toxicity, even though the level of risk is difficult to determine.[2,5,6] They have recommended that warnings regarding potential adverse liver reactions should be added to product information and consumers are advised to stop taking cimicifuga if they develop symptoms of liver damage;[2,5-7] also, patients who have previously had liver or other serious health problems should consult their doctor before starting to take cimicifuga.[2,6]

Cinchona Bark

Chinae Cortex; Chinarinde; Chininmedžių žievė; Chinovníková kůra; Cinchona; Cinchonae cortex; Cinchonae Succirubrae Cortex; Jesuit's Bark; Kiinankuori; Kinabark; Peruvian Bark; Quina; Quina Vermelha; Quino, corteza del; Quinquina; Quinquina Rouge; Red Cinchona Bark; Vöröskínafa-kéreg.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Cinchona Bark). The whole or cut, dried bark of *Cinchona pubescens* (*Cinchona succirubra*), of *C. calisaya*, of *C. ledgeriana*, or of its varieties or hybrids. It contains a minimum of 6.5% of total alkaloids, of which 30 to 60% are quinine-type alkaloids. It has an intensely bitter, somewhat astringent taste. Protect from light.

Profile

Cinchona contains a number of alkaloids, including two pairs of optical isomers: quinine (p.612) and quinidine, (p.1383) and cinchonine and cinchonidine. Cinchona alkaloids have long been used for their antimalarial activity either singly, as quinine or quinidine, or in mixtures, such as totaquine. Quinidine is also used for its antiarrhythmic properties.

Cinchona bark is used as a bitter and is also employed in herbal remedies.

Homoeopathy. Cinchona bark has been used in homoeopathic medicines under the following names: Cinchonae cortex; China; China pubescens; China rubra; Cinchora succirubra; China officinalis; Cinchona officinalis; Cinc. of.

Preparations

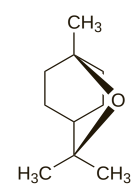
Cineole

Cajuputol; Cineol; Cineolas; Cinéole; Cineolum; Cyneol; Eucaliptol; Eucalyptol *(USAN)*; Eucalyptolum; Sineoli. 1,8-Epoxy-*p*-menthane; 1,3,3-Trimethyl-2-oxabicyclo[2.2.2]octane.

$C_{10}H_{18}O$ = 154.2.
CAS — 470-82-6.



Description. Cineole is a colourless liquid, with an aromatic camphoraceous odour, obtained from eucalyptus oil, cajuput oil, and other oils.

Pharmacopoeias. In *Eur.* (see p.vii), *US*, and *Viet.*
Ph. Eur. 6.2 (Cineole). A clear colourless liquid. It solidifies at about 0.5°. Practically insoluble in water; miscible with alcohol and with dichloromethane. Store in airtight containers. Protect from light.
USP 31 (Eucalyptol). It is obtained from eucalyptus oil and from other sources. Store in airtight containers.

Profile

Cineole has the actions and uses of eucalyptus oil (p.2301). It has been used in counter-irritant ointments and in dental products. It has also been used in nasal preparations, but oily solutions inhibit ciliary movement and may cause lipoid pneumonia. Preparations containing cineole with other volatile substances have been used in the treatment of renal and biliary calculi.

Multi-ingredient: ***Arg.:*** Aseptobron; Aseptobron Ampicilina†; Aseptobron N; Atomo Desinflamante; Atomo Desinflamante Familiar; Atomo Desinflamante G; Bano Liquido con Eucalipto†; Bronco Etersan; Di-Neumobron; Listerine Clasico; Listerine Cool Mint; Listerine Fresh Burst; No-Tos Adultos; Otorinazol†; Refenax Caramelos Expectorantes; ***Austral.:*** Bosisto's Vaporising Ointment; Euky Bearub; Methyl Salicylate Ointment Compound†; Nasex; Spray-Tish Menthol; Tixylix Chest Rub†; Vasylox†; Vicks Sinex; ***Austria:*** Rhinospray Plus; Rowachol; Rowatinex; Wick Sinex; ***Belg.:*** Balsoclase Expectorans; Eucalyptine; Eucalyptine Le Brun†; Eucalyptine Pholcodine; Eucalyptine Pholcodine Le Brun†; Inhalene†; Inhalo Rhinathiol; Inopectol; Olbas; Pulmex; Pulmex Baby; ***Braz.:*** Algice; Angino-Rub; Baldin-CE†; Bromil; Broncopinol†; Canfomenol†; Eucaliptan†; Fluomint; Gargotan†; Gripanil†; Gripomatine†; Griponia†; Gripsay; Inhadrina†; Inhalante Yatropan; Killgrip†; Mentalol†; Ozonyl; Ozonyl Aquoso; Ozonyl Expectorante; Pastilhas Valda; Pectal†; Penetro; Quelodin†; Tabletes Valda†; Tetrapulmo; Transpulmin; Transpulmin Balsamo; Transpulmin†; Tripulmin Balsamico†; Tripulmin†; Valda†; Vick Pastilhas; ***Canad.:*** Alsirub†; Antiseptic Mouthwash; Arthriflex; Cal Mo Dol; Carboseptol†; Demo-Cineol; Listerine; Listerine Antiseptic Tartar Control; Mielocol; Mouthwash Antiseptic & Gargle†; Physio-Rub; Thermo Rub; Valda; ***Chile:*** Listerine; Oralfresh Citrus; Oralfresh Clasico; Rowatinex; ***Cz.:*** Biocalyptol S†; Rowachol; Rowatinex; ***Denm.:*** Otrivin Menthol; ***Fin.:*** Otrivin Menthol; ***Fr.:*** Biolau; Dinacode avec codeine†; Dinacode†; Essence Algerienne; Eucalyptine; Eucalyptine Le Brun; Hexapneumine; Listerine; Listerine protection dents et gencives; Neo-Codion†; Pectoderme†; Pholcones Bismuth; Pulmofluide Simple; Valda; Vegebom; ***Ger.:*** Eufimenth-Balsam N†; Rhinospray Plus; Rhinospray sensitiv; Rowachol; Rowachol comp†; Rowachol-Digestiv; Rowatinex; Transpulmin Balsam; ***Gr.:*** Cedovix; Faragel-Forte; ***Hong Kong:*** Biocalyptol†; Cool Mint Listerine; Listerine; Listerine Tartar Control; Listerine Teeth and Gum Defence; Neo-Rowachol; Neo-Rowatinex; Rowachol; Rowatinex; Valda†; ***Hung.:*** Rhinospray Plus; Rowachol; Rowatinex; ***India:*** Dristan Nasal Drops; Endrine; Endrine Mild; Karvol Plus; Sinarest Vapocaps; ***Indon.:*** Dactylen; Listerine; Listerine Coolmint; ***Irl.:*** Rowachol; Rowatinex; Valda†; ***Israel:*** Gargol; Rowachol; Rowatinex; ***Ital.:*** Abiostil; Balsamico; Balta Intimo†; Calyptol; Lipobalsamo; Listerine Fresh Citrus; Listerine Tartar Control; Paidorinovit; Pastiglie Valda†; Pulmarin; Pumilene Vapo; Rinogutt Eucalipto-Fher; Rinovit; Transpulmina Gola; Transpulmina Tosse; Vicks Baby Balsam†; Vicks Sinex; ***Malaysia:*** Listerine†; Purporent†; Rowachol; Rowatinex; ***Mex.:*** Andociclina Balsamica†; Bronkitose Mielimon; Cholex; Eucalin†; Guayalin; Guayalin-Plus†; Iodex Cristal; Listerine; Numonyl†; ***Neth.:*** Balsoclase Compositum; Balsoclase-E; Otrivin Menthol; Rhinospray met menthol; ***NZ:*** Listerine; Listerine Tartar Control; Tixylix Chest Rub; Vicks Sinex; ***Philipp.:*** Kamillosan M; Listerine Coolmint; Listerine Fresh Citrus; Listerine Freshburst; Listerine Original; Listerine Tartar Control; Listerine Teeth & Gum Defense; Rhea Superscent Oil; Rowachol; Rowatinex; Transpulmin Balsam; ***Pol.:*** Rowachol; Rowatinex; Salviasept; Terpichol; ***Port.:*** Listerine†; Rectopulmo Adultos†; Rectopulmo Infantil†; Transpulmina; Valda†; ***Rus.:*** Nazol Advance (Назол Адванс); ***S.Afr.:*** Respisniffers; Woodwards Inhalant; ***Singapore:*** Listerine; Listerine Cool Mint; Listerine Fresh Burst; Listerine Tartar Control; ***Spain:*** Balsamo Kneipp†; Broncovital†; Brota Rectal Balsamico; Caltoson Balsamico; Caramelos Agua del Carmen†; Diminex Antitusigeno; Doctomitil†; Dolmitin; Eucalyptospirine†; Eupnol; Mentobox; Pastillas Juanola†; Pastillas Pectoral Kely; Piorlis; Pulmofasa; Retarpen Balsamico†; Rinobanedif; Rowachol; Rowanefrin; Sinus Inhalaciones; Tifell†; Trophires†; Vitavox Pastillas†; ***Swed.:*** Otrivin Menthol; ***Switz.:*** Nasobol N; Neo-Bronchol; Onguent aux herbes Keller; Rectoseptal-Neo bismuthe; Rectoseptal-Neo simple; Resorbane; Rowachol; Sedasept†; Sedotussin†; Transpulmin N; Vicks Sinex; ***Thai.:*** Dexalin; Hot Ize; Olympic Balm†; Rowachol; Rowatinex; Sore Mouth Gel; ***Turk.:*** Bugumentol; Bugusan; Buguseptil; Gelocaps; Mentimol; Mentolin; Mentoseptol; Otaci Oka Mentol; Otaci Salvia; Rinolar; Sulfarhin; ***UK:*** Dubam; Listerine Antiseptic Mouthwash; Lockets; Nostroline; Nowax; Rowachol; ***USA:*** Babee; BFI; Listerine; Pfeiffer's Cold Sore; Rid-a-Pain; Saratoga; Sting-Eze; ***Venez.:*** Derpinol†; Robitussin Caramelos†; Rowachol; Rowatinex; Transmin.

Cinnamedrine *(USAN, rINN)* ⊗

Cinamedrina; Cinnamédrine; Cinnamedrinum; *N*-Cinnamylephedrine. α-{1-[Methyl(3-phenyl-2-propenyl)amino]ethyl}benzenemethanol.

Циннамедрин

$C_{19}H_{23}NO = 281.4$.
CAS — 90-86-8.

Cinnamedrine Hydrochloride *(rINNM)* ⊗

Cinnamédrine, Chlorhydrate de; Cinnamedrini Hydrochloridum; *N*-Cinnamylephedrine Hydrochloride; Hidrocloruro de cinamedrina.

Циннамедрина Гидрохлорид

$C_{19}H_{23}NO,HCl = 317.9$.

Profile

Cinnamedrine hydrochloride is reported to have sympathomimetic actions resembling those of ephedrine. It was formerly used with analgesics in the symptomatic relief of dysmenorrhoea.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Chile:*** Tapal-2†.

Cinnamon

Canela; Canela do Ceilão; Cannelle dite de ceylan; Ceylon Cinnamon; Ceylonzimt; Cinamonų žievė; Cinnam.; Cinnamomi cortex; Cinnamon Bark; Fahéj; Kanel; Kaneli; Skořicovníková kůra; Zimt.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Cinnamon). The dried bark of the shoots of coppiced trees of *Cinnamomum zeylanicum* containing not less than 1.2% v/w of essential oil. It has a characteristic, aromatic odour. Protect from light.
The BP 2008 directs that when Powdered Cinnamon is prescribed or demanded, material containing not less than 1.0% v/w of essential oil shall be dispensed or supplied.

Profile

Cinnamon is carminative and slightly astringent and is included in some preparations for gastrointestinal disorders. It is also used as a flavour. It is a source of cinnamon oil (below).

Preparations

Ph. Eur.: Cinnamon Tincture;
USNF 26: Compound Cardamom Tincture.

Proprietary Preparations (details are given in Part 3)

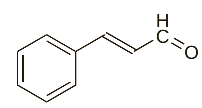
Multi-ingredient: ***Austria:*** Brady's-Magentropfen; China-Eisenwein; Mariazeller; Montana; ***Braz.:*** Balsamo Branco; Paratonico; ***Cz.:*** Blahungstee N†; Dr Theiss Rheuma Creme†; Dr Theiss Schwedenbitter; Klosterfrau Melisana; Magen- und Darmtee N†; Passedan; ***Fr.:*** Elixir Grez†; Quintonine; ***Ger.:*** Amara-Pascoe; Doppelherz Melissengeist†; Gastrosecur†; Majocarmin forte†; Melissengeist; Montana N; Schwedentrunk Elixier; Sedovent; ***India:*** Carmicide; ***Israel:*** Davilla; ***Ital.:*** Assenzio (Specie Composta)†; Biophase Shampoo; Dam; ***Jpn:*** The Guard Seichojo; ***Pol.:*** Reumpapai; ***Rus.:*** Doppelherz Melissa (Доппельгерц Мелисса); Himcolin (Химколин); ***S.Afr.:*** Melissengeist; Rooilavental; Spiritus Contra Tussim Drops; ***Spain:*** Agua del Carmen; Vigortonic; ***Switz.:*** Alcoolat de Melisse†; Baume†; Odontal; Tisane pour les problemes de prostate; ***Thai.:*** Carmicide†; Meloids; ***UK:*** Melissa Comp.; ***Venez.:*** Aftil.

Cinnamon Oil

Aetheroleum Cinnamomi Zeylanici; Canela, aceite esencial de; Cinnam. Oil; Esencia de Canela; Essence de Cannelle de Ceylan; Oleum Cinnamomi; Zimtöl.

Коричное Масло

CAS — 8015-91-6.



(cinnamaldehyde)

Pharmacopoeias. *Eur.* (see p.vii) includes oil from both the bark and the leaf of *Cinnamomum zeylanicum* (*C. verum*).
Cinnamon oil is also used as the name for cassia oil in some countries. For example, *Jpn* under the title Cinnamon Oil specifies oil from either *Cinnamomum cassia* or *Cinnamomum zeylanicum*.

Cinnamon Bark Oil

Cannelle dite de ceylan, huile essentielle de; Ceiloninių cinamonų žievės eterinis aliejus; Ceylon Cinnamon Bark Oil; Ceyloni fahéjfakéreg-olaj; Cinnamomi zeylanicii corticis aetheroleum; Cinnamomi Zeylanicii Corticus Aetheroleum; Kaneliöljy, Ceylonin; Kanelolja, ceylonesisk; Silice kůry skořicovníku cejlonského.

Коричное Масло Из Коры

Pharmacopoeias. In *Eur.* (see p.vii) and Jpn.
Ph. Eur. 6.2 (Cinnamon Bark Oil, Ceylon). The oil obtained by steam distillation of the bark of the shoots of *C. zeylanicum* (*C. verum*). It contains 55 to 75% of cinnamaldehyde and less than 7.5% of eugenol. A clear, mobile, light yellow liquid becoming reddish over time, with a characteristic odour of cinnamaldehyde. Store in well-filled airtight containers. Protect from light and heat.

Cinnamon Leaf Oil

Cannelier dit de ceylan (feuille de), huile essentielle de; Ceiloninių cinamonų lapų eterinis aliejus; Ceyloni fahéjfalevél-olaj; Cinnamomi zeylanici folii aetheroleum; Cinnamomi Zeylanici Folii Etheroleum; Kanelbladolja, ceylonesisk; Kanelinlehtiöljy, Ceylonin; Ol. Cinnam. Fol; Silice listu skořicovníku cejlonského.

Коричное Масло Из Листьев

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Cinnamon Leaf Oil, Ceylon). The oil obtained by steam distillation of the leaves of *C. zeylanicum* (*C. verum*). It contains less than 3% of cinnamaldehyde, and 70 to 85% of eugenol. A clear, mobile, reddish brown to dark brown liquid, with a characteristic odour of eugenol. Store in well-filled airtight containers. Protect from light and heat.

Profile

Cinnamon bark oil has properties and uses similar to those of cinnamon (above). It is also included in preparations for musculoskeletal and joint disorders and for respiratory-tract disorders. There have been a number of reports of hypersensitivity to cinnamaldehyde and other constituents of cinnamon oil. Cinnamon leaf oil has also been used, although the amounts of eugenol and cinnamaldehyde are different from the bark oil. Cinnamon bark or leaf oil is also used in aromatherapy.

Preparations

BP 2008: Aromatic Cardamom Tincture; Compound Cardamom Tincture; Concentrated Cinnamon Water; Tolu-flavour Solution.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Gartech; ***Austria:*** Tiger Balsam Rot; ***Braz.:*** Ovariusedan†; ***Canad.:*** Tiger Balm Red; Tiger Balm Ultra; ***Chile:*** Agua del Carmen; Agua Melisa Carminativa; ***Cz.:*** Amol; Tiger Balm Rot†; ***Fr.:*** Aromasol; Gouttes aux Essences; Resistim; Stomargil; Tigridol; ***Ger.:*** Amol Heilkrautergeist N; esto-gast; Melissengeist; Salviathymol N; ***Gr.:*** Tiger Balm; ***Hong Kong:*** Magesto; ***Hung.:*** Fagifor†; ***India:*** Bestozyme; Catazyme-P; Digeplex; Sensur; Vitazyme; ***Indon.:*** Corsabalm; ***Israel:*** Karvol; ***Ital.:*** Relaxcol; Valda Propoli; ***NZ:*** Karvol; ***Pol.:*** Amol; Argol Essenza Balsamica; Argol Grip; Argol Rheuma; Aromatol; Carmolis; ***Rus.:*** Efcamon (Эфкамон); ***S.Afr.:*** Enterodyne; Karvol; ***Singapore:*** Karvol; ***Spain:*** Depurativo Richelet; ***Switz.:*** Baume de Chine Temple of Heaven blanc; Carmol; Pirom; Sansilla; Spagyrom; ***Thai.:*** Magesto; Mesto-Of; ***UK:*** Slippery Elm Stomach Tablets.

Citicoline *(pINN)*

CDP-Choline; Citicolina; Citicolinum; Citidoline; Cytidine Diphosphate Choline; Cytidine diphosphocholine; IP-302. Choline cytidine-5′-pyrophosphate.

Цитиколин

$C_{14}H_{26}N_4O_{11}P_2 = 488.3$.
CAS — 987-78-0.
ATC — N06BX06.
ATC Vet — QN06BX06.

Citicoline Sodium *(USAN, pINNM)*

Citicolina sódica; Citicoline Sodique; Natrii Citicolinum. Cytidine 5′-{sodium *P*′-[2-(trimethylammonio)-ethyl] hydrogen diphosphate}, inner salt.

Натрий Цитиколин

$C_{14}H_{25}N_4NaO_{11}P_2 = 510.3$.
CAS — 33818-15-4.

Pharmacopoeias. In *Chin.*

Profile

Citicoline is a derivative of choline and cytidine that is involved in the biosynthesis of lecithin. It is claimed to increase blood flow and oxygen consumption in the brain and has been given in the treatment of cerebrovascular disorders (including ischaemic stroke, p.1185), parkinsonism, and head injury. It is given by intravenous or intramuscular injection in doses of up to 1 g daily or orally in divided doses of 200 to 600 mg daily.

Citicoline sodium has also been used.

Cerebrovascular disorders. Citicoline has shown some short- to medium-term benefit for disturbances of memory and behaviour associated with cerebrovascular disorders.[1]

1. Fioravanti M, Yanagi M. Cytidinediphosphocholine (CDP choline) for cognitive and behavioural disturbances associated with chronic cerebral disorders in the elderly. Available in The Cochrane Database of Systematic Reviews; Issue 2. Chichester: John Wiley; 2005 (accessed 09/05/06).

Strabismus. Experimental studies have shown that centrally-acting drugs such as citicoline may improve vision in patients with amblyopia (see Strabismus, p.1874). However, their role in clinical practice remains to be established.[1]

1. Chatzistefanou KI, Mills MD. The role of drug treatment in children with strabismus and amblyopia. *Paediatr Drugs* 2000; **2:** 91–100.

Preparations

Proprietary Preparations (details are given in Part 3)

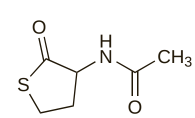
Multi-ingredient: ***Arg.:*** Neuriclor Vascular†; Nimodilat Plus; Nimoreagin; Nivas Plus; Reagin Vascular.

Citiolone *(rINN)*

BO-714; Citiolona; Citiolonum. *N*-(Perhydro-2-oxo-3-thienyl)acetamide.

Цитиолон

$C_6H_9NO_2S = 159.2$.
CAS — 1195-16-0.
ATC — A05BA04.
ATC Vet — QA05BA04.



Profile

Citiolone has been used in the treatment of hepatic disorders and as a mucolytic. Hypersensitivity reactions have been reported.

Multi-ingredient: *Spain:* Hubergrip†.

Citral

Cytral. 3,7-Dimethyl-2,6-octadienal.

$C_{10}H_{16}O$ = 152.2.

CAS — 5392-40-5 (citral); 141-27-5 (geranial); 106-26-3 (neral).

Profile

Citral is a terpenoid constituent of lemon oil (p.2332), lemon grass oil (p.2333), melissa oil (p.2339), and many other essential oils; it exists as 2 isomers, *trans*-citral (geranial) and *cis*-citral (neral). It has been used in preparations for respiratory-tract, musculoskeletal, and other disorders. It is also used as a flavour and perfume.

Hypersensitivity. References.

1. Heydorn S, *et al.* Citral a fragrance allergen and irritant. *Contact Dermatitis* 2003; **49:** 32–6.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: *Fr.:* Bronchorectine au Citral; ***Switz.:*** Carmol Plus†.

Anhydrous Citric Acid

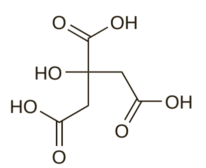
Acidum Citricum; Acidum citricum anhydricum; Cítrico anhidro, ácido; Citrinų rūgštis, bevandenė; Citrique (acide) anhydre; Citronensäure; Citronsyra, vattenfri; E330; Kyselina citronová; Sitruunahappo, vedetön; Vízmentes citromsav. 2-Hydroxypropane-1,2,3-tricarboxylic acid.

$C_6H_8O_7$ = 192.1.

CAS — 77-92-9.

ATC — A09AB04.

ATC Vet — QA09AB04.



Pharmacopoeias. In *Eur.* (see p.vii), *Int.*, *Jpn*, and *US.*

Ph. Eur. 6.2 (Citric Acid, Anhydrous). Colourless crystals or granules or a white or almost white crystalline powder. Very soluble in water; freely soluble in alcohol.

USP 31 (Anhydrous Citric Acid). Colourless, translucent crystals, or a white, granular to fine, crystalline powder. Soluble 1 in 0.5 of water, 1 in 2 of alcohol, and 1 in 30 of ether. Store in airtight containers.

Citric Acid Monohydrate

Ácido del Limón; Acidum citricum monohydricum; Cítrico monohidrato, ácido; Citrinų rūgštis monohidratas; Citrique (acide) monohydraté; Citromsav-monohidrát; Citronsyramonohydrat; Hydrous Citric Acid; Kwas cytrynowy jednowodny; Kyselina citronová monohydrát; Sitruunahappomonohydraatti.

$C_6H_8O_7,H_2O$ = 210.1.

CAS — 5949-29-1.

ATC — A09AB04.

ATC Vet — QA09AB04.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Int., Jpn, US,* and *Viet.*

Ph. Eur. 6.2 (Citric Acid Monohydrate). Efflorescent, colourless crystals or granules, or a white or almost white crystalline powder. Very soluble in water; freely soluble in alcohol. Store in airtight containers.

USP 31 (Citric Acid Monohydrate). Colourless, translucent crystals, or a white, granular to fine, crystalline powder. It is efflorescent in dry air. Soluble 1 in 0.5 of water, 1 in 2 of alcohol, and 1 in 30 of ether. Store in airtight containers.

Adverse Effects and Precautions

Citric acid ingested frequently or in large quantities may cause erosion of the teeth and have a local irritant action.

Interactions

Aluminium hydroxide. Intestinal absorption of aluminium ions may be enhanced by oral doses of citrates. Caution is needed in patients with chronic renal disease receiving aluminium hydroxide as a phosphate binder who are given a calcium supplement in the form of effervescent tablets that contain citric acid.[1]

1. Mees EJD, Başçi A. Citric acid in calcium effervescent tablets may favour aluminium intoxication. *Nephron* 1991; **59:** 322.

Uses and Administration

Citric acid is used in effervescing mixtures; the monohydrate is used in the preparation of effervescent granules.

Citric acid monohydrate is used as a synergist to enhance the effectiveness of antoxidants.

Preparations containing citric acid are used in the management of dry mouth (p.2140) and to dissolve renal calculi, alkalinise the urine, and prevent encrustation of urinary catheters. Citric acid is an ingredient of citrated anticoagulant solutions. Citric acid has also been used in preparations for the treatment of coughs, gastrointestinal disturbances, and metabolic acidosis.

Preparations

BP 2008: Lemon Syrup; Paediatric Compound Tolu Linctus; Paediatric Simple Linctus; Potassium Citrate Mixture; Simple Linctus;
Ph. Eur.: Anticoagulant Acid-Citrate-Glucose Solutions (ACD); Anticoagulant Citrate-Phosphate-Glucose Solution (CPD);
USP 31: Anticoagulant Citrate Dextrose Solution; Anticoagulant Citrate Phosphate Dextrose Adenine Solution; Anticoagulant Citrate Phosphate Dextrose Solution; Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation; Magnesium Carbonate and Citric Acid for Oral Solution; Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution; Magnesium Citrate Oral Solution; Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution; Potassium Citrate And Citric Acid Oral Solution; Sodium Citrate and Citric Acid Oral Solution; Tricitrates Oral Solution.

Citronella Oil

Citrinžolių eterinis aliejus; Citronela, aceite esencial de; Citronellae aetheroleum; Citronellae Etheroleum; Citronellaolaj; Citronellolja; Citronelová silice; Citronnelle, huile essentielle de; Oleum Citronellae; Sitronellaöljy.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Citronella Oil). The oil obtained by steam distillation from the fresh or partially dried aerial parts of *Cymbopogon winterianus*. It contains 30.0 to 45.0% citronellal, 9.0 to 15.0% citronellol, 2.0 to 4.0% citronellyl acetate, less than 2.0% geranial, 20.0 to 25.0% geraniol, 3.0 to 8.0% geranyl acetate, 1.0 to 5.0% limonene, and less than 2.0% neral. A pale yellow to brownish-yellow liquid with a very strong odour of citronellal. Store in well-filled containers. Protect from light.

Profile

Citronella oil is used as a perfume and insect repellent. It is also used in aromatherapy. Hypersensitivity has been reported.

Preparations

Proprietary Preparations (details are given in Part 3)

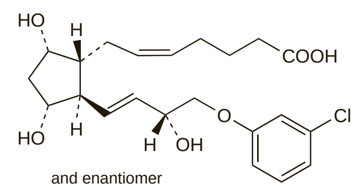
Cloprostenol Sodium *(BANM, USAN, rINNM)*

Cloprostenol sódico; Cloprosténol sodique; Cloprostenoli natricum; ICI-80996; Natrii Cloprostenolum. Sodium (±)-(*Z*)-7-{(1*R*,2*R*,3*R*,5*S*)-2-[(*E*)-(3*R*)-4-(3-chlorophenoxy)-3-hydroxybut-1-enyl]-3,5-dihydroxycyclopentyl}hept-5-enoate.

Натрий Клопростенол

$C_{22}H_{28}ClNaO_6$ = 446.9.

CAS — 40665-92-7 (cloprostenol); 55028-72-3 (cloprostenol sodium).



(cloprostenol)

Pharmacopoeias. In *BP(Vet).*

BP(Vet) 2008 (Cloprostenol Sodium). A white or almost white amorphous hygroscopic powder. Freely soluble in water, in alcohol, and in methyl alcohol; practically insoluble in acetone. Protect from light and moisture.

Profile

Cloprostenol is a synthetic analogue of dinoprost (prostaglandin F_2). The sodium salt is used as a luteolytic in veterinary medicine.

Clove

Caryoph.; Caryophylli flos; Caryophyllum; Clavo; Clou de girofle; Cloves; Cravinho; Cravo-da-Índia; Gewürznelke; Giroflier; Gvazdikėliai; Hřebíčkovcový květ; Kryddnejlika; Mausteneilikka; Szegfűszeg; Tropical Myrtle.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *Jpn.*

Ph. Eur. 6.2 (Clove). The whole flower buds of *Syzygium aromaticum* (*Eugenia caryophyllus*), containing not less than 15% v/w of volatile oil, dried until they become reddish-brown, and with a characteristic aromatic odour. Protect from light.

The BP 2008 directs that when Powdered Clove is prescribed or demanded, material containing not less than 12.0% v/w of essential oil shall be dispensed or supplied.

Profile

Clove is a carminative and is used as a flavour. It is the source of clove oil (below).

Clove and clove oil have been abused in the form of cigarettes.

Abuse. Smoking of cigarettes composed of a mixture of tobacco and cloves is a habit that originated in Indonesia and has spread to the USA. There have been reports of severe and sometimes fatal respiratory illness related to smoking clove cigarettes and there is also evidence from *animal* studies that clove cigarette smoke and eugenol (the principal constituent of clove oil) have harmful pulmonary effects. The Council on Scientific Affairs of the American Medical Association considers that in addition to the hazards associated with smoking tobacco, clove cigarettes may also produce severe lung injury in certain susceptible individuals and could also induce pulmonary aspiration in healthy individuals due to diminution of the gag reflex produced by the local anaesthetic action of eugenol.[1] The American Academy of Pediatrics has also alerted paediatricians in the USA to clove-cigarette smoking by young people and warned of the risks.[2]

2. Committee on Substance Abuse. Hazards of clove cigarettes. *Pediatrics* 1991; **88:** 395–6.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Mariazeller; ***Braz.:*** Balsamo Branco; ***Cz.:*** Klosterfrau Melisana; Naturland Grosser Swedenbitter†; Stomatosan†; ***Ger.:*** Doppelherz Melissengeist†; Inconturina†; Melissengeist; ***Ital.:*** Biophase Shampoo; Promix†; Saugella Uomo; ***Port.:*** Midro†; ***Rus.:*** Doppelherz Melissa (Доппельгерц Мелисса); Maraslavin (Мараславин); Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера); ***S.Afr.:*** Clairo; Melissengeist; Spiritus Contra Tussim Drops; ***Switz.:*** Alcoolat de Melisse†; Odontal; Tisane pour les problemes de prostate; ***UK:*** Melissa Comp.; Revitonil.

Clove Oil

Caryophylli floris aetheroleum; Caryophylli Floris Etheroleum; Clavo, aceite esencial de; Clou de girofle, huile essentielle de; Esencia de Clavo; Essence de Girofle; Gvazdikėlių eterinis aliejus; Neilikkaöljy; Nejlikolja; Nelkenöl; Ol. Caryoph.; Oleum Caryophylli; Silice hřebíčkovcového květu; Szegfűszegolaj.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.* Also in *USNF.*

Ph. Eur. 6.2 (Clove Oil). A clear yellow liquid obtained by steam distillation from clove containing 75.0 to 88.0% of eugenol. It becomes brown on exposure to air. Miscible with dichloromethane, with toluene, and with fatty oils. Store in well-filled airtight containers. Protect from light and heat.

USNF 26 (Clove Oil). The volatile oil distilled with steam from clove. It contains not less than 85.0% of phenolic substances, chiefly eugenol. Soluble 1 in 2 of alcohol (70%). Store in well-filled airtight containers.

Incompatibility. PVC bottles softened and distorted fairly rapidly in the presence of clove oil, which should not be stored or dispensed in such bottles.[1]

1. Department of Pharmaceutical Sciences of the Pharmaceutical Society of Great Britain. Plastics medicine bottles of rigid PVC. *Pharm J* 1973; **210:** 100.

Profile

Clove oil is a carminative that is sometimes used in the treatment of flatulent colic. It is also used as a flavour.

Applied externally clove oil is irritant but can produce local anaesthesia. It is used as a domestic remedy for toothache, a plug of cotton wool soaked in the oil being inserted in the cavity of the carious tooth; repeated application may damage the gingival tissues. Mixed with zinc oxide, it is used as a temporary anodyne dental filling, although eugenol (p.2301), one of its constituents, is often preferred. Clove oil is included as a counter-irritant in preparations for musculoskeletal and joint disorders. It is also used in aromatherapy.

Eugenol may cause hypersensitivity.

Adverse effects. Severe toxicity after ingestion of clove oil by young children has been reported.[1-4] Adverse effects included coma, acidosis, a generalised seizure, disordered blood clotting, and acute liver damage.

For reference to the harmful effects of smoking clove cigarettes, see under Clove, above.

Red Clover

Cow Clover; Meadow Clover; Purple Clover; Trébol rojo; Trefoil.

Pharmacopoeias. In *US*, which also includes the powdered form and powdered extract.

USP 31 (Red Clover). The dried inflorescence of *Trifolium pratense* (Fabaceae). It contains not less than 0.5% of isoflavones, calculated on the dried basis as the sum of daidzein (p.2391), genistein (p.2391), formononetin, and biochanin A. Protect from light and moisture.

Profile

The flowerheads of red clover have been used in herbal medicine. The isoflavones present in red clover have been investigated, similarly to other phytoestrogens, for their potential endocrine effects.

Preparations

USP 31: Red Clover Tablets.

Proprietary Preparations (details are given in Part 3)

Austral.: Promensil; Trinovin; ***Braz.:*** Climadil; Clinet; ***Indon.:*** Promeno; ***UK:*** Menoflavon.

Cobalt Chloride

Cloruro cobaltoso; Cobalto, cloruro de; Cobaltous Chloride; Kobaltu(II) chlorek.

$CoCl_2,6H_2O$ = 237.9.

CAS — 7646-79-9 (anhydrous cobalt chloride); 7791-13-1 (cobalt chloride hexahydrate).

Adverse Effects

Reactions to cobalt have included anorexia, nausea and vomiting, diarrhoea, precordial pain, cardiomyopathy, flushing of the face and extremities, skin rashes, tinnitus, temporary nerve deafness, renal injury, diffuse thyroid enlargement, and hypothyroidism. In large doses it may reduce the production of erythrocytes.

◊ References.

1. Kennedy A, *et al.* Fatal myocardial disease associated with industrial exposure to cobalt. *Lancet* 1981; **i:** 412–4.
2. Cugell DW, *et al.* The respiratory effects of cobalt. *Arch Intern Med* 1990; **150**: 177–83.
3. Evans P, *et al.* Cobalt and cobalt compounds. *Toxicity Review 29.* London: HMSO, 1993.

Uses and Administration

Cobalt chloride, when given to both normal and anaemic subjects, produces reticulocytosis and a rise in the erythrocyte count. This property suggested its use in the treatment of certain types of anaemia, but its general therapeutic use is, however, unjustified and not without danger.

In veterinary medicine, cobalt chloride has been given as a dietary supplement to ruminants.

Cobalt Oxide

Cobalto, óxido de; Tetraóxido de tricobalto; Tricobalt Tetroxide.

Co_3O_4 = 240.8.

CAS — 1308-06-1.

Pharmacopoeias. In *BP(Vet).*

BP(Vet) 2008 (Cobalt Oxide). It consists of cobalt (II, III) oxide (tricobalt tetroxide) with a small proportion of cobalt (III) oxide (dicobalt trioxide). A black powder. Practically insoluble in water; dissolves in mineral acids and in solutions of alkali hydroxides.

Profile

Cobalt oxide is used in veterinary practice for the prevention of cobalt deficiency in ruminants. The chloride and sulfate have been used similarly. For the adverse effects of cobalt, see Cobalt Chloride, above.

Coccidioidin

Coccidioidina.

Pharmacopoeias. In *US.*

USP 31 (Coccidioidin). A sterile solution containing the antigens obtained from the byproducts of mycelial growth or from the spherules of the fungus *Coccidioides immitis*; it contains a suitable antimicrobial. A clear, practically colourless or amber-coloured liquid. Store at 2° to 8°. Any dilutions should be stored at 2° to 8° and used within 24 hours. The expiry date is not later than 3 years (mycelial product) or 18 months (spherule-derived product) after release from the manufacturer's cold storage.

Profile

Coccidioidin has been used as an aid to the diagnosis of coccidioidomycosis and, in conjunction with other antigens, to assess the status of cell-mediated immunity. A usual dose of 0.1 mL of a 1 in 100 dilution by intradermal (intracutaneous) injection has been used.

Preparations

USP 31: Coccidioidin.

Proprietary Preparations (details are given in Part 3)

USA: Spherulin.

Cocoyl Caprylocaprate

Coco-Caprylate/Caprate; Cocoyle, caprylocaprate de; Cocoylis caprylocapras; Cocoylis Octanodecanoas; Kokoilo kaprilokapratas; Kokoyl oktanodekanoát; Kokoylkaprylokaprat; Kokoyylikaprylokapraatti; Kókuszalkoholok kaprilátjai és kaprátjai.

CAS — 95912-86-0.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Cocoyl Caprylocaprate). A mixture of esters of saturated C_{12} to C_{18} alcohols with caprylic (octanoic) and capric (decanoic) acids obtained by the reaction of these acids with vegetable saturated fatty alcohols. Relative density about 0.86. Viscosity about 11 mPa s. A slightly yellowish liquid. Practically insoluble in water; miscible with alcohol and with liquid paraffin.

Profile

Cocoyl caprylocaprate is used as an emollient.

Coenzyme A

CoA; CoASH; Coenzima A. 5′-*O*-{3-Hydroxy-3-[2-(2-mercaptoethylcarbamoyl)ethylcarbamoyl]-2,2-dimethylpropyl}adenosine-3′-dihydrogenphosphate-5′-trihydrogendiphosphate.

$C_{21}H_{36}N_7O_{16}P_3S$ = 767.5.

CAS — 85-61-0.

Profile

Formed from adenosine triphosphate, cysteine, and pantothenic acid, coenzyme A is involved in the body in many physiological roles, including the formation of citrate, the oxidation of pyruvate, the oxidation and synthesis of fatty acids, the synthesis of triglycerides, cholesterol, and phospholipids, and the acetylation of amines, choline, and glucosamine. It has been given by injection in a variety of metabolic disorders.

Cogalactoisomerase Sodium

Cogalactoisomerasa sódica; UDPG; Uridine-5′-diphosphoglucose Sodium.

$C_{15}H_{22}N_2Na_2O_{17}P_2,3H_2O$ = 664.3.

CAS — 133-89-1 (cogalactoisomerase).

Profile

Cogalactoisomerase sodium has been used in various hepatic disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Ital.: Bivitox†; Epatoxil†; Liverasi†; Toxepasi†.

Colforsin *(USAN, rINN)*

Boforsin; Colforsina; Colforsine; Colforsinum; Forscolin; Forskolin; HL-362; L-75-1362B. (3*R*,4a*R*,5*S*,6*S*,6a*S*,10*S*,10a*R*,10b*S*)-Dodecahydro-5,6,10,10b-tetrahydroxy-3,4a,7,7,10a-pentamethyl-3-vinyl-1*H*-naphtho[2,1-*b*]pyran-1-one, 5-acetate.

Кольфорсин

$C_{22}H_{34}O_7$ = 410.5.

CAS — 66575-29-9.

Colforsin Daropate Hydrochloride *(rINNM)*

Colforsin Dapropate Hydrochloride; Colforsine, Chlorhydrate de Daropate de; Colforsini Daropatis Hydrochloridum; Hidrocloruro del daropato de colforsina; NKH-477.

Колфорсина Даропата Гидрохлорид

$C_{27}H_{43}NO_8,HCl = 546.1.$

CAS — 138605-00-2.

Profile

Colforsin is an adenylate cyclase stimulator derived from the plant *Plectranthus barbatus* (*Coleus forskohlii*) (Labiatae). It has been investigated for a number of conditions, including glaucoma and impotence. It is reported to have positive inotropic and bronchodilator effects. It has been used in the form of colforsin daropate hydrochloride.

Preparations

Proprietary Preparations (details are given in Part 3)
Jpn: Adehl.

Collagen

Colágeno.

ATC — B02BC07; G04BX11.

ATC Vet — QB02BC07; QG04BX11.

Pharmacopoeias. *US* includes Bovine Acellular Dermal Matrix.

USP 31 (Bovine Acellular Dermal Matrix). A remodelable collagen scaffold derived from fetal or neonatal bovine skin. It is presented as a flat white sheet that is cut to size and hydrated in sterile saline solution prior to implantation. It is utilised as a structural scaffold in orthopaedic, neurosurgical, urogynaecological, dermatological, plastic, and other reconstructive procedures. The source fetal or neonatal bovine skin is mechanically and chemically processed to isolate the dermis and remove cells and cellular components. To prevent the transmission of infectious disease, the manufacturing process is validated to inactivate viruses potentially present in the source material. To prevent the spread of transmissible spongiform encephalopathies, the source material is acquired from appropriate geographic locations. Store at 15° to 30°.

Profile

Collagen is a fibrous protein component of mammalian connective tissue making up almost one third of the total body protein.

Collagen, processed in a variety of ways, has been used in surgery as a haemostatic and as a repair and suture material. For cosmetic purposes it has been injected into the dermis to correct scars and other contour deformities of the skin. Collagen implants have been used to block tear outflow in the management of dry eye (p.2140).

Intraurethral administration of collagen has been used in the treatment of stress incontinence (p.2180). There has also been interest in the use of collagen by mouth to suppress the inflammatory process in rheumatoid arthritis (p.11), osteoarthritis (p.11), and scleroderma (p.1817).

Elastin, another component of connective tissue, is an ingredient, often with collagen, of various topical preparations promoted for skin disorders.

Collagenase

Clostridiopeptidas; Clostridiopeptidase A; Clostridiopeptidasum A; Colagenasa; Klostridiopeptidaasi A.

CAS — 9001-12-1.

ATC Vet — QD03BA02.

Profile

Collagenase is a proteolytic enzyme derived from the fermentation of *Clostridium histolyticum* and has the ability to break down collagen. Preparations containing collagenase are used topically for the debridement of dermal ulcers and burns, and possibly other necrotic lesions, to facilitate granulation and epithelialisation. It has also been given by injection into the intervertebral disc for chemonucleolysis in the treatment of lumbar disc herniation (see low Back Pain, p.7). Collagenase is under investigation for use in Dupuytren's disease and Peyronie's disease.

Hypersensitivity reactions may occur. Local burning, erythema, and pain have been reported at the site of application. It has been suggested that debridement of infected wounds may increase the risk of bacteraemia and that patients should be watched for signs of systemic bacterial infection. The activity of collagenase may be reduced by antiseptics containing detergents, hexachlorophene, and heavy metal ions.

Collagenase potency is expressed in units based on the amount of enzyme required to degrade a standard preparation of undenatured collagen.

Chemonucleolysis. Collagenase has been studied as an alternative to chymopapain (p.2281) for chemonucleolysis because of the risk of anaphylaxis with the latter. Although early studies with collagenase reported benefit, there were also reports of back pain and muscle spasm.[1] Collagenase was not as effective as chymopapain in a comparative study,[2] and further study may be warranted before a firm recommendation can be made.

1. Brown MD. Update on chemonucleolysis. *Spine* 1996; **21** (24 suppl): 62S–68S.
2. Wittenberg RH, *et al.* Five-year results from chemonucleolysis with chymopapain or collagenase: a prospective randomized study. *Spine* 2001; **26:** 1835–41.

Dupuytren's disease. Collagenase has been reported to be of benefit in the treatment of Dupuytren's contracture.[1]

1. Badalamente MA, Hurst LC. Efficacy and safety of injectable mixed collagenase subtypes in the treatment of Dupuytren's contracture. *J Hand Surg (Am)* 2007; **32:** 767–74.

Peyronie's disease. Beneficial effects have been reported with intralesional collagenase in men with Peyronie's disease.[1-3]

Colophony

Colofonia; Coloph.; Colophane; Colophonium; Kalafuna; Kanifolija; Kolofoni; Kolofónium; Kolofonium; Resin; Resina Pini; Resina Terebinthinae; Rosin.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.*

Ph. Eur. 6.2 (Colophony). The residue remaining after distillation of the volatile oil from the oleoresin obtained from various species of *Pinus*. Translucent, pale yellow to brownish-yellow, angular, irregularly shaped, brittle, glassy pieces of different sizes the surfaces of which bear conchoidal markings. Do not reduce to a fine powder.

Profile

Colophony is an ingredient of some collodions and plaster-masses. It has been used as an ingredient of ointments and dressings for wounds and minor skin disorders. Skin sensitisation and allergic respiratory symptoms have been reported.

Hypersensitivity. Reviews.

1. Downs AM, Sansom JE. Colophony allergy: a review. *Contact Dermatitis* 1999; **41:** 305–10.

Comfrey

Boneset; Comfrey Root; Consolidae Radix; Consuelda; Symphytum.

NOTE. Boneset is also a common name used for *Eupatorium perfoliatum* (see p.2267).

Pharmacopoeias. *Br.* includes Symphytum Officinale Root for Homoeopathic Preparations and Symphytum Officinale Root, Ethanol. decoctum for Homoeopathic Preparations.

BP 2008 (Symphytum Officinale Root for Homoeopathic Preparations). The fresh root of *Symphytum officinale*.

BP 2008 (Symphytum Officinale Root, Ethanol. decoctum for Homoeopathic Preparations). The fresh root of *Symphytum officinale*.

Profile

Comfrey consists of the dried root and rhizome of *Symphytum officinale* (Boraginaceae); the leaf has also been used. It contains about 0.7% of allantoin, large quantities of mucilage, and some tannin. It may also contain pyrrolizidine alkaloids.

Comfrey was formerly used as an application to wounds and ulcers to stimulate healing and was also given systemically for gastric ulceration. It has been applied topically in the treatment of inflammatory disorders. The healing action of comfrey has been attributed to the presence of allantoin (p.1588).

There are reports of hepatotoxicity attributed to pyrrolizidine alkaloids present in comfrey preparations and such preparations have been withdrawn or banned in a number of countries.

Homoeopathy. Comfrey has been used in homoeopathic medicines under the following names: Symphytum officinale; Symph. of.

◊ References.

2. Grube B, *et al.* Efficacy of a comfrey root (Symphyti offic. radix) extract ointment in the treatment of patients with painful osteoarthritis of the knee: results of a double-blind, randomised, bicenter, placebo-controlled trial. *Phytomedicine* 2007; **14:** 2–10.
3. D'Anchise R, *et al.* Comfrey extract ointment in comparison to diclofenac gel in the treatment of acute unilateral ankle sprains (distortions). *Arzneimittelforschung* 2007; **57:** 712–16.

Adverse effects. Toxic pyrrolizidine alkaloids have been isolated from several species of comfrey plants including common comfrey (*Symphytum officinale*), prickly comfrey (*S. asperum*), and Russian comfrey (*S. uplandicum*). Ingestion of plants containing pyrrolizidine alkaloids is a common cause of hepatic veno-occlusive disease in developing countries[1] and pyrrolizidine alkaloid hepatotoxicity presumably due to comfrey has been reported in North America and Europe.[1,2] Pulmonary endothelial hyperplasia and carcinogenic activity have also been reported in *animals*.[1,2]

Complement Blockers

Inhibidores del complemento.

Блокаторы Комплемента

Profile

Complement is a group of plasma and cellular proteins contributing to the innate immune system and is so called because it complements the microbicidal action of antibodies. The complement system is activated by the antigen-antibody complex followed by a cascade reaction of complement proteins culminating in microbial cell lysis. Complement also plays a part in many other physiological processes and regulatory mechanisms are in place to prevent inflammatory damage to host tissues through the inappropriate activation of complement. Hereditary or acquired abnormalities of the complement system are associated with a variety of disorders depending on which part of the system is affected, and include recurrent infections, partial lipodystrophy, hereditary angioedema, paroxysmal nocturnal haemoglobinuria, non-specific vasculitis, glomerulonephritis, cardiovascular disease, rheumatoid arthritis, sepsis, asthma, acute respiratory distress syndrome, psoriasis, SLE, bullous pemphigoid, discoid lupus, and graft survival after solid organ transplantation.

A number of substances are used or are under investigation for their ability to block activation of the complement system:

- complement C1 esterase inhibitor (p.2287) is given as replacement therapy in the treatment of hereditary angioedema
- eculizumab (p.2299) is a monoclonal antibody that targets the terminal C5 protein of complement and is given in the treatment of paroxysmal nocturnal haemoglobinuria
- pexelizumab (p.2366) is a similar substance under investigation in patients undergoing coronary artery revascularisation procedures
- mirococept (APT-070, SCR1-3) is a derivative of soluble complement receptor type 1 (SCR1) under investigation for the prevention of post transplantation graft dysfunction
- TP-10, a form of SCR1 has also been investigated for respiratory disorders
- myristoylated-peptidyl-recombinant human CD59 is under investigation for paroxysmal nocturnal haemoglobinuria

Complement C1 Esterase Inhibitor

Inhibidor de la C1 esterasa.

С1-Ингибитор Комплемента

ATC — B02AB03.

ATC Vet — QB02AB03.

Profile

Complement C1 esterase inhibitor is an endogenous complement blocker (p.2286) that plays a role in regulation of the complement system. It is prepared from human plasma and given as replacement therapy in hereditary angioedema (p.1081), in which there is a deficiency of natural complement C1-esterase inhibitor. It is given for both short-term prophylaxis and treatment of acute life-threatening attacks by slow intravenous injection or infusion in typical doses of 500 units or, in severe cases, 1000 units. The dose may be repeated if necessary after a few hours.

A recombinant human complement C1 esterase inhibitor (rh C1INH) is under investigation.

◊ Complement C1 esterase inhibitor may be effective in both the prevention and treatment of acute hereditary angioedema.[1] It has also been tried in the management of other conditions including sepsis (see Septicaemia, p.190) and capillary leak syndrome.[2] It is under investigation for the treatment of pancreatitis and for use in allogeneic lung transplantation, thermal injury, and shock.[2] It is also being studied as a means of limiting reperfusion injury in patients with acute myocardial infarction.[3]

Condurango

Condurango Bark; Condurango cortex; Condurango, écorce de; Eagle-vine Bark.

Pharmacopoeias. In *Jpn* and *Swiss.*

Profile

Condurango, the dried stem bark of *Marsdenia condurango* (*Gonolobus condurango*) (Asclepiadaceae), has been used as a bitter.

Homoeopathy. Condurango has been used in homoeopathic medicines under the following names: Marsdenia cundurango; Cond.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Sigman-Haustropfen; ***Braz.:*** Camomila; Estomafitino†; ***Ger.:*** Majocarmin forte†; Nervogastrol N†; Pankreaplex Neu†; Pascopankreat; Pascopankreat novo†; ***Pol.:*** Herbaton; ***Switz.:*** Elixir tonique N; Padma-Lax; Padmed Laxan; Stomacine.

Congo Red

CI Direct Red 28; Colour Index No. 22120; Czerwień Kongo; Rojo Congo; Rubrum Congoensis. Disodium 3,3′-[biphenyl-4,4′-diylbis(azo)]bis[4-aminonaphthalene-1-sulphonate].

$C_{32}H_{22}N_6Na_2O_6S_2$ = 696.7.

CAS — 573-58-0.

Profile

Congo red is used as a stain in the diagnosis of amyloidosis. It causes amyloid in tissue samples to fluoresce under polarised light.

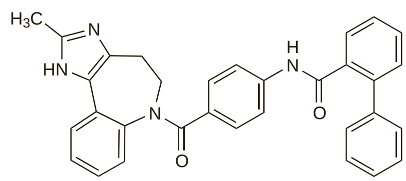
Conivaptan Hydrochloride *(rINNM)* ⊗

CI-1025; Conivaptan, Chlorhydrate de; Conivaptán, hidrocloruro de; Conivaptani Hydrochloridum; YM-087 (conivaptan or conivaptan hydrochloride). 4″-[(4,5-Dihydro-2-methylimidazo[4,5-*d*][1]benzazepin-6(1*H*)-yl)carbonyl]-2-biphenylcarboxanilide hydrochloride.

Кониваптана Гидрохлорид

$C_{32}H_{26}N_4O_2$,HCl = 535.0.

CAS — 210101-16-9 (conivaptan); 168626-94-6 (conivaptan hydrochloride).



(conivaptan)

Adverse Effects and Precautions

The most common adverse effects of conivaptan are infusion site reactions such as erythema, pain, phlebitis, and swelling, which are usually mild but can be severe enough in some patients that infusion must be stopped. Other adverse effects include atrial fibrillation, gastrointestinal disturbances, pyrexia, thirst, electrolyte disturbances, headache, and hypertension or hypotension.

Conivaptan is contra-indicated in hypovolaemic hyponatraemia, and is not indicated for the treatment of patients with congestive heart failure. Rapid correction of serum-sodium concentrations with conivaptan could increase the risk of osmotic demyelination syndrome. Conivaptan should be used with caution in hepatic or renal impairment because systemic exposure can be increased.

Interactions

As a substrate of the cytochrome P450 isoenzyme CYP3A4, concentrations of conivaptan can be increased by CYP3A4 inhibitors. The use of conivaptan with potent CYP3A4 inhibitors such as ketoconazole, itraconazole, clarithromycin, ritonavir, and indinavir is contra-indicated. Conivaptan itself is also a potent inhibitor of CYP3A4 and may increase the concentrations of other substrates of this isoenzyme, including amlodipine, midazolam, and simvastatin.

Conivaptan can reduce the clearance, and subsequently increase concentrations, of digoxin.

Pharmacokinetics

Conivaptan is metabolised by the cytochrome P450 isoenzyme CYP3A4, but inhibits its own metabolism. Using a regimen of intravenous loading dose followed by continuous infusion, concentrations of conivaptan initially decrease from the loading dose peak over about 12 hours, then gradually increase. After stopping the infusion, conivaptan has an elimination half-life of about 5 hours. Conivaptan is highly bound to plasma proteins.

Uses and Administration

Conivaptan hydrochloride is a vasopressin V_{1a} and V_2 receptor antagonist. In the management of hyponatraemia it acts mainly at V_2 receptors in the renal collecting ducts to increase the excretion of free water. It is used to treat euvolaemic and hypervolaemic hyponatraemia (p.1670), and is not indicated for congestive heart failure.

Conivaptan hydrochloride is given by intravenous infusion. To minimise infusion site irritation, it should be diluted in glucose 5% infusion (loading doses are given in 100 mL of fluid, the subsequent infusions in 250 mL) and given through a large vein; the infusion site should be changed every 24 hours. A loading dose of 20 mg is given over 30 minutes, followed by a continuous infusion of 20 mg over 24 hours. Treatment may be continued at a dose of 20 mg daily titrated to a maximum of 40 mg daily if required. The maximum duration of the infusion is 4 days. If a rapid rise in serum-sodium occurs (more than 12 mmol/litre in 24 hours) conivaptan should be stopped, and serum-sodium and neurological status should be carefully monitored because of the risk of osmotic demyelination syndrome. If hypovolaemia or hypotension develop, conivaptan should be stopped and volume status and vital signs should be monitored. Conivaptan may be resumed at a lower dose, if still indicated, when the rise in serum-sodium has stopped, if there is no evidence of adverse neurological effects and the patient is euvolaemic and no longer hypotensive.

Preparations

Proprietary Preparations (details are given in Part 3)

USA: Vaprisol.

Convallaria

Convalaria; Convallariae Herba; Lily of the Valley; Maiblume; Maiglöckchenkraut; May Lily; Muguet; Ziele konwalii.

CAS — 3253-62-1 (convallatoxol); 13473-51-3 (convalloside); 13289-19-5 (convallatoxoloside); 508-75-8 (convallatoxin).

Pharmacopoeias. In *Ger.* and *Pol.* (from *C. majalis* or closely related species).

Profile

Convallaria consists of the dried flowers, herb, or the rhizomes and roots of lily of the valley, *Convallaria majalis* (Liliaceae). Several crystalline glycosides have been obtained from the plant including convallarin, convalloside, convallatoxoloside, and convallatoxin.

Convallaria contains cardiac glycosides and has actions on the heart similar to those of digoxin (p.1259). Convallaria is used in herbal medicine.

Homoeopathy. Convallaria has been used in homoeopathic medicines under the following names: Convallaria majalis; Conval. m.

◊ *Convallaria majalis* has been designated unsafe for inclusion in foods, beverages, or drugs by the FDA in the USA.[1]

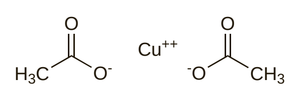
Copper Acetate

Cuivre, acétate de; Cupri acetas; Cupric Acetate; Kopparacetat; Kupariasetaatti; Miedzi(II) octan; Vario acetatas.

Ацетат Меди; Уксуснокислая Медь

$(C_2H_3O_2)_2Cu,H_2O$ = 199.6.

CAS — 142-71-2 (anhydrous).



Pharmacopoeias. *Eur.* (see p.vii) includes a form for homoeopathic preparations.

Ph. Eur. 6.2 (Copper Acetate Monohydrate for Homoeopathic Preparations; Cupri Acetas Monohydricus ad Praeparationes Homoeopathicas). Greenish-blue crystals or green powder. Soluble in water; slightly soluble or very slightly soluble in alcohol.

Profile

Copper acetate has been used in a variety of dermatological preparations. It is now more usually used complexed with a tripeptide in the form of prezatide copper acetate (p.1611). This acts as a source of ionic copper, which is needed by lysyl oxidase, a copper-dependent enzyme that has a crucial role in the crosslinking of collagen and elastin. For the nutritional and other uses of copper and its salts, see p.1936.

Homoeopathy. Copper acetate has been used in homoeopathic medicines under the following names: Cuprum aceticum; Cup. acet.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ital.:*** Verel; ***Mex.:*** Emplasto Monopolis.

Corbadrine (rINN) ⊗

Corbadrina; Corbadrinum; *l*-3,4-Dihydroxynorephedrine; Levonordefrin; *l*-Nordefrin. (−)-2-Amino-1-(3,4-dihydroxyphenyl)propan-1-ol.

Корбадрин

$C_9H_{13}NO_3$ = 183.2.

CAS — 829-74-3 (corbadrine); 6539-57-7 (nordefrin); 61-96-1 (nordefrin hydrochloride).

Pharmacopoeias. In *US.*

USP 31 (Levonordefrin). A white to buff-coloured, odourless, crystalline solid. Practically insoluble in water; slightly soluble in alcohol, in acetone, in chloroform, and in ether; freely soluble in aqueous solutions of mineral acids.

Profile

Corbadrine is a sympathomimetic (p.1407) that has been added to local anaesthetic preparations in dentistry to diminish absorption and to localise the effect; a concentration of 1 in 20 000 has been used.

Preparations

USP 31: Mepivacaine Hydrochloride and Levonordefrin Injection; Procaine and Tetracaine Hydrochlorides and Levonordefrin Injection; Propoxycaine and Procaine Hydrochlorides and Levonordefrin Injection.

Proprietary Preparations (details are given in Part 3)

Used as an adjunct in: ***Canad.:*** Polocaine†; ***USA:*** Carbocaine with Neo-Cobefrin; Isocaine; Polocaine.

Coriander

Coentro; Coriand.; Coriander Fruit; Coriander Seed; Coriandre; Coriandri fructus; Fruto del cilantro; Kalendrų vaisiai; Koriander; Koriandertermés; Koriandrový plod; Korianteri; Owoc kolendry.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Coriander). The dried cremocarp of *Coriandrum sativum*, containing not less than 0.3% v/w of essential oil, calculated with reference to the dried substance. Protect from light.

The BP 2008 directs that when Powdered Coriander is prescribed or demanded material containing not less than 0.2% v/w of essential oil shall be dispensed or supplied.

Profile

Coriander is the source of coriander oil (below). It is a carminative and is used as a flavour.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Salutaris; ***Austria:*** Brady's-Magentropfen; Mariazeller; Planta Lax; ***Braz.:*** Fitolax; Florlax; Fontolax; Frutalax†; Laxarine†; Laxtam; Naturetti; Sene Composta†; Tamaril; Tamarine; Tamarix†; ***Cz.:*** Abfuhr-Heilkrautertee†; Carminativum Babynos†; Hertz- und Kreislauftee†; ***Fr.:*** Mediflor Tisane Digestive No 3; ***Ger.:*** Carminativum Babynos†; Floradix Multipretten N; Gastrol S†; Presselin Dyspeptikum†; Ramend Krauter†; ***Ital.:*** Cadifen; Cadimint; Dicalmir; Tamarine; ***Mex.:*** Naturetti†; ***Pol.:*** Cholesol; Diges-Tonic; ***S.Afr.:*** Melissengeist; Spiritus Contra Tussim Drops; ***Spain:*** Agua del Carmen; Jarabe Manceau; Pruina; ***Switz.:*** Alcoolat de Melisse†; ***UK:*** Melissa Comp..

Coriander Oil

Cilantro, aceite esencial de; Coriandre, huile essentielle de; Coriandri aetheroleum; Coriandri Etheroleum; Kalendrų eterinis aliejus; Korianderolja; Koriandrová silice; Korianteriöljy; Ol. Coriand; Oleum Coriandri.

Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Coriander Oil). An essential oil obtained by steam distillation from the fruits of *Coriandrum sativum*. A clear colourless or pale yellow liquid, with the characteristic spicy odour. It contains not less than 65% and not more than 78% of linalol. Relative density 0.860 to 0.880. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

USNF 26 (Coriander Oil). The volatile oil obtained by steam distillation from coriander. Specific gravity 0.863 to 0.875. Soluble 1 in 3 of alcohol (70%). Store in airtight containers at a temperature not exceeding 40°. Protect from light.

Profile

Coriander oil is aromatic and carminative and is used as a flavour.

Preparations

BP 2008: Compound Orange Spirit; Compound Rhubarb Tincture;
USNF 26: Compound Orange Spirit.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ger.:*** Floradix Multipretten N; Gastricard†; Gastrysat; ***Ital.:*** Valda Propoli; ***Pol.:*** Argol Essenza Balsamica; Argol Grip; Argol Rheuma; ***Rus.:*** Espol (Эспол).

Corn Silk

Maíz, barba del; Stigma Maydis; Zea.

Pharmacopoeias. In *Fr.*

Profile

Corn silk, the stigma and style of maize (*Zea mays*) (Gramineae), has diuretic properties and is used for urinary-tract disorders including renal calculi.

Maize is widely used as a food and has also been used in herbal medicine.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Insadol; ***Switz.:*** Insadol; ***UK:*** Protat.

Multi-ingredient: ***Austral.:*** Althaea Complex; Urinase†; ***Pol.:*** Neopoldanen; ***Spain:*** Diurinat; Renusor†; ***UK:*** Elixir Damiana and Saw Palmetto.

Cottonseed Oil

Algodón, aceite de; Bomullsfröolja; Coton, huile de; Cotton Oil; Gossypii oleum; Gossypii Oleum Latin; Gyapotmagolaj; Ol. Gossyp. Sem.; Oléo de Algodoeiro; Oleum Gossypii Seminis; Puuvillansiemenöljy; Vilnamedžių aliejus.

CAS — 8001-29-4.

Pharmacopoeias. In *USNF*, which also includes hydrogenated cottonseed oil.

Eur. (see p.vii) includes only the hydrogenated oil.

Ph. Eur. 6.2 (Cottonseed Oil, Hydrogenated; Gossypii Oleum Hydrogenatum). Obtained by refining and hydrogenation of oil obtained from seeds of cultivated plants of various varieties of *Gossypium hirsutum* or of other species of *Gossypium*. It consists mainly of triglycerides of palmitic and stearic acids. It is a white or almost white mass or powder which melts to a clear pale yellow liquid when heated. M.p. 57° to 70°. Practically insoluble in water; very slightly soluble in alcohol; freely soluble in dichloromethane and in toluene. Protect from light.

USNF 26 (Cottonseed Oil). The refined fixed oil obtained from the seed of plants of various varieties of *Gossypium hirsutum* or of other species of *Gossypium* (Malvaceae). It is a pale yellow, oily liquid, odourless or nearly so. Slightly soluble in alcohol; miscible with carbon disulfide, with chloroform, with ether, and with petroleum spirit. Store in airtight containers at a temperature not exceeding 40°. Protect from light. At temperatures below 10° particles of solid fat may separate from the oil and at about 0° to −5° the oil becomes a solid or nearly so.

USNF 26 (Hydrogenated Cottonseed Oil). It is obtained by hydrogenating Cottonseed Oil and consists mainly of triglycerides of palmitic and stearic acids. A white mass or powder that melts to a clear, pale yellow liquid when heated. M.p. 57° to 70°. Practically insoluble in water; very slightly soluble in alcohol; freely soluble in dichloromethane and in toluene. Store in airtight containers. Protect from light.

Profile

Cottonseed oil is used as an oily vehicle.

An extract of cottonseed oil, gossypol (p.2316), has been tried as a contraceptive in males.

Couch-grass

Agropyron; Chiendent; Chiendent, rhizome de; Dogs Grass; Grama; Graminis rhizoma; Juolavehnänjuurakko; Kłącze perzu; Kvickrot; Pýrový oddenek; Quackgrass; Tarackbúza-gyökértörzs; Triticum; Twitch; Varpučių šakniastiebiai.

Пырей Ползучий

NOTE. Distinguish from Wheat, *Triticum aestivum* (see p.2415).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Couch Grass Rhizome). The whole or cut, washed and dried rhizome of *Agropyron repens* (*Elymus repens*); the adventitious roots are removed. Protect from light.

Profile

Couch-grass is a mild diuretic that has been used in herbal medicine in the treatment of urinary-tract disorders. It contains glucose, mannitol, inositol, and triticin (a carbohydrate resembling inulin). The Latin binomials *Elytrigia repens* and *Triticum repens* have also been applied to couch-grass.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Acorus.

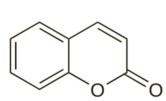
Multi-ingredient: ***Austria:*** Abfuhrtee†; ***Fr.:*** Drainuryl; Herbesan; Mediflor Tisane Antirhumatismale No 2; Mediflor Tisane No 4 Diuretique; Obeflorine; Tisane Hepatique de Hoerdt; ***Ger.:*** Hevert-Blasen-Nieren-Tee N; Presselin Stoffwechsel-Tee Hapeka 225 N†; Renob Blasen- und Nierentee; ***Ital.:*** Betulla (Specie Composta)†; Emmenoiasi; Gramigna (Specie Composta)†; Tisana Kelemata; ***Pol.:*** Dentosept; Diabetofort; Diabetosol; Laxantol; NeoFitolizyna; ***Spain:*** Diurinat; Renusor†; ***UK:*** Antitis; Kas-Bah.

Coumarin

1,2-Benzopyrone; 5,6-Benzo-α-pyrone; Cumarin; Cumarina; Kumaryna; Tonka Bean Camphor. 2*H*-1-Benzopyran-2-one.

$C_9H_6O_2$ = 146.1.

CAS — 91-64-5.



Pharmacopoeias. In *Ger.*

Profile

Coumarin is the odorous principle of Tonka seed (Tonka or Tonquin bean); it may be prepared synthetically. Coumarin has been given to reduce excess tissue protein and associated fluid in the treatment of lymphoedema (see below). It has also been used as a fixative in perfumery and as a flavour. It is reported to be an immunostimulant and has been tried in the treatment of malignant neoplasms.

Coumarin derivatives are used as anticoagulants; coumarin itself is not an active anticoagulant.

Effects on the liver. Coumarin has been classified as hepatotoxic based on studies in *animals* and effects ranging from elevated liver enzymes to serious organ damage has been reported in humans. Seventeen of 2173 patients enrolled in a study of coumarin developed elevated liver enzyme values;[1] the majority of patients were given 100 mg coumarin daily for 1 month followed by 50 mg daily for 2 years. However, none of the patients developed permanent liver damage and liver enzyme values returned to normal in 5 patients who continued taking coumarin. Results from 5 studies supported by the Lymphoedema Association of Australia, in which patients received 400 mg daily for a mean duration of 14.6 months, showed 2 cases of hepatotoxicity among 1106 patients.[2] In the period of 14 months up to May 1995, the Australian Drug Evaluation Committee received 10 reports of suspected adverse reactions to coumarin,[3] including 6 cases of jaundice in women who had taken 400 mg daily for 1 to 4 months. Periportal and lobular necrosis were found on biopsy in 1 case and another had a fatal outcome due to massive hepatic necrosis.

Reports of hepatotoxicity have led to the withdrawal of coumarin in a number of countries.

1. Cox D, *et al.* The rarity of liver toxicity in patients treated with coumarin (1,2-benzopyrone). *Hum Toxicol* 1989; **8:** 501–6.
2. Casley-Smith JR, Casley-Smith JR. Frequency of coumarin hepatotoxicity. *Med J Aust* 1995; **162:** 391.
3. Anonymous. Lodema and the liver. *Aust Adverse Drug React Bull* 1995; **14:** 11. Also available at: http://www.tga.gov.au/adr/aadrb/aadr9508.htm (accessed 30/07/08)

Lymphoedema. Benzopyrones such as coumarin are reported to reduce excess protein in tissues with high-protein oedema, hence the use of coumarin in lymphoedema of various causes, including postmastectomy, and filarial lymphoedema and elephantiasis.[1-5] Evidence for its efficacy is, however, conflicting;[4-6] at best the action is slow and treatment may need to be given for 6 months to 2 years before any benefit is seen.

Coutarea Latiflora

Copalchi.

NOTE. The name copalchi has also been applied to *Croton niveus* (Euphorbiaceae).

Profile

Coutarea latiflora is an ingredient of herbal remedies used in the management of diabetes mellitus. For a report of hepatotoxicity associated with a preparation containing *Coutarea latiflora* see Centaury, p.2279.

Adverse effects. Rhabdomyolysis and haemolysis occurred in a 58-year-old man 2 days after starting treatment with *Coutarea latiflora*.[1] The patient had a similar reaction 4 years earlier after taking the same product.

1. Roca B. Rhabdomyolysis and hemolysis after use of Coutarea latiflora. *Am J Med* 2003; **115:** 677.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Sucontral.

Cowberry

Alpine Cranberry; Arándano rojo; Liść brusznicy (leaf); Red Whortleberry; Vitis Idaeae Folium (leaf).

Pharmacopoeias. In *Pol.*

Profile

The leaves of the cowberry, *Vaccinium vitis-idaea* (Ericaceae), have astringent properties and have been used as a domestic remedy for diarrhoea.

Preparations

Proprietary Preparations (details are given in Part 3)

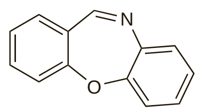
Multi-ingredient: ***Pol.:*** Diuronis.

CR Gas

EA-3547; Gas CR. Dibenz[*b*,*f*][1,4]oxazepine.

$C_{13}H_9NO = 195.2$.

CAS — 257-07-8.



Profile

A riot-control gas with irritant and lachrymatory properties similar to those of CS gas (p.2290); it is described as a tear gas. CR gas is reported not to be hydrolysed by water and therefore to be suitable for use in water cannons.

◊ References.

1. Blain PG. Tear gases and irritant incapacitants. 1-chloroacetophenone, 2-chlorobenzylidene malononitrile and dibenz[b,f]-1,4-oxazepine. *Toxicol Rev* 2003; **22:** 103–10.

Cranberry

Arándano.

Pharmacopoeias. *US* includes a liquid preparation.

USP 31 (Cranberry Liquid Preparation). The bright red juice derived from the fruits of *Vaccinium macrocarpon* or *V. oxycoccus* (Ericaceae). It contains no added substances and is for manufacturing purposes only. pH between 2.4 and 2.6. Store at 2° to 8°.

Profile

Cranberry consists of the fruit of *Vaccinium macrocarpon*, the American cranberry or *V. oxycoccus*, the European cranberry. Cranberry juice has been reported to reduce the incidence of urinary-tract infections.

Interactions. For a report of interactions between cranberry juice and *warfarin*, see p.1430.

Urinary-tract infections. Cranberries and cranberry juice have been used widely for many years for both the prevention and treatment of urinary-tract infections. A systematic review[1] of available data concluded that there was some evidence that cranberry juice for prevention may decrease the number of symptomatic urinary-tract infections in women over a 12 month period, particularly those with recurrent infections. However, evidence for efficacy in the elderly is inconclusive, and currently lacking in patients with neurogenic bladder. The authors recommended further controlled studies in all susceptible patient groups, and also into more acceptable dosage formulations. However, another such review[2] assessing the effectiveness of cranberry for treatment concluded that there was no good quality evidence to suggest that it is effective.

Crataegus

Aubépine; Aubépine, baie d' (hawthorn berries); Aubépine, feuille et fleur d' (hawthorn leaf and flowers); Biancospino; Crataegi folium cum flore (hawthorn leaf and flowers); Crataegi fructus (hawthorn berries); Crataegi Inflorescentia (hawthorn leaf and flowers); English Hawthorn; Galagonyatermés (hawthorn berries); Gudobelių vaisiai (hawthorn berries); Hagtornsbär (hawthorn berries); Haw; Hlohový plod (hawthorn berries); Kwiatostan głogu (hawthorn leaf and flowers); Orapihlajanmarja (hawthorn berries); Owoc głogu (hawthorn berries); Pilriteiro; Weissdorn; Whitethorn.

ATC — C01EB04.

ATC Vet — QC01EB04.

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), and *US.*

Ph. Eur. 6.2 (Hawthorn Berries; Crataegi Fructus). The dried false fruits of *Crataegus oxyacantha* (*C. laevigata*), or *C. monogyna*, or their hybrids or a mixture of these false fruits. They contain not less than 1% of procyanidins, calculated as cyanidin chloride ($C_{15}H_{11}ClO_6$ = 322.7) with reference to the dried drug. Protect from light.

Ph. Eur. 6.2 (Hawthorn Leaf and Flower; Crataegi Folium cum Flore). The whole or cut, dried flower bearing branches of *Crataegus oxyacantha* (*C. laevigata*), or *C. monogyna*, or their hybrids or, more rarely, other European *Crataegus* species including *C. pentagyna*, *C. nigra*, and *C. azarolus*. It contains not less than 1.5% of flavonoids, calculated as hyperoside ($C_{21}H_{20}O_{12}$ = 464.4) calculated with reference to the dried drug. Protect from light.

USP 31 (Hawthorn Leaf with Flower). The dried tips of the flower-bearing branches up to 7 cm in length of *Crataegus monogyna* or *C. laevigata*, also known as *C. oxyacantha* (Rosaceae). It contains not less than 0.6% of *C*-glycosylated flavones, expressed as vitexin ($C_{21}H_{20}O_{10}$ = 432.4), and not less than 0.45% of *C*-glycosylated flavones, expressed as hyperoside, calculated with reference to the dried drug. Protect from light.

Profile

Crataegus contains flavonoid glycosides with cardiotonic properties similar to those of digoxin (p.1259). Crataegus is used in herbal medicine.

Homoeopathy. Crataegus has been used in homoeopathic medicines under the following names: Crataegus oxyacantha; Crat. oxy.

◊ Crataegus is used in herbal medicine for cardiovascular disorders.[1-4] A systematic review[4] of controlled studies concluded that it shows significant benefit compared with placebo as an adjunctive treatment for chronic heart failure. A review[3] of data currently available indicates that it is rarely associated with serious adverse affects, although the authors noted that problems may occur with its unsupervised use, especially if given with other drugs.

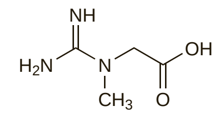
Creatine

N-(Aminoiminomethyl)-*N*-methylglycine.

$C_4H_9N_3O_2 = 131.1$.

CAS — 57-00-1 (creatine); 6020-87-7 (creatine monohydrate).



Creatine Phosphate

Creatina, fosfato de; Creatine Phosphoric Acid; Fosfocreatine; Phosphocreatine. *N*-[Imino(phosphonoamino)-methyl]-*N*-methylglycine.

$C_4H_{10}N_3O_5P = 211.1$.

CAS — 67-07-2 (creatine phosphate); 922-32-7 (creatine phosphate disodium).

ATC — C01EB06.

ATC Vet — QC01EB06.

Profile

Creatine is an endogenous substance found mainly in skeletal muscle of vertebrates. Creatine phosphate and its disodium salt have been tried in the treatment of cardiac disorders. Creatine phosphate has also been added to cardioplegic solutions. Creatine monohydrate has been tried in metabolic disorders and used as a dietary supplement. It is also under investigation for the treatment of Parkinson's disease, motor neurone disease (p.2380), Duchenne muscular dystrophy, and Huntington disease.

Multi-ingredient: ***Ital.:*** Fortium.

Creatinine

Creatinina. 2-Amino-1-methyl-4-imidazolidinone.

$C_4H_7N_3O = 113.1$.

CAS — 60-27-5.

Pharmacopoeias. In *Ger.* Also in *USNF.*

USNF 26 (Creatinine). White, odourless, crystals or crystalline powder. Soluble in water; slightly soluble in alcohol; practically insoluble in acetone, in chloroform, and in ether.

Profile

Creatinine is used as a bulking agent for freeze-drying.

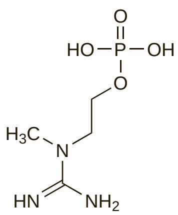
Plasma concentrations or clearance of endogenous creatinine are used as an index of renal function.

Creatinolfosfate Sodium *(rINNM)*

Créatinolfosfate de Sodium; Creatinolfosfato sódico; Natrii Creatinolfosfatum. The sodium salt of 1-(2-hydroxyethyl)-1-methylguanidine *O*-phosphate .

Натрий Креатинолфосфат

$C_4H_{11}N_3NaO_4P$ = 219.1.
CAS — 6903-79-3 (creatinolfosfate).
ATC — C01EB05.
ATC Vet — QC01EB05.



(creatinolfosfate)

Profile

Creatinolfosfate has been used as an adjuvant in the treatment of cardiac disorders.

Crotalaria

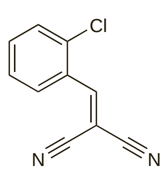
Profile

Crotalaria spp. have been used in herbal teas but liver damage has been reported after their ingestion, possibly due to their content of pyrrolizidine alkaloids.

CS Gas

CS Gazi; CS Spray; Gas CS.

$C_{10}H_5ClN_2$ = 188.6.
CAS — 2698-41-1.



Profile

CS gas (more properly CS spray) is the name commonly given to a particulate dispersion of α-(*o*-chlorobenzylidene) malonitrile, used as a riot-control agent or 'tear gas'. Its toxic effects include irritation of the eyes and nose, with copious lachrymation and rhinorrhoea; blepharospasm; a burning sensation of the mouth and throat; tightness in the chest, with difficulty in breathing; coughing; an increase in salivation; and retching and vomiting. These effects usually disappear within 15 minutes after exposure ends. The effects of pre-existing disease of the respiratory tract may be exacerbated. Erythema and blistering of the skin may occur.

If symptoms persist, the patient should be removed to a well ventilated area. Treatment is symptomatic. Contaminated skin may be washed with soap and water, but only if symptoms persist since exposure to water may initially exacerbate symptoms. If contamination of the eyes has been severe they should be irrigated with physiological saline or water.

Cusparia

Angostura; Angostura Bark; Carony Bark; Cusparia Bark.

NOTE. 'Angostura Bitters' (*Dr. J.G.B. Siegert & Sons Ltd*) contains gentian and various aromatic ingredients but no cusparia; it is named after the town in which it was first made.

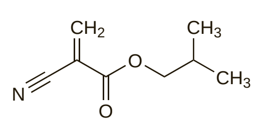
Profile

Cusparia, the bark of *Galipea officinalis* (Rutaceae), has been used as a bitter.

Cyanoacrylate Adhesives

Cianoacrilato, adhesivos de.

CAS — 1069-55-2 (bucrilate); 6606-65-1 (enbucrilate); 137-05-3 (mecrilate); 6701-17-3 (ocrilate);.



(bucrilate)

Profile

A number of cyanoacrylate compounds have been used as surgical tissue adhesives. They include:

- bucrilate (bucrylate; isobutyl 2-cyanoacrylate, $C_8H_{11}NO_2$ = 153.2)
- enbucrilate (butyl 2-cyanoacrylate, $C_8H_{11}NO_2$ = 153.2),
- mecrilate (mecrylate; methyl 2-cyanoacrylate, $C_5H_5NO_2$ = 111.1)
- ocrilate (ocrylate; octil 2-cyanoacrylate, $C_{12}H_{19}NO_2$ = 209.3).

Some cyanoacrylates are used for household purposes and as nail fixatives and others have been investigated as tubal occlusive agents for female sterilisation, for sclerotherapy in bleeding gastric varices (see under Monoethanolamine, p.2346), and for embolisation of intracranial vascular lesions. Cyanoacrylate adhesives have also been used to plug corneal perforations until donor tissue is available.

Adverse effects. Reports of inadvertent application of cyanoacrylate adhesives to the eyes,[1,2] mouth,[3] and ears.[4,5] Pulmonary embolisation of ocrilate has been reported[6] when it was used to obliterate gastric varices in a patient.

3. Cousin GCS. Accidental application of cyanoacrylate to the mouth. *Br Dent J* 1990; **169:** 293–4.
4. O'Donnell JJ, *et al.* Cyanoacrylate adhesive mistaken for ear drops. *J Accid Emerg Med* 1997; **14:** 199.
5. Persaud R. A novel approach to the removal of superglue from the ear. *J Laryngol Otol* 2001; **115:** 901–2.
6. Rickman OB, *et al.* Pulmonary embolization of 2-octyl cyanoacrylate after endoscopic injection therapy for gastric variceal bleeding. *Mayo Clin Proc* 2004; **79:** 1455–8.

Treatment of adverse effects. In the event of accidental adhesion of the skin the bonded surfaces may be separated after application of acetone, prolonged soaking in warm (not hot) soapy water, and/or mixtures of alcohol and water. Application of liquid paraffin may help in removal from the skin. If necessary, the surfaces may be peeled or rolled apart with the aid of a spatula; attempts should not be made to pull the surfaces directly apart. Acetone and alcohol should not be used near or in the eyes. Solvents such as nitromethane, toluene, or xylene may be used to aid skin detachment from solid objects. Solvents should be used with care and should not be introduced into the oropharynx. Eyelids stuck together or bonded to the eyeball should be washed thoroughly with saline or water at room temperature for 15 minutes and a gauze patch applied; the eye will open without further action in 1 to 4 days. Manipulative attempts to open the eyes should not be made. Although cyanoacrylate introduced into the eyes may cause double vision and lachrymation there is usually no residual damage. If lips are accidentally stuck together plenty of warm water should be applied and maximum wetting from saliva inside the mouth encouraged. Lips should be peeled or rolled apart and not pulled. Adhesive introduced into the mouth solidifies and adheres, but saliva will lift the adhesive in ⁄ to 2 days. Care should be taken to avoid choking.

Heat is evolved on solidification of cyanoacrylate and in rare cases may cause burns.

Uses. References to the use of cyanoacrylate adhesives,[1-10] including bucrilate,[1,2] enbucrilate,[3,4] and ocrilate.[5-9]

Preparations

Proprietary Preparations (details are given in Part 3)

Arg.: Dermabond; ***Fr.:*** Dermabond; ***UK:*** Dermabond; Histoacryl; Indermil; LiquiBand; SuperSkin.

Multi-ingredient: ***Ger.:*** Epiglu; ***Irl.:*** Epiglu; ***UK:*** Epiglu.

Cyclobutyrol Sodium *(rINNM)*

Ciclobutirol sódico; Cyclobutyrol Sodique; Natrii Cyclobutyrolum. Sodium 2-(1-hydroxycyclohexyl)butyrate.

Натрий Циклобутирол

$C_{10}H_{17}NaO_3$ = 208.2.
CAS — 512-16-3 (cyclobutyrol); 1130-23-0 (cyclobutyrol sodium).
ATC — A05AX03.
ATC Vet — QA05AX03.

Profile

Cyclobutyrol sodium is a choleretic that has been given by mouth. Cyclobutyrol betaine, cyclobutyrol calcium, and cyclobutyrol nicotinamide have been used similarly.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Trommgallol; ***Spain:*** Menabil Complex†; Salcemetic†; Sugarbil.

Cyclodextrins

Ciclodextrinas.

Alfadex *(BAN, rINN)*

Alfadeksas; Alfadeksi; Alfadexum; Alpha Cyclodextrin; Alphacyclodextrin; α-Cyclodextrin; Cyclohexaamylose; Cyclomaltohexose. Cyclomaltohexaose.

Альфадекс

$C_{36}H_{60}O_{30}$ = 972.8.
CAS — 10016-20-3.

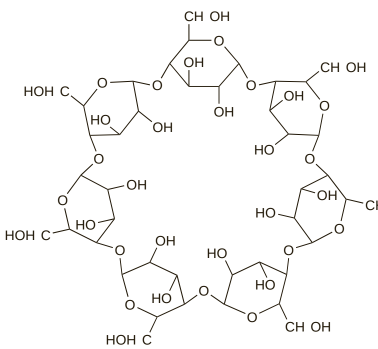
Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*
Ph. Eur. 6.2 (Alfadex). A white or almost white, amorphous or crystalline powder. Freely soluble in water and in propylene glycol; practically insoluble in dehydrated alcohol and in dichloromethane. Store in airtight containers.
USNF 26 (Alfadex). A white or almost white, amorphous or crystalline, powder. Freely soluble in water and in propylene glycol; practically insoluble in dehydrated alcohol and in dichloromethane. Store in airtight containers.

Betadex *(BAN, USAN, rINN)*

Beetadeksi; Betadeksas; Bétadex; Betadexum; β-Cyclodextrin; E459. Cyclo-α-(1→4)-D-heptaglucopyranoside.

Бетадекс

$C_{42}H_{70}O_{35}$ = 1135.
CAS — 7585-39-9.



Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii). Also in *USNF.*
Ph. Eur. 6.2 (Betadex). A white or almost white, amorphous or crystalline powder. Sparingly soluble in water; practically insoluble in alcohol and in dichloromethane; freely soluble in propylene glycol. Store in airtight containers.
USNF 26 (Betadex). A nonreducing cyclic compound composed of seven alpha-(1-4) linked D-glucopyranosyl units. It is a white, practically odourless, fine crystalline powder. Soluble 1 in 54 of water. Store in airtight containers.

Hydroxypropylbetadex

Hidroksipropilbetadeksas; Hydoxipropylbetadex; Hydroksipropyylibetadeksi; Hydroxypropylbétadex; Hydroxypropylbetadexum; 2-Hydroxypropyl-β-cyclodextrin.

Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*
Ph. Eur. 6.2 (Hydroxypropylbetadex). A white or almost white, amorphous or crystalline powder. Freely soluble in water and in propylene glycol.
USNF 26 (Hydroxypropyl Betadex). A white or almost white, amorphous or crystalline powder. Freely soluble in water and in propylene glycol.

Profile

Cyclodextrins, such as alfadex and betadex, are produced by the enzymatic degradation of starch and are used as carrier molecules for drug delivery systems. Hydroxypropylbetadex, a derivative of betadex, is also used.

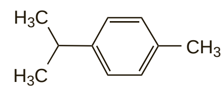
Cymene

Cimeno; *p*-Cymene; *p*-Cymol; p-Cymen. 4-Isopropyl-1-methylbenzene; 4-Isopropyltoluene.

$C_{10}H_{14}$ = 134.2.
CAS — 25155-15-1; 99-87-6 (p-cymene).



(p-cymene)

Profile

Cymene is used in perfumery. It has also been used as a topical local analgesic for the relief of pain in rheumatic conditions.

Cynara

Alcachofa; Alcachôfra; Artichaut; Artichaut, feuille d'; Artichoke Leaf; Artičokový list; Cynarae folium; Liść karczocha.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Artichoke Leaf). The whole or cut, dried leaf of *Cynara scolymus*. It contains a minimum 0.8% of chlorogenic acid ($C_{16}H_{18}O_9$ = 354.3), calculated with reference to the dried drug. Protect from light.

Profile

Cynara, the leaf of the globe artichoke, *Cynara scolymus* (Compositae), is reputed to have diuretic and choleretic properties. It may also have some hypolipidaemic activity.

◊ References.

Cynarine *(rINN)*

Cinarina; Cynarin; Cynarinum; Cynaryna; 1,5-Dicaffeoylquinic Acid. 1-Carboxy-4,5-dihydroxy-1,3-cyclohexylene bis(3,4-dihydroxycinnamate).

Цинарин

$C_{25}H_{24}O_{12}$ = 516.5.
CAS — 1182-34-9; 1884-24-8.

Profile

Cynarine is an active ingredient of cynara (above). It has been used as a choleretic.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** HDG; ***Austria:*** Trommgallol.

Cypress

Italian Cypress; Mediterranean Cypress.

Profile

Italian or Mediterranean cypress (*Cupressus sempervirens*, Cupressaceae) is included in preparations for peripheral vascular disorders.

It is the source of cypress oil. Cypress oil is used in preparations for the relief of cough and cold symptoms and in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

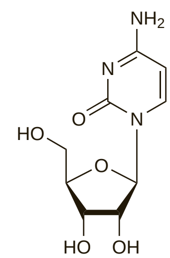
Multi-ingredient: ***Fr.:*** Arterase; Circulatonic; Mediflor Tisane Circulation du Sang No 12; Veinostase; ***Ital.:*** Colostrum; Venalta; ***Port.:*** Solubeol†; ***Spain:*** Natusor Circusil†; Proctosor†; Ruscimel†; Trophires†; Vapores Pyt; ***Switz.:*** Eucapinol; Makaphyt Baume†; Novital.

Cytidine

Cytosine Riboside. 4-Amino-1-β-D-ribofuranosyl-2-(1*H*)-pyrimidinone.

Цитидин

$C_9H_{13}N_3O_5$ = 243.2.
CAS — 65-46-3.



Profile

Cytidine is an endogenous cytosine nucleoside involved in many biological processes; it is one of the components of nucleic acids (p.2355). Cytidine is used in preparations containing other nucleosides in the treatment of corneal damage. It has also been used in preparations for liver disorders, anaemias, and as a tonic. Disodium cytidine phosphate is included in preparations for neuralgia, neuritis, and myopathies and has also been used for peripheral and cerebral vascular disorders; the triphosphate has also been used.

Preparations

Proprietary Preparations (details are given in Part 3)

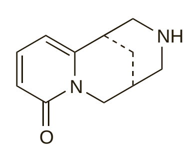
Multi-ingredient: ***Arg.:*** Nucleo CMP†; ***Belg.:*** Vitacic; ***Braz.:*** Nucleo CMP; ***Chile:*** Citoneuron; ***Cz.:*** Laevadosin†; ***Ger.:*** Keltican N; ***Hung.:*** Vitacic†; ***Ital.:*** Centrum; ***Mex.:*** Nucleo CMP; ***Mon.:*** Vitacic; ***Rus.:*** Vitacic (Витасик)†; ***Spain:*** Cefabol; Nucleo CMP.

Cytisine

Baptitoxine; Laburnine; Sophorine; Ulexine. 1,2,3,4,5,6-Hexahydro-1,5-methano-8*H*-pyrido[1,2-*a*][1,5]diazocin-8-one.

Цитизин

$C_{11}H_{14}N_2O$ = 190.2.
CAS — 485-35-8.



Profile

Cytisine is a highly toxic alkaloid found in laburnum (p.2329) and some other leguminous plants. It resembles nicotine (p.2352) in its actions and has been given orally as an aid to smoking cessation (p.2354). The dose is 1.5 mg 6 times daily for 3 days which is then gradually reduced over the next 3 weeks to 1.5 to 3 mg daily for the final 5 days of treatment. Treatment of adverse effects of cytisine is as described for Nicotine, p.2352.

A 0.15% solution of cytisine known as Cytitone has been used intravenously or intramuscularly in some countries as a respiratory stimulant.

Preparations

Proprietary Preparations (details are given in Part 3)
Bulg.: Tabex (Табекс); ***Hung.:*** Tabex†; ***Pol.:*** Tabex; ***Rus.:*** Tabex (Табекс).

Cytochrome C

Citocromo C.

Pharmacopoeias. *Chin.* includes Cytochrome C Solution and preparations for injection.

Profile

Cytochrome C is a haemoprotein occurring in the body and involved in electron and hydrogen transport in biological oxidation processes. It has been given intravenously in various hypoxic conditions.

Cytochrome C is an ingredient of some eye drops used for the treatment of cataract but its actions, if any, are unclear.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Citophase; ***Jpn:*** Cytorest.

Multi-ingredient: ***Rus.:*** Oftan Catachrom (Офтан Катахром); ***Spain:*** Vitaphakol.

Cytokines

Citocinas; Citokinas; Citoquinas.

Цитокины

Profile

Cytokines are a group of endogenous soluble peptides produced by many different cell types in response to noxious stimuli. In contrast to peptide hormones, they tend to act locally. Cytokines affect expression of genes influencing changes at the cellular level and have a regulatory function, acting as growth factors in cellular differentiation and/or proliferation. Cytokines are also involved in host responses to disease such as infection or inflammation. Some cytokines induce inflammation whereas others have an anti-inflammatory action through inhibition of proinflammatory cytokines. Cytokines are classified by their biological activity rather than structure and most are pleiotropic (i.e. they are multifunctional). A large number of cytokines alter endothelial function affecting permeability and may also cause cellular damage or death. Some cytokines are involved in the pathophysiology of diseases, particularly immune, inflammatory, and infectious diseases; they may also be involved in the development of cardiovascular disease.

Cytokines that are used clinically include:

- granulocyte colony-stimulating factors such as filgrastim (p.1070)
- granulocyte-macrophage colony-stimulating factors such as molgramostim (p.1073)
- interferons (p.885)
- some interleukins (p.2325)
- oprelvekin (p.1074), a platelet growth factor
- palifermin (p.2359), a keratinocyte growth factor
- somatomedins (p.1807)
- thrombopoietin (p.1080)
- trafermin (p.1618), a fibroblast growth factor
- tumour necrosis factor (p.783)
- urogastrone (p.1778), an epidermal growth factor

Anticytokine-based therapy may involve suppressing the action of single or related cytokines by specific soluble cytokine receptors, antagonists to the cytokine receptor, or antibodies against the cytokine. Alternatively, the synthesis of several unrelated cytokines may be suppressed by a single therapeutic agent. Fusion toxins in which protein sequences from cytokines or natural growth factors are combined with a bacterial toxin have also been produced to target specific cytokines.

Damiana

Turnera.

Profile

Damiana is the dried leaves and stem of *Turnera diffusa* var. *aphrodisiaca* (Turneraceae) and possibly other species of *Turnera*.

Damiana is drunk as a tea, and is used in herbal medicine for a variety of indications. It has a reputation as an aphrodisiac, but there is no evidence for this.

Homoeopathy. Damiana has been used in homoeopathic medicines under the following names: Turnera diffusa.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Bioglan Mens Super Soy/Clover; Bioglan The Blue One; Medinat Esten†; Nevaton; ***Canad.:*** Damiana-Sarsaparilla Formula†; ***Indon.:*** Instink; Maxirex; Menolia; Neo Hormoviton; Tripote; Tristan; ***Ital.:*** Dam; Four-Ton; ***Malaysia:*** Total Man†; ***Pol.:*** Tripoten; ***Spain:*** Energysor†; ***UK:*** Daily Fatigue Relief; Damiana and Kola Tablets; Elixir Damiana and Saw Palmetto; Regina Royal Concorde; Strength; Zotrim.

Dapiprazole Hydrochloride *(USAN, rINNM)*

AF-2139; Dapiprazole, Chlorhydrate de; Dapiprazoli Hydrochloridum; Hidrocloruro de dapiprazol. 5,6,7,8-Tetrahydro-3-[2-(4-*o*-tolyl-1-piperazinyl)ethyl]-*s*-triazolo[4,3-*a*]pyridine monohydrochloride.

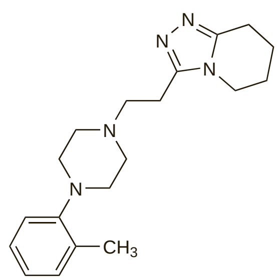
Дапипразола Гидрохлорид

$C_{19}H_{27}N_5,HCl = 361.9.$

CAS — 72822-12-9 (dapiprazole); 72822-13-0 (dapiprazole hydrochloride).

ATC — S01EX02.

ATC Vet — QS01EX02.



(dapiprazole)

Profile

Dapiprazole hydrochloride is an alpha blocker given as eye drops to reverse mydriasis; it is also used in some countries in the management of glaucoma.

Preparations

Proprietary Preparations (details are given in Part 3)
Austria: Benglau; ***Gr.:*** Glamidolo; ***Israel:*** Glamidolo†; ***Ital.:*** Glamidolo; ***USA:*** Rev-Eyes.

Dehydrocholic Acid *(BAN, rINN)*

Acide Déhydrocholique; Ácido dehidrocólico; Acidum Dehydrocholicum; Chologon; Dehydrocholsyra; Dehydrokoolihappo; Triketocholanic Acid. 3,7,12-Trioxo-5β-cholan-24-oic acid.

Дегидрохолевая Кислота

$C_{24}H_{34}O_5 = 402.5.$

CAS — 81-23-2 (dehydrocholic acid); 145-41-5 (sodium dehydrocholate).

Pharmacopoeias. In *Chin., It., Jpn,* and *US.*

USP 31 (Dehydrocholic Acid). A white, fluffy, odourless powder. Practically insoluble in water; soluble 1 in 100 of alcohol, 1 in 135 of acetic acid at 15°, 1 in 130 of acetone at 15°, 1 in 35 of chloroform, 1 in 2200 of ether at 15°, 1 in 135 of ethyl acetate at 15°, and 1 in 960 of benzene at 15°; solutions in alcohol and in chloroform are usually slightly turbid; soluble in glacial acetic acid and in solutions of alkali hydroxides and carbonates.

Profile

Dehydrocholic acid is a semisynthetic bile acid (p.2266) that is given for its hydrocholeretic properties, increasing the volume and water content of the bile without appreciably altering the content of bile acids. It has been used to improve biliary drainage and has also been given for the temporary relief of constipation. The usual oral dose is 250 to 500 mg three times daily after meals.

Dehydrocholic acid is contra-indicated in significant cholelithiasis, complete mechanical biliary obstruction, and in severe hepatic impairment.

Preparations

USP 31: Dehydrocholic Acid Tablets.

Proprietary Preparations (details are given in Part 3)
USA: Cholan-HMB; Decholin.

Multi-ingredient: ***Arg.:*** Arnol; Bagohepat; Bibol Leloup; Bil 13; Bil 13 Enzimatico; Bilagol; Carbogasol Digestivo; Digenorflat; Hepadigenor†; Hepatalgina; Lorbihepatic; Novodig†; Pakinase; Palatrobil; Pankreon Compuesto†; Pankreon Total; Zimerol; ***Braz.:*** B-Vesil; Digeplus; Digestron†; Essen; Filogaster†; Plasil Enzimatico; Sintozima; ***Hong Kong:*** Bilsan; ***Hung.:*** Neo-Bilagit; ***Mex.:*** Bagohepat; Plasil Enzimatico; ***Philipp.:*** Spasmo-Canulase; ***Pol.:*** Rapacholin C; Rapacholin Forte; ***Port.:*** Espasmo Canulase; ***S.Afr.:*** Spasmo-Canulase; ***Spain:*** Nulacin Fermentos; ***Switz.:*** Spasmo-Canulase.

Delmopinol Hydrochloride *(rINNM)*

Delmopinol, Chlorhydrate de; Delmopinoli Hydrochloridum; Hidrocloruro de delmopinol; M-1650. ±-3-(4-Propylheptyl)-4-morpholineethanol hydrochloride.

Дельмопинола Гидрохлорид

$C_{16}H_{33}NO_2,HCl = 307.9.$

CAS — 79874-76-3 (delmopinol); 98092-92-3 (delmopinol hydrochloride).

Profile

Delmopinol prevents the formation of dental plaque by coating the teeth and preventing adhesion of bacteria. It is used as the hydrochloride, as a mouth rinse in the treatment and prevention of gingivitis.

Preparations

Proprietary Preparations (details are given in Part 3)
UK: Decapinol.

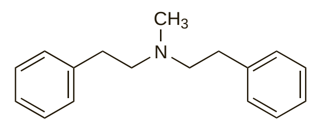
Demelverine Hydrochloride *(rINNM)*

Démelvérine, Chlorhydrate de; Demelverini Hydrochloridum; Hidrocloruro de demelverina; Methphenaethamine Hydrochloride; *N*-Methyldiphenethylamine Hydrochloride. *N*-Methyl-*N*-(2-phenylethyl)-benzeneethanamine hydrochloride.

Демельверина Гидрохлорид

$C_{17}H_{21}N,HCl = 275.8.$

CAS — 13977-33-8 (demelverine); 18719-09-0 (demelverine hydrochloride).



(demelverine)

Profile

Demelverine hydrochloride is an antispasmodic that has been used in the treatment of smooth muscle spasm.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ger.:*** Spasman†.

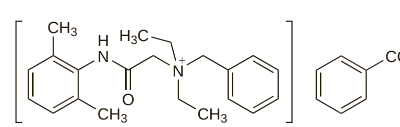
Denatonium Benzoate *(BAN, USAN, rINN)*

Benzoato de denatonio; Denatonii Benzoas; Dénatonium, Benzoate de; NSC-157658. Benzyldiethyl(2,6-xylylcarbamoylmethyl)ammonium benzoate monohydrate.

Денатония Бензоат

$C_{28}H_{34}N_2O_3,H_2O = 464.6.$

CAS — 3734-33-6 (anhydrous denatonium benzoate); 86398-53-0 (denatonium benzoate monohydrate).



Pharmacopoeias. In *USNF.*

USNF 26 (Denatonium Benzoate). When dried at 105° for 2 hours, it contains one molecule of water of hydration or is anhydrous. Soluble 1 in 20 of water, 1 in 2.4 of alcohol, 1 in 2.9 of chloroform, and 1 in 5000 of ether; very soluble in methyl alcohol. pH of a 3% solution in water is between 6.5 and 7.5. Store in airtight containers.

Profile

Denatonium benzoate is used where an intensely bitter taste is required for medicinal or industrial purposes and as a partial denaturant for alcohol in toiletries. It is known commercially as Bitrex.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Fr.:*** Skin Nail.

Deoxyribonucleic Acid

ADN; Animal Nucleic Acid; Desoxirribonucleico, ácido; Desoxypentose Nucleic Acid; Desoxyribonucleic Acid; Desoxyribose Nucleic Acid; DNA; Thymus Nucleic Acid.

ДНК; Дезоксирибонуклеиновая Кислота

Profile

Deoxyribonucleic acid (DNA) is a nucleic acid (p.2355) in which the pentose sugar moiety of the nucleotides is deoxyribose, the purine bases are adenine (p.2247) and guanine, and the pyrimidine bases are cytosine and thymine. Hydrogen bonds between complementary pairs of purine and pyrimidine bases link 2 polynucleotide strands, which are twisted to form a double helix with the bases on the inside of the structure and the sugar-phosphate backbone on the outside. Pairing of bases between complementary strands of DNA is always the same: adenine with thymine and cytosine with guanine. DNA is present in cell nuclei and its function is to carry the genetic material of cellular organisms and DNA viruses. It also provides the template for the production of ribonucleic acid (p.2379). For the role of DNA in gene therapy, see p.2310.

Proprietary preparations of DNA are marketed in some countries for a variety of debilitating and convalescent conditions; the sodium and magnesium salts of DNA have also been used.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: ADN; ***Ital.:*** Placentex; ***Rus.:*** Derinat (Деринат).

Multi-ingredient: ***Fr.:*** Adena C†; ***India:*** Placentrex.

Dextran Sulfate *(BANM, rINNM)*

Dextran, Sulfate de; Dextran Sulfate Sodium; Dextran Sulphate; Dextran Sulphate Sodium; Dextrani Sulfas; Sulfato de dextran.

Декстрана Сульфат

CAS — 9011-18-1.
ATC — B05AA05.
ATC Vet — QB05AA05.

Pharmacopoeias. In *Jpn.*

Profile

Dextran sulfate is the sodium salt of sulfuric acid esters of dextran. It has been used as an anticoagulant and as a lipid regulating drug, and has been investigated for its antiviral activity. Dextran sulfate potassium has also been used.

Interactions. As mentioned on p.1195 (under Hypersensitivity), anaphylactoid reactions have occurred in patients receiving ACE inhibitors during low-density lipoprotein apheresis using a dextran sulfate-cellulose column.[1,2] Withdrawal of the ACE inhibitor for 1 to 3 days before apheresis may prevent the reaction.[2]

1. Olbricht CJ, *et al.* Anaphylactoid reactions, LDL apheresis with dextran sulphate, and ACE inhibitors. *Lancet* 1992; **340:** 908–9.
2. Agishi T. Anion-blood contact reaction (ABC reaction) in patients treated by LDL apheresis with dextran sulfate-cellulose column while receiving ACE inhibitors. *JAMA* 1994; **271:** 195–6.

Preparations

Proprietary Preparations (details are given in Part 3)

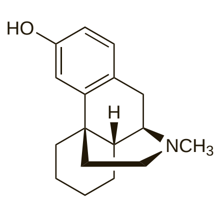
Multi-ingredient: ***Arg.:*** Diroseal; ***Austral.:*** VR†; ***Chile:*** Cicapost; Diroseal; Ureadin Rx DB; ***Cz.:*** Doxivenil†; ***Fr.:*** Avene Antirougeurs; Creme au Melilot Composee; Dextrarine Phenylbutazone; Diroseal; Prebutix; ***Ger.:*** Phlebodril N; ***Hung.:*** Doxivenil; ***Ital.:*** Stranoval; ***Port.:*** Cicapost; Doxivenil; ***Switz.:*** Doxivenil; ***Venez.:*** Doxivenil.

Dextrorphan *(BAN, pINN)*

Dextrorfano; Dextrorphane; Dextrorphanum. 17-Methyl-9α,-13α,14α-morphinan-3-ol.

Декстрорфан

$C_{17}H_{23}NO$ = 257.4.
CAS — 125-73-5.



Dextrorphan Hydrochloride *(BANM, USAN, pINNM)*

Dextrorphane, Chlorhydrate de; Dextrorphani Hydrochloridum; Hidrocloruro de dextrorfano; Ro-01-6794/706.

Декстрорфана Гидрохлорид

$C_{17}H_{23}NO,HCl$ = 293.8.
CAS — 69376-27-8.

Profile

Dextrorphan, a metabolite of dextromethorphan (p.1555), is an antagonist of the excitatory neurotransmitter *N*-methyl-D-aspartate (NMDA). It possesses some cough suppressant activity and has been investigated as a neuroprotective agent in the management of stroke.

◊ References.

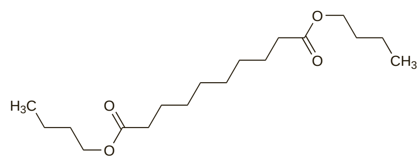
Dibutyl Sebacate

Sebacato de dibutilo.

$C_{18}H_{34}O_4$ = 314.5.
CAS — 109-43-3.



Pharmacopoeias. In *USNF.*

USNF 26 (Dibutyl Sebacate). It consists of esters of *n*-butyl alcohol and saturated dibasic acids, principally sebacic acid. A colourless, oily liquid of very mild odour. Practically insoluble in water and in glycerol; soluble in alcohol, in isopropyl alcohol, and in liquid paraffin; very slightly soluble in propylene glycol. Store in airtight containers.

Profile

Dibutyl sebacate is a plasticiser used in pharmaceutical formulation of tablets (including modified release), beads, and granules, and microcapsule preparations. It is also used as a food flavouring.

Dichlorodiethylsulfide

Dichlorodiethylsulphide; Gas mostaza; Iperita; Mustard Gas; Sulfur Mustard; Sulfuro de dicloroetileno; Yellow Cross Liquid; Yperite. Bis(2-chloroethyl)sulphide.

$C_4H_8Cl_2S$ = 159.1.
CAS — 505-60-2.

Profile

Dichlorodiethylsulfide was developed for use in chemical warfare and has even more severe vesicant and irritant properties than its nitrogen analogue, chlormethine (p.697). It was formerly used topically in the treatment of psoriasis.

◊ Reviews of the toxicology of dichlorodiethylsulfide,[1-4] and debate on the management of casualties injured by dichlorodiethylsulfide and other chemical warfare agents.[5-11] Most patients exposed to dichlorodiethylsulfide recover largely or completely and only a small proportion will have severe long-term eye or lung damage,[12,13] although death from respiratory, renal, and bone-marrow failure may occur.[11] A combination of 1% phenol and 1% menthol applied topically produced significant relief of pruritus compared with placebo in a randomised study of 80 war veterans with chronic skin lesions following exposure to dichlorodiethylsulfide.[14]

Eleven fishermen who accidentally retrieved corroded and leaking gas shells containing dichlorodiethylsulfide from underwater dumps, presented with very inflamed skin, especially in the axillary and genitofemoral regions, yellow blisters on the hands and legs, painful irritation of the eyes, and transient blindness. Two developed pulmonary oedema.[15] There was evidence of a mutagenic effect and in view of the increased risk of lung cancer in soldiers and workers exposed to the gas it is reasonable to assume that fishermen heavily exposed to dichlorodiethylsulfide also have an increased cancer risk.

Digitalin

Amorphous Digitalin; Digitalina; Digitalinum Purum Germanicum.

NOTE. Distinguish from Digitaline Cristallisée (digitoxin, p.1259) which is very much more potent.

Profile

Digitalin is a standardised mixture of glycosides from *Digitalis purpurea*. It has actions similar to those of digoxin (p.1259). Because of its ready solubility in water it was formerly used for the preparation of solutions for injection. It is also present in some ophthalmic preparations.

Preparations

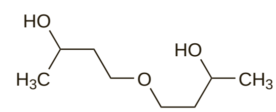
Proprietary Preparations (details are given in Part 3)
Ger.: Augentonikum N.

Multi-ingredient: ***Ital.:*** Digifar†.

Dihydroxydibutylether

Dihidroxidibutiléter; Hydroxybutyloxide. 4,4′-Oxybis(butan-2-ol).

$C_8H_{18}O_3$ = 162.2.
CAS — 821-33-0.



Profile

Dihydroxydibutylether is a choleretic.

Preparations

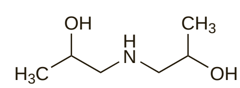
Proprietary Preparations (details are given in Part 3)
Ital.: Diskin†.

Multi-ingredient: ***Arg.:*** Binvex; Cistoquine Plus†; ***Ital.:*** Dis-Cinil Complex.

Diisopropanolamine

Diisopropanolamina. 1,1′-Iminobis(propan-2-ol).

$C_6H_{15}NO_2$ = 133.2.
CAS — 110-97-4.



Pharmacopoeias. In *USNF.*

USNF 26 (Diisopropanolamine). A mixture of isopropanolamines, consisting largely of diisopropanolamine. Store in airtight containers. Protect from light.

Profile

Diisopropanolamine is an organic base that is used as a neutralising agent in cosmetics and toiletries.

Dill

Aneth; Anethum; Eneldo.

NOTE. Indian Dill is the dried ripe fruits of *Anethum sowa*.

Pharmacopoeias. *Fr.* includes dill fruit.

Profile

Dill (*Anethum graveolens*, Apiaceae) is a culinary herb and has also been used in herbal medicine. It is the source of dill oil (see below).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Colax; ***Fr.:*** Calmosine†.

Dill Oil

Eneldo, aceite esencial de; European Dill Seed Oil; Oleum Anethi.

CAS — 8016-06-6.

Pharmacopoeias. In *Br.*

BP 2008 (Dill Oil). A clear colourless or pale yellow liquid, visibly free from water, obtained by distillation from the dried ripe fruits of *Anethum graveolens*. It darkens with age and has a characteristic odour of the crushed fruit. It contains 43 to 63% of carvone. At 20°, soluble 1 in 1 or more of alcohol (90%) and 1 in 10 or more of alcohol (80%). Store at a temperature not exceeding 25° in well-filled containers. Protect from light.

Profile

Dill oil, usually in the form of dill water, is used as an aromatic carminative, although the efficacy of such traditional remedies in infant colic is considered dubious (see Gastrointestinal Spasm, p.1696).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Canad.:*** Chase Kolik Gripe Water; Woodwards Gripe Water; ***Fr.:*** Calmosine†; ***India:*** Bestozyme; Neopeptine; ***Israel:*** Dentinox; Nurse Harvey's Gripe Mixture; Woodwards Gripe Water; ***Rus.:*** Solutan (Солутан); ***Singapore:*** Dentinox; ***Thai.:*** Baby Gripe; Bebidol†; Gripe Mixture; Woodwards Gripe Water; ***UK:*** Atkinson & Barker's Gripe Mixture; Neo Baby Gripe Mixture; Neo Gripe Mixture; Nurse Harvey's Gripe Mixture; Woodwards Gripe Water.

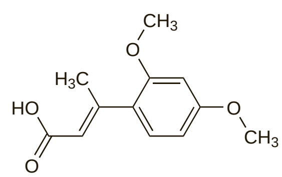
Dimecrotic Acid *(rINN)*

Acide Dimécrotique; Ácido dimecrótico; Acidum Dimecroticum. 2,4-Dimethoxy-β-methylcinnamic acid.

Димекротовая Кислота

$C_{12}H_{14}O_4$ = 222.2.

CAS — 7706-67-4.



Profile

Dimecrotic acid has been used as the magnesium salt as a choleretic.

Preparations

Proprietary Preparations (details are given in Part 3)

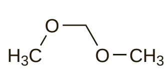
Fr.: Hepadial; ***Port.:*** Hepadoddi; Hepaquifa; ***Spain:*** Fisiobil.

Dimethoxymethane

Dimetoximetano; Formal; Formaldehyde Dimethyl Acetal; Methylal.

$CH_2(OCH_3)_2$ = 76.09.

CAS — 109-87-5.



Profile

Dimethoxymethane has been used in perfumery. It has been included in preparations for topical analgesia.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** PR Freeze Spray.

Dimethyl Sulfone

Dimethyl Sulphone; Dimetylosulfon; $DMSO_2$; Methyl Sulphone; Methylsulfonylmethane; Methylsulphonylmethane; MSM; Sulfonylbismethane.

$C_2H_6O_2S$ = 94.13.

CAS — 67-71-0.

Pharmacopoeias. In *US.*

USP 31 (Methylsulfonylmethane). A white powder or flake crystal. Freely soluble in water, in alcohol, in acetone, and in methyl alcohol; sparingly soluble in ether.

Profile

Dimethyl sulfone is an oxidation product of dimethyl sulfoxide (p.2022) and has been used similarly as an organic solvent. It may be responsible for some of the pharmacological actions of dimethyl sulfoxide and has been tried in disorders including osteoarthritis, allergic rhinitis, and interstitial cystitis. It has also been used as a nutritional supplement.

◊ References.

Preparations

USP 31: Glucosamine and Methylsulfonylmethane Tablets; Glucosamine, Chondroitin Sulfate Sodium, and Methylsulfonylmethane Tablets; Methylsulfonylmethane Tablets.

Proprietary Preparations (details are given in Part 3)

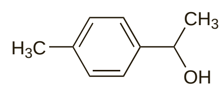
Multi-ingredient: ***Canad.:*** Glucosamine Joint & Muscle Cream with MSM†; ***Indon.:*** Aptivium Optimum Joint Formula; Artriox; Artritin; Maxitrin; Naturica Artro Plus; OA Plus; Osteoflam; Osteokom; Osteokom Forte; Osteor Plus; Osvion Plus; Triflexor; Triostee; Viopor-M; ***Ital.:*** Neosulfur; Osteoclar; Reumafort; ***S.Afr.:*** ProFLEX 750; ***UK:*** GlucOsamax; NatraFlex; PainEaze.

p,α-Dimethylbenzyl Alcohol

Tolinol; *p*-Tolylmethylcarbinol; Tolynolum. 1-(*p*-Tolyl)ethanol.

$C_9H_{12}O$ = 136.2.

CAS — 536-50-5.



NOTE. The name tolynol has been applied to both *p*,α-dimethylbenzyl alcohol and mephenesin (p.1897).

Profile

p,α-Dimethylbenzyl alcohol has been used as a choleretic in the treatment of hepatic disorders and is an ingredient of preparations for gastrointestinal disorders. *p*,α-Dimethylbenzyl alcohol nicotinate has also been used.

Preparations

Proprietary Preparations (details are given in Part 3)

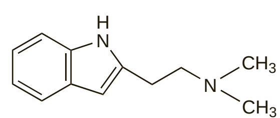
Multi-ingredient: ***Austria:*** Apozema; Galle-Donau; Spagall; Spasmo Claim.

Dimethyltryptamine

N,N-Dimethyltryptamine; Dimetiltriptamina; DMT. 3-(2-Dimethylaminoethyl)indole.

$C_{12}H_{16}N_2$ = 188.3.

CAS — 61-50-7.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of dimethyltryptamine: 45 Minute Psychosis; 45 Minute Trip; AMT; Businessman's LSD; Businessman's special; Businessman's trip; DET; Disneyland; Disneyworld; Dmitri; DMT; Fantasia; Instant psychosis; Psychosis.

Profile

Dimethyltryptamine is an active principle obtained from the seeds and leaves of *Piptadenia peregrina* (Mimosaceae) from which the hallucinogenic snuff cohoba is prepared. It may also be obtained from other South American plants. It has been reported to be present in the tropical legume *Mucuna pruriens*.

Dimethyltryptamine produces hallucinogenic and sympathomimetic effects that are similar to those of lysergide (p.2335), but of shorter duration. It has no therapeutic use. Related synthetic hallucinogens subject to abuse include:

- diethyltryptamine (DET)
- dipropyltryptamine (DPT)
- 5-methoxy-*N,N*-diisopropyltryptamine (5-MeO-DiPT; Foxy; Foxy Methoxy; Methoxy Foxy)

◊ References.

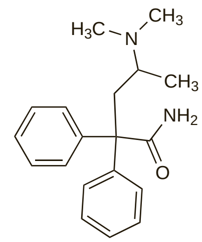
Dimevamide *(rINN)*

Aminopentamide; Dimevamida; Dimévamide; Dimevamidum. α-[2-(Dimethylamino)propyl]-α-phenylbenzeneacetamide.

Димевамид

$C_{19}H_{24}N_2O$ = 296.4.

CAS — 60-46-8.



Dimevamide Sulfate *(rINNM)*

Aminopentamide Sulfate; Dimévamide, Sulfate de; Dimevamidi Sulfas; Sulfato de dimevamida.

Димевамида Сульфат

$C_{19}H_{24}N_2O,H_2SO_4$ = 394.5.

CAS — 35144-63-9 (xH_2SO_4).

Pharmacopoeias. In *US* for veterinary use only.

Profile

Dimevamide is a tertiary amine and has been used as an antimuscarinic.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***S.Afr.:*** Kantrexil.

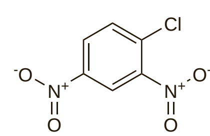
2,4-Dinitrochlorobenzene

2,4-Dinitroclorobenceno; DNCB. 1-Chloro-2,4-dinitrobenzene.

2,4-Динитрохлорбензол

$C_6H_3ClN_2O_4$ = 202.6.

CAS — 97-00-7.



Profile

2,4-Dinitrochlorobenzene is a potent sensitiser that has been applied topically in the evaluation of delayed hypersensitivity. It has also been used as an immunostimulant in various conditions including some forms of cancer, and in the treatment of alopecia and warts. It has also been investigated in HIV infection and leprosy.

2,4-Dinitrochlorobenzene has been reported to be mutagenic *in vitro*.

Diolamine *(pINN)*

Diaethanolamin; Dietanoloamina; Diethanolamine; Diolamina; Diolaminum. Bis(2-hydroxyethyl)amine; 2,2′-Iminobisethanol.

Диоламин

$C_4H_{11}NO_2$ = 105.1.

CAS — 111-42-2.

Pharmacopoeias. In *USNF.*

USNF 26 (Diethanolamine). It is a mixture of olamines, consisting largely of diolamine. White or clear, colourless crystals, deliquescing in moist air, or a colourless liquid. Miscible with water, with alcohol, with acetone, with chloroform, and with glycerol; slightly soluble to insoluble in ether, in petroleum spirit, and in benzene. Store in airtight containers. Protect from light.

Profile

Diolamine is an organic base that is used as an emulsifier and dispersant.

It is used to solubilise fusidic acid and sulfafurazole by the formation of the diolamine salt. It has been used for the preparation of salts of iodinated organic acids used as contrast media. It may be irritating to the skin and mucous membranes.

Dioxins

Dioxinas.

NOTE. The name Dioxin has also been applied to dimethoxane.

Profile

The term 'dioxins' encompasses a large group of closely related chemicals known as polychlorinated dibenzo-*p*-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs). The most toxic is 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD).

Dioxins are byproducts in the manufacture of commercial chemical products such as chlorinated phenols and polychlorinated biphenyls (PCBs), and can also be produced in smaller quantities by combustion processes and industrial waste. They first came to public attention during the Vietnam war, when they were found to be present in the herbicide Agent Orange used as a defoliant. They are incriminated as causing chloracne (a severe and persistent acne caused by chlorinated compounds). They are potent teratogens and carcinogens in *animals*. An increased incidence of cancer at different organs due to dioxins has been claimed but this has not been substantiated by clinical and follow-up studies. An effect on cell-mediated immunity has been observed.

Exposure should be limited to the lowest feasible concentration.

Adverse effects. The impact of dioxins in food and the environment has been reviewed.[1-4]

An excess of soft tissue sarcomas was found in workers exposed to chlorophenoxy herbicides including those contaminated with TCDD,[5] but cautious interpretation of these results was advised.[6] In Vietnam veterans the risk of non-Hodgkin's lymphoma was about 50% higher than control subjects, but was not related to exposure to Agent Orange, nor was there evidence for an increase in other cancers.[7] Exposure to TCDD was implicated in an increase in cancer mortality in chemical workers,[8,9] but confounding factors such as smoking may have been present.[9,10] Other studies[11,12] have not shown an association between dioxin exposure and an increase in the incidence of human cancer, and epidemiological studies after occupational or accidental exposures have found no clear persistent systemic effects, except for chloracne, and no clear association with carcinogenesis or reproductive disorders.[1,2] Decreased plasma immunoglobulin G concentrations were measured in people after exposure to TCDD 20 years earlier as a result of accidental environmental contamination in Seveso, Italy.[13] A statistically significant increase in the incidence of breast cancer related to serum levels of TCDD was observed in a cohort of 981 women who ranged in age from infancy to 40 years in 1976 at the time of the Seveso accident.[14] The authors pointed out that this cohort is relatively young and continued follow-up would clarify any possible pathogenic role of TCDD.

In the USA, the National Academy of Sciences' Institute of Medicine is reported to have carried out an evaluation of publications on herbicide exposure, largely in industrial and agricultural workers.[15] They concluded that exposure to herbicides or dioxin was associated with soft-tissue sarcomas, Hodgkin's disease, non-Hodgkin lymphoma, chloracne, and porphyria cutanea tarda, and that there was limited evidence of an association with respiratory and prostate cancers and multiple myeloma. An update to the report has also suggested a link between Agent Orange exposure and spina bifida in veterans' offspring.[16] There is some evidence that exposure of men to TCDD is associated with a decreased male to female sex ratio in their offspring.[17] Results from studies[18-20] suggest that prenatal exposure to PCBs has an effect on mental and motor development in early childhood, although this may be counteracted by an advantageous home environment. However, virtually no adverse effects in relation to postnatal exposure to PCBs present in breast milk were demonstrated.[20]

Diphemanil Metilsulfate *(BAN, rINN)*

Diphemanil Methylsulfate; Diphemanil Methylsulphate; Diphémanil, Métilsulfate de; Diphemanili Metilsulfas; Diphenmethanil Methylsulphate; Metilsulfato de difemanilo; Vagophemanil Methylsulphate. 4-Benzhydrylidene-1,1-dimethylpiperidinium methylsulphate.

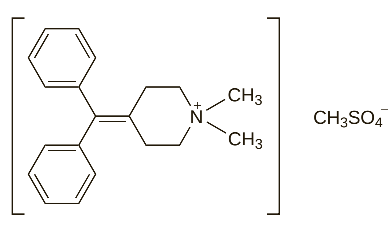
Дифеманила Метилсульфат

$C_{20}H_{24}N,CH_3SO_4$ = 389.5.

CAS — 62-97-5.

ATC — A03AB15.

ATC Vet — QA03AB15.



Profile

Diphemanil metilsulfate is a quaternary ammonium antimuscarinic with peripheral effects similar to those of atropine (p.1219). It is used topically as a 2% cream or powder to treat hyperhidrosis (p.1580).

Diphemanil metilsulfate, given orally, has been used for the treatment of symptomatic bradycardia in infants.

Preparations

Proprietary Preparations (details are given in Part 3)

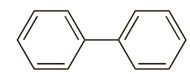
Austral.: Prantal; ***Chile:*** Nivelon†; ***Ital.:*** Prantal†; ***NZ:*** Prantal.

Diphenyl

Difenilo; E230; Phenylbenzene. Biphenyl.

$C_{12}H_{10}$ = 154.2.

CAS — 92-52-4.



Profile

Diphenyl is fungistatic against a limited number of moulds and has been employed for impregnating the material used for wrapping citrus fruits.

Adverse effects. Workers exposed to high concentrations of diphenyl (up to 128 mg/m^3) developed toxic symptoms that included irritation of the throat and eyes, headache, nausea, diffuse abdominal pain, numbness, aching of limbs, and general fatigue.[1] One of the workers, who also had somnolence, icterus, ascites, and oedema of the legs, died; at autopsy, the liver showed necrosis. Chronic hepatitis was reported in a woman exposed over a 25-year period to diphenyl in the paper used to pack citrus fruit.[2]

Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *US.*

Ph. Eur. 6.2 (Dipivefrine Hydrochloride). A white or almost white crystalline powder. Freely soluble in water, in alcohol, and in dichloromethane; very soluble in methyl alcohol.

USP 31 (Dipivefrin Hydrochloride). White, crystalline powder or small crystals, having a faint odour. Very soluble in water. Store in airtight containers.

Profile

Dipivefrine is an ester and prodrug of adrenaline (p.1203). A 0.1% solution of the hydrochloride is used topically as eye drops to reduce intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension (p.1873).

Pharmacopoeias. In *Eur.* (see p.vii), *Jpn*, and *US.*

Ph. Eur. 6.2 (Disulfiram). A white or almost white, crystalline powder. M.p. 70° to 73°. Practically insoluble in water; sparingly soluble in alcohol; freely soluble in dichloromethane. Protect from light.

USP 31 (Disulfiram). A white to off-white, odourless crystalline powder. M.p. 69° to 72°. Very slightly soluble in water; soluble 1 in 30 of alcohol and 1 in 15 of ether; soluble in acetone, in carbon disulfide, and in chloroform. Store in airtight containers. Protect from light.

Stability. Studies[1,2] on the stability of disulfiram preparations.

1. Gupta VD. Stability of aqueous suspensions of disulfiram. *Am J Hosp Pharm* 1981; **38:** 363–4.
2. Philips M, *et al.* Stability of an injectable disulfiram formulation sterilized by gamma irradiation. *Am J Hosp Pharm* 1985; **42:** 343–5.

Adverse Effects and Treatment

Drowsiness and fatigue are common during initial treatment with disulfiram. Other adverse effects reported include a garlic-like or metallic aftertaste, gastrointestinal upsets, body odour, bad breath, headache, impotence, and allergic dermatitis. Peripheral and optic neuropathies, psychotic reactions, and hepatotoxicity may occur.

Disulfiram-alcohol reaction. The use of disulfiram in the management of alcoholism is based on the extremely unpleasant, but generally self-limiting, systemic effects which occur when a patient receiving the drug ingests alcohol. These effects begin with flushing of the face and, as vasodilatation spreads, throbbing in the head and neck and a pulsating headache may develop. Respiratory difficulties, nausea, copious vomiting, sweating, thirst, chest pain, tachycardia, palpitations, marked hypotension, giddiness, weakness, blurred vision, and confusion may follow. The intensity and duration of symptoms is very variable and even small quantities of alcohol may result in alarming reactions. In addition to the above effects, severe reactions have included respiratory depression, cardiovascular collapse, cardiac arrhythmias, myocardial infarction, acute heart failure, unconsciousness, convulsions, and sudden death.

Severe reactions require intensive supportive therapy; oxygen and intravenous fluids may be necessary. Potassium concentrations should be monitored. Giving intravenous ascorbic acid, ephedrine sulfate, or antihistamines has been suggested.

◊ Reviews.

1. Chick J. Safety issues concerning the use of disulfiram in treating alcohol dependence. *Drug Safety* 1999; **20:** 427–35.

Effects on the blood. There were isolated reports of blood dyscrasias associated with disulfiram in the 1960s. US licensed product information recommends that blood counts should be performed during treatment.

Effects on the liver. A review of 18 cases of hepatitis in patients receiving disulfiram.[1] Symptoms have appeared between 10 days and 6 months after starting disulfiram, and clinical improvement has been seen within 2 weeks of stopping the drug, although liver enzyme values may not return to normal for several months. Fatal hepatic coma had been reported in 7 patients. The clinical picture of disulfiram-induced hepatitis is consistent with a hypersensitivity reaction. Another review[2] evaluated 82 cases of liver injury thought to be due to disulfiram and reported to the Swedish Adverse Drug Reactions Advisory Committee between 1966 and 2002. All but one of the cases were of hepatocellular liver damage, and 4 patients died and 4 underwent liver transplantation. Although there was some evidence that hypersensitivity played a role, it might not be the only mechanism of disulfiram-induced liver disease.

2. Björnsson E, *et al.* Clinical characteristics and prognostic markers in disulfiram-induced liver injury. *J Hepatol* 2006; **44:** 791–7.

Effects on the nervous system. *ENCEPHALOPATHY.* A 2% incidence of reversible toxic encephalopathy has been reported in patients receiving disulfiram.[1] Onset varies from days to months following the start of therapy and early signs include impaired concentration, memory deficits, anxiety, depression, and somnolence. Confusion and disorientation follow, often accompanied by paranoid delusions and sometimes hallucinations. Other symptoms may include ataxia, loss of fine motor coordination, slurred speech, and intention tremor. The encephalopathy usually resolves within 3 days to 2 weeks of stopping disulfiram, although symptoms may persist for 6 weeks. There are conflicting opinions on whether this psychosis is a toxic reaction to disulfiram or a response to abstinence from alcohol, but the authors suspected that most cases represent a toxic encephalopathy. However, psychosis without any suggestion of encephalopathy has been reported.[2]

1. Hotson JR, Langston JW. Disulfiram-induced encephalopathy. *Arch Neurol* 1976; **33:** 141–2.
2. Rossiter SK. Psychosis with disulfiram prescribed under probation order. *BMJ* 1992; **305:** 763.

PERIPHERAL NEUROPATHY. Reports of peripheral neuropathy associated with disulfiram and reference to previously reported cases.[1,2] Onset of neuropathy varied from days to months after starting disulfiram treatment and could develop with doses of 250 or 500 mg daily. The most common symptom reported was pins and needles, but numbness, pain/burning, and weakness were frequently described; usually both muscle weakness and sensory loss were noted. Optic atrophy has also been described. Although there might be some improvement immediately after disulfiram withdrawal, the neurological deficit only improved slowly and symptoms might persist for as long as 2 years.[1]

1. Watson CP, *et al.* Disulfiram neuropathy. *Can Med Assoc J* 1980; **123:** 123–6.
2. Frisoni GB, Di Monda V. Disulfiram neuropathy: a review (1971-1988) and report of a case. *Alcohol Alcohol* 1989; **24:** 429–37.

Effects on the respiratory tract. Bronchospasm and hypertension were observed in an asthmatic patient taking disulfiram after an alcohol challenge test.[1]

1. Zapata E, Orwin A. Severe hypertension and bronchospasm during disulfiram-ethanol test reaction. *BMJ* 1992; **305:** 870.

Effects on the skin. Orange-coloured palms and soles, provoking an initial diagnosis of jaundice, developed in a 55-year-old man who had been taking disulfiram for about 2 months.[1] It was postulated that the discoloration was due to accumulation of carotenes in the skin as a result of inhibition of vitamin A metabolism by disulfiram. The discoloration disappeared soon after disulfiram was stopped.

1. Santonastaso M, *et al.* Yellow palms with disulfiram. *Lancet* 1997; **350:** 266.

Overdosage. There has been a report of a 6-year-old boy who experienced disulfiram intoxication after receiving disulfiram 250 mg four times daily to a total of 13 doses but who later recovered.[1] Of 6 previous reports one child died and 3 had moderate or severe brain damage. The syndrome of disulfiram intoxication in children is distinct from the disulfiram-alcohol interaction or acute disulfiram intoxication in adults. It is characterised by lethargy or somnolence, weakness, hypotonia, and vomiting, beginning about 12 hours after ingestion and progressing to stupor or coma. Dehydration, moderate tachycardia, and marked tachypnoea occur frequently, muscle tone is greatly decreased, and deep-tendon reflexes may be weak or absent.

Severe neurological damage has also been reported[2] in a 5-year-old girl after acute disulfiram intoxication which was initially diagnosed as diabetic ketoacidosis.

1. Benitz WE, Tatro DS. Disulfiram intoxication in a child. *J Pediatr* 1984; **105:** 487–9.
2. Mahajan P, *et al.* Basal ganglion infarction in a child with disulfiram poisoning. *Pediatrics* 1997; **99:** 605–8.

Precautions

Disulfiram is contra-indicated in the presence of cardiovascular disease or psychosis or severe personality disorders, and should not be given to patients known to be hypersensitive to it or to other thiuram compounds, such as those used in rubber vulcanisation or pesticides. It should be used with caution in the presence of diabetes mellitus, epilepsy, impaired hepatic or renal function, respiratory disorders, cerebral damage, or hypothyroidism. Caution is also advised when giving disulfiram to those who are addicted to other drugs in addition to alcohol. It is probably best avoided in pregnancy.

Disulfiram should not be given until at least 24 hours after the last ingestion of alcohol. Patients beginning therapy should be fully aware of the disulfiram-alcohol reaction and should be warned to avoid alcohol in any form, including alcohol-containing medicines and alcohol-based topical preparations. Reactions to alcohol may occur as long as 2 weeks after the cessation of disulfiram.

The US manufacturers have recommended that regular blood counts and liver function tests should be performed during long-term therapy.

Pregnancy. A report of 2 infants with severe limb-reduction anomalies whose mothers had taken disulfiram during pregnancy.[1] Only 2 similar cases had previously been reported.

1. Nora AH, *et al.* Limb-reduction anomalies in infants born to disulfiram-treated alcoholic mothers. *Lancet* 1977; **ii:** 664.

Interactions

Disulfiram inhibits hepatic enzymes and may interfere with the metabolism of other drugs taken at the same time. It enhances the effects of phenytoin and coumarin anticoagulants and their dosage may need to be reduced. It also inhibits the metabolism and excretion of rifampicin. Toxic reactions have occurred when disulfiram was given with isoniazid or metronidazole. Disulfiram may inhibit the metabolism of paraldehyde leading to an accumulation of acetaldehyde and these drugs should not be used together.

◊ In a study[1] to evaluate the effects of disulfiram on cytochrome P450 isoenzymes, the results suggested that disulfiram-mediated inhibition is mainly selective for CYP2E1 after both acute and chronic dosage.

1. Frye RF, Branch RA. Effect of chronic disulfiram administration on the activities of CYP1A2, CYP2C19, CYP2D6, CYP2E1, and N-acetyltransferase in healthy human subjects. *Br J Clin Pharmacol* 2002; **53:** 155–62.

Analgesics. The potential of disulfiram to impair drug metabolism was shown[1] when it was found to prolong the plasma half-life of *phenazone*, probably by inhibiting the hepatic microsomal mixed function oxidases. It was also suggested[1] that disulfiram alters catecholamine metabolism since urinary excretion of vanilmandelic acid was significantly reduced and that of homovanillic acid was increased.

1. Vesell ES, *et al.* Impairment of drug metabolism by disulfiram in man. *Clin Pharmacol Ther* 1971; **12:** 785–92.

Antidepressants. It has been reported[1] that *amitriptyline* appeared to enhance the disulfiram-alcohol reaction. There is the potential for serious interactions during the disulfiram-alcohol reaction with drugs having CNS actions mediated by noradrenaline or dopamine, such as *tricyclic antidepressants* or those inhibiting the same enzymes as disulfiram, such as *MAOIs*.[2]

1. MacCallum WAG. Drug interactions in alcoholism treatment. *Lancet* 1969; **i:** 313.
2. Sellers EM, *et al.* Drugs to decrease alcohol consumption. *N Engl J Med* 1981; **305:** 1255–62.

Antiprotozoals. For reference to toxicity associated with *metronidazole* given to alcoholic patients who were also receiving disulfiram, see Alcohol, under Interactions of Metronidazole, p.838.

Antipsychotics. It has been suggested[1] that phenothiazine antiemetics such as *chlorpromazine* might increase hypotension because of their α-adrenoceptor blocking activity and should therefore be contra-indicated in patients taking disulfiram. There is the potential for serious interactions during the disulfiram-alcohol reaction with drugs having CNS actions mediated by noradrenaline or dopamine, such as *phenothiazines*.[2]

1. Kwentus J, Major LF. Disulfiram in the treatment of alcoholism: a review. *J Stud Alcohol* 1979; **40:** 428–46.
2. Sellers EM, *et al.* Drugs to decrease alcohol consumption. *N Engl J Med* 1981; **305:** 1255–62.

Benzodiazepines. *Diazepam* was reported[1] to reduce the intensity of the disulfiram-alcohol reaction.

1. MacCallum WAG. Drug interactions in alcoholism treatment. *Lancet* 1969; **i:** 313.

Cannabis. For a suggestion that a combination of disulfiram and *cannabis* may produce a hypomanic state, see p.2275.

Cardiovascular drugs. Clinically serious pharmacodynamic interactions might be anticipated during the disulfiram-alcohol reaction in patients taking other drugs that impair blood pressure regulation, such as *alpha blockers*, *beta blockers*, or *vasodilators*.[1]

1. Sellers EM, *et al.* Drugs to decrease alcohol consumption. *N Engl J Med* 1981; **305:** 1255–62.

Macrolides. Fatal toxic epidermal necrolysis and fulminant hepatitis have been reported[1] after starting *clarithromycin* treatment in a patient who was receiving disulfiram.

1. Masiá M, *et al.* Fulminant hepatitis and fatal toxic epidermal necrolysis (Lyell disease) coincident with clarithromycin administration in an alcoholic patient receiving disulfiram therapy. *Arch Intern Med* 2002; **162:** 474–6.

Pharmacokinetics

Disulfiram is absorbed variably from the gastrointestinal tract and is rapidly reduced to diethyldithiocarbamate (ditiocarb, p.1445), principally by the glutathione reductase system in the erythrocytes; reduction may also occur in the liver. Diethyldithiocarbamate is metabolised in the liver to its glucuronide and methyl ester and to diethylamine, carbon disulfide, and sulfate ions. Metabolites are excreted primarily in the urine; carbon disulfide is exhaled in the breath.

◊ There was marked intersubject variability in plasma concentrations of disulfiram and its metabolites in a study of 15 male alcoholics given single 250-mg doses of disulfiram by mouth and repeated dosing with 250 mg daily for 12 days.[1] Variability might result from the marked lipid solubility of disulfiram, differences in plasma protein binding, or enterohepatic cycling. Average times to reach peak plasma concentrations after single or repeated doses were 8 to 10 hours for disulfiram, diethyldithiocarbamate, diethyldithiocarbamate-methyl ester, and diethylamine, and for carbon disulfide in breath; peak plasma concentrations of carbon disulfide occurred after 5 to 6 hours. Plasma concentrations of disulfiram were negligible within 48 hours of a dose, although concentrations of some metabolites were still raised. In urine, 1.7 and 8.3% of a disulfiram dose was eliminated as diethyldithiocarbamate-glucuronide in the 24 hours after a single and repeated dose respectively, while diethylamine accounted for 1.6 and 5.7%, respectively. In the 24 hours after a single and repeated dose 22.4 and 31.3%, respectively, was eliminated as carbon disulfide in the breath.

1. Faiman MD, *et al.* Elimination kinetics of disulfiram in alcoholics after single and repeated doses. *Clin Pharmacol Ther* 1984; **36:** 520–6.

Uses and Administration

Disulfiram is used as an adjunct in the treatment of chronic alcoholism (see Alcohol Withdrawal and Abstinence, p.1626). Disulfiram is not a cure and the treatment is likely to be of little value unless it is undertaken with the willing cooperation of the patient and is used with supportive psychotherapy.

Disulfiram inhibits aldehyde dehydrogenase, the enzyme responsible for the oxidation of acetaldehyde, a metabolite of alcohol. The resulting accumulation of acetaldehyde in the blood is widely believed to be responsible for many of the unpleasant symptoms of the disulfiram-alcohol reaction which occur when alcohol is taken, even in small quantities, after disulfiram (see Adverse Effects and Treatment, above). Symptoms can arise within 10 minutes of the ingestion of alcohol and last from half an hour in mild cases to several hours in severe cases. It is advisable to carry out the initial treatment in hospital or in a specialised unit where the patient can be kept under close supervision.

Disulfiram is given by mouth. In the UK, the dose is 800 mg, taken as a single dose, on the first day of treatment, reduced by 200 mg daily to a maintenance dose which is usually 100 to 200 mg daily. In the USA, where doses above 500 mg daily are not recommended, an initial dose of 500 mg daily for 1 to 2 weeks is given, followed by a maintenance dose of 250 mg daily or within the range of 125 to 500 mg daily. Treatment should be reviewed after no longer than 6 months. Maintenance therapy with disulfiram may need to be continued for months or years, until the patient is fully recovered socially and a basis for permanent self-control has been established.

A test dose of alcohol has been given under close supervision when the patient is receiving maintenance doses of disulfiram, in order to demonstrate the nature of the disulfiram-alcohol reaction. However, these challenge tests are not routinely recommended, and should not in any case be used in patients over 50 years of age. Many authorities consider that an explicit description of the reaction is sufficient.

Disulfiram implants have been used in an attempt to overcome problems of patient compliance but have been largely abandoned due to lack of clinical efficacy.

Dizocilpine Maleate *(USAN, rINNM)*

Dizocilpine, Maléate de; Dizocilpini Maleas; Maleato de dizocilpina; MK-801. (+)-10,11-Dihydro-5-methyl-5*H*-dibenzo[*a*,*d*]-cyclohepten-5,10-imine maleate.

Дизоцилпина Малеат

$C_{16}H_{15}N,C_4H_4O_4 = 337.4.$

CAS — 77086-21-6 (dizocilpine); 77086-22-7 (dizocilpine maleate).

Profile

Dizocilpine is an antagonist of the excitatory neurotransmitter *N*-methyl-D-aspartate (NMDA). It has been investigated for its antiepileptic properties as well as for a potential role in various other neurological disorders including the prevention of damage due to cerebral ischaemia.

◊ Dizocilpine has good anticonvulsant activity but as it causes alarming psychotropic effects it was abandoned as a possible therapy for epilepsy.[1] Interest in its use as a possible therapy for stroke continued.

Drosera

Droséra; Droserae herba; Herba Rorellae; Rorela; Ros Solis; Rossolis; Sonnentau; Sundew.

Profile

Drosera consists of the air-dried entire plant *Drosera rotundifolia* (Droseraceae) and other *Drosera* spp. Preparations of drosera have been used for its reputed value in respiratory disorders.

Homoeopathy. Drosera has been used in homoeopathic medicines under the following names: Drosera rotundifolia; Dros rot.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Makatussin Saft Drosera†; Makatussin Tropfen Drosera†.

Multi-ingredient: ***Austral.:*** Asa Tones; ***Austria:*** Pilka; Pilka Forte; ***Belg.:*** Saintbois; ***Chile:*** Fitotos; Gotas Nican†; Notosil†; Pectoral Pasteur; Pulmagol; Ramistos; Sedotus†; ***Cz.:*** Bronchicum Pflanzlicher Hustenstiller†; Stodal; Tussilen; ***Fr.:*** Pastilles Monleon; Tussidoron; ***Ger.:*** Bronchicum Pflanzlicher†; Drosithym-N; Lomal†; Makatussin Tropfen forte†; Tussiflorin Hustenstiller†; ***Indon.:*** Silex; ***Israel:*** Pilka; ***Mex.:*** Citos; Fen-y-Tos; ***Port.:*** Broncodiazina; Pilka F†; ***S.Afr.:*** Cough Elixir; ***Spain:*** Broncovital†; Pazbronquial; Pilka; ***Switz.:*** Bromocod N; Bronchofluid N†; Demo Elixir pectoral N; DemoTussil; Dragees S contre la toux†; Drosinula†; Escotussin; Famel; Gouttes contre la toux "S"; Makaphyt Gouttes antitussives; Makaphyt Sirop; Nican; Pastilles bronchiques S nouvelle formule; Pastilles pectorales Demo N; Pilka†; Sirop pectoral contre la toux S; Sirop S contre la toux et la bronchite; Thymodrosin N†; Tussanil Compositum†; ***Venez.:*** Codebromil; Dromil Sauco; Pi-Fedrin.

Drotaverine *(rINN)*

Drotaverina; Drotavérine; Drotaverinum. 1-(3,4-Diethoxybenzylidene)-6,7-diethoxy-1,2,3,4-tetrahydroisoquinoline.

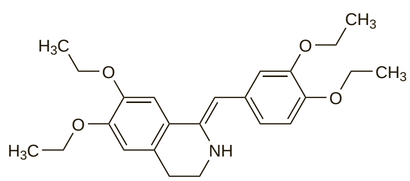
Дротаверин

$C_{24}H_{31}NO_4$ = 397.5.

CAS — 14009-24-6 (drotaverine); 985-12-6 (drotaverine hydrochloride).

ATC — A03AD02.

ATC Vet — QA03AD02.



Pharmacopoeias. *Pol.* includes Drotaverine Hydrochloride.

Profile

Drotaverine is used as an antispasmodic in the management of biliary-tract, urinary-tract, and gastrointestinal spasm, in usual oral doses of 120 to 240 mg daily in divided doses. It has also been given by intramuscular or intravenous injection.

◊ References.

Porphyria. Drotaverine has been associated with acute attacks of porphyria and is considered unsafe in porphyric patients.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: Proconfial†; ***Cz.:*** No-Spa; ***Hung.:*** No-Spa; ***India:*** Drotin; Drovera†; DVN; ***Malaysia:*** No-Spa; ***Philipp.:*** No-Spa; ***Pol.:*** Galospa; No-Spa; ***Rus.:*** Bезра (Беспа); No-Spa (Но-Шпа); Spacovin (Спаковин); Spasmol (Спазмол); Spazoverin (Спазоверин); ***Thai.:*** D-Tarine†; Deolin; No-Spa; Spablock; Spacovin; Sparax; Sparta; Toverine.

Multi-ingredient: ***Cz.:*** Quarelin†; ***Hung.:*** Algoflex-M; Algopyrin Complex; No-Spalgin; Paniverin; Quarelin; ***Rus.:*** No-Spalgin (Но-Шпалгин).

Dulcamara

Bittersüss; Bittersweet; Douce-Amère; Dulcamarae Caulis; Woody Nightshade.

Profile

Dulcamara consists of the dried stems and branches of *Solanum dulcamara* (Solanaceae). It was formerly a popular remedy for chronic rheumatism and skin eruptions and was given as an infusion.

All parts of the plant are poisonous due to the presence of solanaceous alkaloids. The berries have caused poisoning in children. Adverse effects are treated as described under Atropine, p.1220.

Homoeopathy. Dulcamara has been used in homoeopathic medicines under the following names: Solanum dulcamara; Dulc.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Cefabene; Solapsor†.

Multi-ingredient: ***Austria:*** Dermatodoron; ***Ger.:*** Dermatodoron; ***S.Afr.:*** Cough Elixir; Dermatodoron.

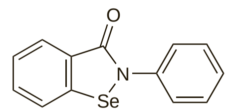
Ebselen *(rINN)*

DR-3305; Ebsélène; Ebseleno; Ebselenum; PZ-51. 2-Phenyl-1,2-benzisoselenazolin-3-one.

Эбселен

$C_{13}H_9NOSe$ = 274.2.

CAS — 60940-34-3.



Profile

Ebselen has antoxidant activity and inhibits lipid peroxidation. It has been investigated as a neuroprotectant in stroke.

◊ References.

Echinacea

Black Sampson; Blyškiųjų ežiuolių šaknys (pale coneflower root); Brauneria; Coneflower; Echinacea angustifolia, racine d' (narrow-leaved coneflower root); Echinacea pallida, racine d' (pale coneflower root); Echinacea purpurea, parties aériennes fleuries d' (purple coneflower herb); Echinacea purpurea, racine d' (purple coneflower root); Echinaceae angustifoliae radix (narrow-leaved coneflower root); Echinaceae pallidae radix (pale coneflower root); Echinaceae purpureae herba (purple coneflower herb); Echinaceae purpureae radix (purple coneflower root); Equinácea; Kaitapäivänhatunjuuri (narrow-leaved coneflower root); Kořen třapatky bledé (pale coneflower root); Kořen třapatky úzkolisté (narrow-leaved coneflower root); Läkerudbeckiarot (pale coneflower root); Liten läkerudbeckiarot (narrow-leaved coneflower root); Rohtopäivänhatunjuuri (pale coneflower root); Rudbeckia; Siauralapių ežiuolių šaknys (narrow-leaved coneflower root); Sonnenhutkraut.

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Narrow-Leaved Coneflower Root; Echinaceae Angustifoliae Radix). The dried, whole, or cut underground parts of *Echinacea angustifolia*. It contains a minimum 0.5% of echinacoside ($C_{35}H_{46}O_{20}$ = 786.7), calculated with reference to the dried drug. Store uncomminuted. Protect from light.

Ph. Eur. 6.2 (Pale Coneflower Root; Echinaceae Pallidae Radix). The dried, whole, or cut underground parts of *Echinacea pallida*. It contains a minimum 0.2% of echinacoside calculated with reference to the dried drug. Store uncomminuted. Protect from light.

Ph. Eur. 6.2 (Purple Coneflower Herb; Echinaceae Purpureae Herba). The dried, whole or cut flowering aerial parts of *Echinacea purpurea*. It contains a minimum of 0.1% of the sum of caftaric acid ($C_{13}H_{12}O_9$ = 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$ = 474.4). Store uncomminuted.

Ph. Eur. 6.2 (Purple Coneflower Root; Echinaceae Purpureae Radix). The dried, whole or cut underground parts of *Echinacea purpurea*. It contains a minimum of 0.5% of the sum of caftaric acid ($C_{13}H_{12}O_9$ = 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$ = 474.4). Store uncomminuted.

USP 31 (Echinacea Angustifolia). It consists of the dried rhizome and roots of *Echinacea angustifolia* (Asteraceae), harvested in the autumn after 1 or more years of growth. It contains not less than 0.5% of total phenols. Protect from light.

USP 31 (Echinacea Pallida). It consists of the dried rhizome and roots of *Echinacea pallida* (Asteraceae), harvested in the autumn after 3 or more years of growth. It contains not less than 0.5% of total phenols. Protect from light.

USP 31 (Echinacea Purpurea Root). It consists of the dried rhizome and roots of *Echinacea purpurea* (Asteraceae), harvested in the autumn after 3 or more years of growth. It contains not less than 0.5% of total phenols. Protect from light.

USP 31 (Echinacea Purpurea Aerial Parts). The aerial parts of *Echinacea purpurea* (Asteraceae) harvested during the flowering stage. It contains not less than 1.0% of chicoric acid, and not less than 0.01% of dodecatetraenoic acid isobutylamides ($C_{16}H_{25}NO$), calculated on the dried basis. Store in airtight containers. Protect from light.

Profile

Echinacea, the dried, whole, or cut underground parts of *Echinacea angustifolia* (*Brauneria angustifolia*), *E. pallida* (*B. pallida*), or *E. purpurea*, or the aerial parts of *E. purpurea*, is reported to have immunostimulant properties. It is used in herbal preparations for the prophylaxis of bacterial and viral infections.

Homoeopathy. Echinacea has been used in homoeopathic medicines under the following names: Echinacea purpurea; Echinacea purpurea ex planta tota; Echinacea purpurea, Planta tota; Echinacea angustifolia; Echin. an.

Adverse effects. The most common adverse effects reported on short-term use of echinacea were gastrointestinal and skin-related; these were generally transient and reversible.[1] Hypersensitivity reactions including anaphylaxis have been reported.[1-4]

Pharmacokinetics. The pharmacokinetics of alkamides extracted from *Echinacea angustifolia* roots have been studied[1] in human subjects. Fast absorption of some alkamides was shown after oral use; highly lipophilic alkamides could not be detected in plasma.

1. Woelkart K, *et al.* Bioavailability and pharmacokinetics of alkamides from the roots of Echinacea angustifolia in humans. *J Clin Pharmacol* 2005; **45:** 683–9.

Use in respiratory disorders. Echinacea is widely used in herbal preparations to treat upper respiratory-tract infections such as the common cold. Studies[1-3] have produced conflicting results, but systematic reviews suggest that most have methodological flaws[4] rendering evidence of efficacy unconvincing.[4,5] A meta-analysis[6] of 14 randomised controlled studies suggested that echinacea does have a benefit in decreasing the incidence and duration of the common cold, although it was acknowledged that larger prospective studies controlling for several variables (e.g. species) are needed before it can be routinely recommended. Comparative evaluation of specific preparations is also difficult because of varying composition. Evaluation of the effect of 3 extracts of *Echinacea angustifolia* root, each produced by a different extraction method and with defined phytochemical profiles, demonstrated no clinically significant effects by any of them on experimental rhinovirus infection or ensuing illness compared with placebo.[7] Alkamides, polysaccharides, and caffeic acid derivatives, which have been proposed as the active components of echinacea preparations, were present in varying amounts in the extracts.

Eculizumab *(USAN, rINN)*

Éculizumab; Eculizumabum; h5G1.1. Immunoglobulin, anti-(human complement C5 α-chain) (human-mouse monoclonal 5G1.1 heavy chain), disulfide with human-mouse monoclonal 5G1.1 light chain, dimer.

Экулизумаб

CAS — 219685-50-4.
ATC — L04AA25.
ATC Vet — QL04AA25.

Profile

Eculizumab is a recombinant humanised monoclonal antibody that acts as a complement blocker (p.2286) by inhibiting terminal complement activation at the C5 protein. It is used to reduce haemolysis in patients with paroxysmal nocturnal haemoglobinuria, a severe and disabling form of haemolytic anaemia (p.1043). Eculizumab is given by intravenous infusion over 25 to 45 minutes in a dose of 600 mg every 7 days for the first 4 weeks, followed by 900 mg 7 days later, and then 900 mg every 14 days thereafter. The infusion should be diluted to 5 mg/mL in sodium chloride 0.45% or 0.9%, glucose 5%, or Ringer's injection. The infusion rate may be decreased in the event of infusion reactions but the total infusion time should not exceed 2 hours; the infusion may be stopped in severe reactions. Patients should be monitored for at least one hour after the infusion for signs of infusion reactions. Patients who stop treatment altogether are at increased risk for serious haemolysis and should be monitored for 8 weeks.

Use of eculizumab increases susceptibility to meningococcal infections and patients who are not up to date with their meningococcal vaccinations should be vaccinated at least 2 weeks before receiving the first dose of eculizumab and receive booster vaccinations according to current guidelines. Patients should be monitored during treatment for early signs of meningococcal infections and treated as required. Susceptibility to other infections may also increase and eculizumab should be used with caution in patients with systemic infection. Other adverse effects that have been reported with eculizumab include headache, nasopharyngitis, back pain, and nausea.

Preparations

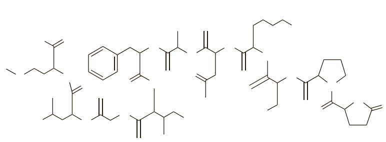
Proprietary Preparations (details are given in Part 3)
Cz.: Soliris; ***Fr.:*** Soliris; ***Port.:*** Soliris; ***UK:*** Soliris; ***USA:*** Soliris.

Eledoisin *(rINN)*

ELD-950; Eledoisina; Élédoïsine; Eledoisinum. 5-Oxo-Pro-Pro-Ser-Lys-Asp-Ala-Phe-Ile-Gly-Leu-Met-NH_2.

Элeдоизин

$C_{54}H_{85}N_{13}O_{15}S$ = 1188.4.
CAS — 69-25-0 (eledoisin); 10129-92-7 (eledoisin trifluoroacetate).



Profile

Eledoisin is a peptide extracted from the posterior salivary glands of certain small octopuses (*Eledone* spp., Mollusca), or obtained by synthesis. Its actions resemble those of substance P; it is a potent vasodilator and increases capillary permeability. It has been given as the trifluoroacetate in eye drops to stimulate lachrymal secretion in Sjögren's syndrome and other dry eye conditions.

Preparations

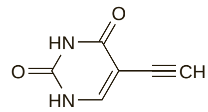
Proprietary Preparations (details are given in Part 3)
Spain: Eloisin.

Eniluracil *(BAN, USAN, rINN)*

776C85; Eniluracilo; Eniluracilum. 5-Ethynyluracil.

Энилурацил

$C_6H_4N_2O_2$ = 136.1.
CAS — 59989-18-3.



Profile

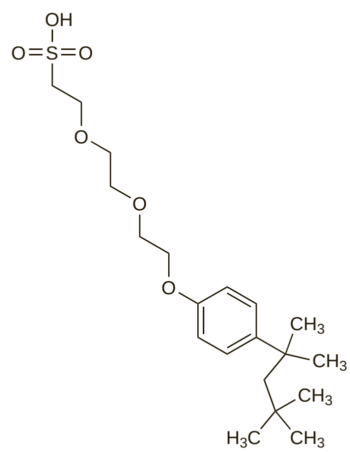
Eniluracil inactivates the enzyme dihydropyrimidine dehydrogenase, which plays an important role in the metabolism of the antineoplastic fluorouracil (p.723). Eniluracil increases the bioavailability of fluorouracil, particularly when the latter is given by mouth. It is being investigated as an adjunct to fluorouracil therapy in the treatment of colorectal, breast, and pancreatic cancer. However, the optimal dose and regimen remains to be determined.

Entsufon Sodium *(USAN, rINNM)*

Entsufón sódico; Entsufon Sodique; Natrii Entsufonum. Sodium 2-{2-[2-(*p*-1,3,3-tetramethylbutylphenoxy)ethoxy]ethoxy}ethanesulfonate.

Натрий Энтсуфон

$C_{20}H_{33}NaO_6S$ = 424.5.
CAS — 55837-16-6 (entsufon); 2917-94-4 (entsufon sodium).



(entsufon)

Profile

Entsufon sodium is a detergent used as a soap substitute for cleansing the skin.

Preparations

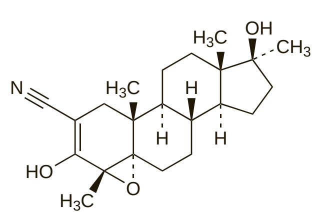
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Canad.:*** pHisoHex; ***USA:*** pHisoHex.

Epostane *(BAN, USAN, rINN)*

Épostane; Epostano; Epostanum; Win-32729. 4α,5α-Epoxy-3,17β-dihydroxy-4β,17α-dimethyl-5α-androst-2-ene-2-carbonitrile.

Эпостан

$C_{22}H_{31}NO_3$ = 357.5.
CAS — 80471-63-2.



Profile

Epostane has antiprogestogenic activity and has been investigated for use with prostaglandins in the termination of pregnancy, and as a uterine stimulant for the induction of labour.

Eprodisate Disodium *(USAN, rINNM)*

Éprodisate Disodique; Eprodisato disódico; Eprodisatum Dinatricum; NC-503. Disodium propane-1,3-disulfonate.

Динатрий Эпродисат

$C_3H_6Na_2O_6S_2$ = 248.2.
CAS — 36589-58-9.

(eprodisate)

Profile

Eprodisate disodium is a glycosaminoglycan mimetic under investigation for the prevention of amyloid fibril formation and deposition in the treatment of AA amyloidosis.

◊ References.

1. Dember LM, *et al.* Eprodisate for the treatment of renal disease in AA amyloidosis. *N Engl J Med* 2007; **356:** 2349–60.

Equisetum

Åkerfräken; Asiūklių žolė; Cola de Caballo; Equiseti herba; Equiseto; Herba Equiseti; Horsetail; Peltokorte; Prêle; Prêle, tige de; Přesličková nať; Schachtelhalmkraut; Ziele skrzypu.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Equisetum Stem; Horsetail BP 2008). The whole or cut, dried sterile aerial parts of *Equisetum arvense*. It contains a minimum of 0.3% of total flavonoids expressed as isoquercitroside ($C_{21}H_{20}O_{12}$ = 464.4), calculated with reference to the dried drug.

Profile

Equisetum is an ingredient of herbal preparations that have been used in the treatment of genito-urinary and respiratory disorders. Similar preparations have been used in the treatment of cardiovascular disorders, rheumatic disorders, liver disorders, constipation, and as a tonic.

The related species *Equisetum hiemale* is used in China for the treatment of eye disorders.

Homoeopathy. Equisetum has been used in homoeopathic medicines under the following names: Equisetum arvense.

Preparations

Proprietary Preparations (details are given in Part 3)

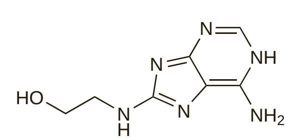
Etaden

Ethaden. 2-[(6-Amino-1*H*-purin-8-yl)amino]ethanol.

$C_7H_{10}N_6O$ = 194.2.
CAS — 66813-29-4.



Profile

Etaden is used in the form of eye drops to stimulate epithelial regrowth.

Ethanethiol

Ethyl Mercaptan Thioethyl Alcohol; Ethylmercaptan; l-Ethanethiol.

Этантиол; Этил Меркаптан

C_2H_6S = 62.13.
CAS — 75-08-1.

Profile

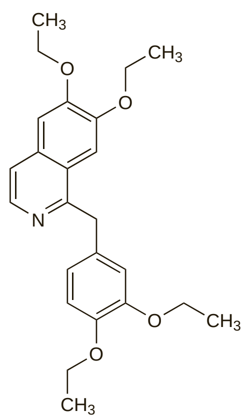
Mercaptans such as ethanethiol have an extremely disagreeable odour that is detectable by humans at very low concentrations and therefore they are added as a safety measure to odourless gases such as natural gas. Inhalation of high concentrations of ethanethiol can cause dizziness, headache, nausea, vomiting, and unconsciousness.

Ethaverine Hydrochloride *(rINNM)*

Éthavérine, Chlorhydrate d'; Ethaverini Hydrochloridum; Hidrocloruro de etaverina. 6,7-Diethoxy-1-(3,4-diethoxybenzyl)isoquinoline hydrochloride.

Этаверина Гидрохлорид

$C_{24}H_{29}NO_4,HCl$ = 432.0.
CAS — 486-47-5 (ethaverine); 985-13-7 (ethaverine hydrochloride).



(ethaverine)

Profile

Ethaverine is the tetraethoxy analogue of papaverine (p.2191) and has been used as the hydrochloride as an antispasmodic in respiratory-tract, biliary, gastrointestinal, and genito-urinary disorders. It has also been used in migraine, vascular disorders and as an antiarrhythmic.

Ethaverine sulfamate has also been used.

Preparations

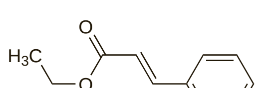
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Asthma Efeum; Gastripan; Oddispasmol; ***Braz.:*** Eufermen†; ***Thai.:*** Elzym†.

Ethyl Cinnamate

Cinamato de etilo. Ethyl (*E*)-3-phenylprop-2-enoate.

$C_{11}H_{12}O_2$ = 176.2.
CAS — 103-36-6.



Pharmacopoeias. In *Br.*

BP 2008 (Ethyl Cinnamate). A clear, colourless or almost colourless liquid with a fruity, balsamic odour. Practically insoluble in water; miscible with most organic solvents.

Profile

Ethyl cinnamate is used as a flavour and perfume; it is an ingredient of Tolu-flavour Solution (BP 2008).

Preparations

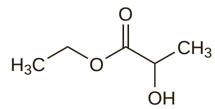
BP 2008: Tolu-flavour Solution.

Ethyl Lactate

Etilo, lactato de.

Этиллактат

$C_5H_{10}O_3$ = 118.1.
CAS — 97-64-3.



Profile

Ethyl lactate has been applied topically in the treatment of acne vulgaris. It is reported to lower the pH within the skin thereby exerting a bactericidal effect.

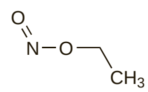
Ethyl lactate is also used in the flavouring of foods.

Ethyl Nitrite

Nitrous Acid Ethyl Ester; Nitrous Ether.

Этилнитрит

$C_2H_5NO_2$ = 75.07.
CAS — 109-95-5.



NOTE. Do not confuse with *O*-nitrosoethanol, a substance that has been referred to in the literature as 'ethyl nitrite gas'.

Profile

Ethyl nitrite has vasodilator effects similar to other volatile nitrites (see Amyl Nitrite, p.1437). Alcoholic solutions of ethyl nitrite (Ethyl Nitrite Spirit; Nitrous Ether Spirit; Sweet Nitre Spirit; Sp. Aether. Nitros.) have been used as a diaphoretic in the treatment of colds and fevers.

◊ Methaemoglobinaemia occurred in 2 infants given a folk remedy containing ethyl nitrite. Despite treatment with methylthionium chloride 1 infant died.[1]

1. Chilcote RR, *et al.* Sudden death in an infant from methemoglobinemia after administration of "sweet spirits of nitre". *Pediatrics* 1977; **59:** 280–2.

Preparations

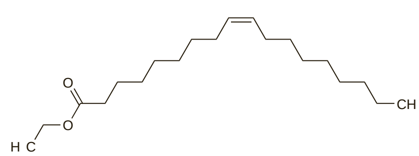
Proprietary Preparations (details are given in Part 3)

S.Afr.: Witdulsies.

Ethyl Oleate

Aethylis Oleas; Éthyle, oléate d'; Ethylis oleas; Ethyl-oleát; Etiloleát; Etiloleatas; Etyloleat; Etyylioleaatti; Oleato de etilo.

$C_{20}H_{38}O_2$ = 310.5.
CAS — 111-62-6.



Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Ethyl Oleate). A clear, pale yellow or colourless liquid. It consists of the ethyl esters of fatty acids, mainly oleic acid. It may contain a suitable antioxidant. Practically insoluble in water; miscible with alcohol, with dichloromethane, and with petroleum spirit (40° to 60°). Protect from light.

USNF 26 (Ethyl Oleate). It consists of esters of ethyl alcohol and high-molecular-weight fatty acids, principally oleic acid. A mobile, practically colourless liquid. Insoluble in water; miscible with alcohol, with vegetable oils, with liquid paraffin, and with most organic solvents. Store in airtight containers. Protect from light.

Incompatibility. Ethyl oleate dissolves some types of rubber and causes others to swell.

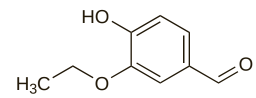
Profile

Ethyl oleate is used as an oily vehicle.

Ethyl Vanillin

Etilvanilina. 3-Ethoxy-4-hydroxybenzaldehyde.

$C_9H_{10}O_3$ = 166.2.
CAS — 121-32-4.



Pharmacopoeias. In *USNF.*

USNF 26 (Ethyl Vanillin). Fine, white or slightly yellowish crystals with a vanilla-like odour. M.p. is between 76° and 78°. Soluble 1 in 100 of water at 50° and 1 in 2 of alcohol; freely soluble in chloroform, in ether, and in solutions of alkali hydroxides. Its solutions are acid to litmus. Store in airtight containers. Protect from light.

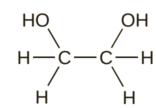
Profile

Ethyl vanillin is used as a flavour and in perfumery to impart the odour and taste of vanilla.

Ethylene Glycol

Ethylene Alcohol; Etilen Glikol; Etilenglicol; Glikol etylenowy; Glycol. Ethane-1,2-diol.

$C_2H_6O_2$ = 62.07.
CAS — 107-21-1.



Adverse Effects

Toxic effects arising from ingestion of ethylene glycol result from its major metabolites: aldehydes, glycolate, lactate, and oxalate. Clinical features may be divided into three stages depending on the time elapsed since ingestion. In the first 12 hours, the patient may show signs of drunkenness and experience nausea and vomiting. Convulsions and neurological defects may occur. From 12 to 24 hours, there may be tachycardia, mild hypertension, pulmonary oedema, and heart failure. Between 24 and 72 hours, patients with severe ethylene glycol poisoning may experience flank pain and renal involvement with associated decreased plasma concentrations of calcium and bicarbonate, metabolic acidosis, deposition of oxalate in tissues and kidney tubules, proteinuria, oxaluria, haematuria, and renal failure. There may be respiratory failure, cardiovascular collapse, and sometimes coma and death. The fatal dose is reported to be about 100 mL.

Skin irritation and penetration have been reported after topical application.

Diethylene glycol produces similar toxicity, except that there is no conversion to oxalate and there is greater nephrotoxicity. Poisoning has followed adulteration of medicinal products with diethylene glycol.

8. Hasbani MJ, *et al.* Encephalopathy and peripheral neuropathy following diethylene glycol ingestion. *Neurology* 2005; **64:** 1273–5.

Treatment of Adverse Effects

The stomach should be emptied by lavage if ingestion of ethylene glycol was within the preceding hour. Severe metabolic acidosis should be corrected. Hypocalcaemia may require correction with calcium gluconate in severe cases, although this is not usually done routinely because it may increase the formation of calcium oxalate crystals. Haemodialysis may be of value. Alcohol may be given by mouth or intravenously as it is a competitor of the metabolism of ethylene glycol. Alternatively fomepizole (p.1446), an alcohol-dehydrogenase inhibitor, may be used for the treatment of ethylene glycol poisoning.

7. Battistella M. Fomepizole as an antidote for ethylene glycol poisoning. *Ann Pharmacother* 2002; **36:** 1085–9.

Pharmacokinetics

Ethylene glycol is absorbed from the gastrointestinal tract and is metabolised, chiefly in the liver, by alcohol dehydrogenase. Its breakdown products account for its toxicity and include aldehydes, glycolate, lactate, and oxalate.

◊ References.

1. Sivilotti ML, *et al.* Toxicokinetics of ethylene glycol during fomepizole therapy: implications for management. *Ann Emerg Med* 2000; **36:** 114–25.

Uses

Ethylene glycol is commonly encountered in antifreeze solutions and has been used illicitly to sweeten some wines. Diethylene glycol has been used similarly.

Ethylenediamine

Edamine *(USAN, pINN)*; Edamina; Édamine; Edaminum; Ethylendiamin; Ethylendiaminum; Éthylènediamine; Ethylenediaminum; Etilén-diamin; Etilendiaminas; Etyleenidiamiini; Etylendiamin; Etylenodiamina.

Эдамин

$C_2H_8N_2$ = 60.10.

CAS — 107-15-3 (anhydrous ethylenediamine); 6780-13-8 (ethylenediamine monohydrate).

(ethylenediamine hydrate)

Pharmacopoeias. In *Eur.* (see p.vii), *Jpn*, and *US.*

Ph. Eur. 6.2 (Ethylenediamine). A clear, colourless or slightly yellow, hygroscopic liquid. On exposure to air, white fumes are evolved. On heating it evaporates completely. Miscible with water and with alcohol. Store in airtight containers. Protect from light.

USP 31 (Ethylenediamine). A clear, colourless or only slightly yellow liquid having an ammonia-like odour. It is strongly alkaline and may readily absorb carbon dioxide from the air to form a non-volatile carbonate. Miscible with water and with alcohol. Store in well-filled, airtight, glass containers.

Adverse Effects

Ethylenediamine is irritant to the skin and to mucous membranes. Severe exfoliative dermatitis has been reported after systemic use of preparations containing ethylenediamine. Hypersensitivity reactions are common. Concentrated solutions cause skin burns. Headache, dizziness, shortness of breath, nausea, and vomiting have also been reported after exposure to fumes. Ethylenediamine splashed onto the skin or eyes should be removed by flooding with water for a prolonged period.

Hypersensitivity. A review of allergy to ethylenediamine and aminophylline.[1]

1. Anonymous. Allergy to aminophylline. *Lancet* 1984; **ii :** 1192–3.

Precautions

Skin reactions may occur in patients given aminophylline after they have become sensitised to ethylenediamine. Cross-sensitivity with edetic acid and with some antihistamines has been reported.

Cross-sensitivity. It was reported that some topical corticosteroid creams, including *Tri-Adcortyl* in the UK,[1] and *Kenacomb*, *Halcicomb*, and *Viaderm* in Canada,[2] contained ethylenediamine and could cause unexpected cross-sensitivity reactions with piperazine[1] or aminophylline.[2]

1. Wright S, Harman RRM. Ethylenediamine and piperazine sensitivity. *BMJ* 1983; **287:** 463–4.
2. Hogan DJ. Excipients in topical corticosteroid preparations in Canada. *Can Med Assoc J* 1989; **141:** 1032.

Uses and Administration

Ethylenediamine or ethylenediamine hydrate forms a stable mixture with theophylline to produce aminophylline or aminophylline hydrate. Ethylenediamine is widely used in the chemical and pharmaceutical industries and as an ingredient of some topical creams.

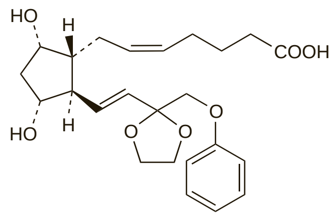
Etiproston Trometamol *(rINNM)*

Etiprostón trometamol; Etiproston Tromethamine; Étiprostone Trométamol; Etiprostonum Trometamolum. Trometamol salt of (*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(*E*)-2-[2-(phenoxymethyl)-1,3-dioxolan-2-yl]vinyl]cyclopentyl]-5-heptenoic acid.

Этипростон Трометамол

$C_{24}H_{32}O_7,C_4H_{11}NO_3$ = 553.6.

CAS — 59619-81-7 (etiproston).



(etiproston)

Profile

Etiproston trometamol is a synthetic analogue of dinoprost (prostaglandin F_2). It is used as a luteolytic in veterinary medicine.

Eucalyptus Leaf

Blahovičníkový list; Eucalypti folium; Eucalyptus, feuille d'; Eucalyptusblätter; Eukaliptų lapai; Eukaliptuszlevél; Eukalyptuksenlehti; Eukalyptusblad.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. (Eucalyptus Leaf). It consists of the whole or cut dried leaves of older branches of *Eucalyptus globulus*. The whole drug contains not less than 2% v/w of essential oil and the cut drug not less than 1.5% v/w of essential oil, both calculated with reference to the anhydrous drug. It has an aromatic odour of cineole. Protect from light.

Profile

Eucalyptus leaf has been used in oral preparations for coughs and associated respiratory-tract disorders. It is also used as a flavour. It is a source of eucalyptus oil (see below).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Pre Calent; ***Austria:*** Euka; ***Braz.:*** Broncol; Tussifen†; ***Canad.:*** Beech Nut Cough Drops†; ***Chile:*** Codetol PM; Paltomiel; Paltomiel Plus; Pulmosina; ***Fr.:*** Balsofumine; Balsofumine Mentholee; ***Ger.:*** Em-medical†; Hevertopect N†; ***Israel:*** Gingisan; ***Ital.:*** Altuss; Fosfoguaiacol; ***NZ:*** Otrivine Menthol; ***Rus.:*** Insti (Инсти); ***S.Afr.:*** Bolus Eucalypti Comp; ***Spain:*** Bronpul†; Diabesor†; Llantusil†; Natusor Broncopul†; Natusor Gripotul†; Pastillas Antisep Garg M; Vapores Pyt; ***UK:*** Calrub; Collins Elixir Decongesant Pasilles; No-Sor Nose Balm; PainEaze; Revitonil; Sinose; Sudarub; ***Venez.:*** Gamasol†; Mixagel†.

Eucalyptus Oil

Blahovičníková silice; Esencia de Eucalipto; Essence d'Eucalyptus Rectifiée; Eucalipto, aceite esencial de; Eucalypti aetheroleum; Eucalypti Etheroleum; Eucalyptus, huile essentielle d'; Eukaliptų eterinis aliejus; Eukaliptuszolaj; Eukalyptusolja; Eukalyptusöljy; Ökaliptüs Yağı; Olejek eukaliptusowy; Oleum Eucalypti.

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), and *Jpn.*

Ph. Eur. 6.2 (Eucalyptus Oil). A colourless or pale yellow liquid with a characteristic aromatic camphoraceous odour and a pungent camphoraceous taste. It is obtained by steam distillation and rectification from the fresh leaves or terminal branches of various species of *Eucalyptus* rich in cineole. The species mainly used are *E. globulus*, *E. polybractea*, and *E. smithii*. It contains not less than 70% w/w of cineole. Relative density 0.906 to 0.927. Soluble 1 in 5 of alcohol (70%). Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

Adverse Effects and Precautions

The symptoms of poisoning with eucalyptus oil include gastrointestinal symptoms such as epigastric burning, nausea and vomiting, and CNS depression, including coma. Cyanosis, ataxia, miosis, pulmonary damage, delirium, and convulsions may occur. Deaths have been reported.

Oily solutions of eucalyptus oil were formerly used in nasal preparations, but this use is now considered unsuitable as the vehicle inhibits ciliary movements and may cause lipoid pneumonia.

Uses and Administration

Eucalyptus oil has been taken orally for catarrh and coughs and is an ingredient of many preparations. It has been used as an inhalation often in combination with other volatile substances. Eucalyptus oil has also been applied as a rubefacient and is used as a flavour. It is also used in aromatherapy.

Preparations

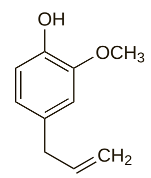
Eugenol

4-Allylguaiacol; Eugen.; Eugenic Acid; Eugénol; Eugenoli; Eugenolis; Eugenolum. 4-Allyl-2-methoxyphenol.

$C_{10}H_{12}O_2$ = 164.2.

CAS — 97-53-0.



Pharmacopoeias. In *Eur.* (see p.vii), *US*, and *Viet.*

Ph. Eur. 6.2 (Eugenol). A colourless or pale yellow liquid with a strong odour of clove. Practically insoluble in water and in glycerol; freely soluble in alcohol (70%); miscible with alcohol, with glacial acetic acid, with dichloromethane, and with fatty oils. Eugenol darkens in colour on exposure to air. Store in well-filled containers. Protect from light.

USP 31 (Eugenol). It is obtained from clove oil or from other sources. A colourless or pale yellow liquid having a strongly aromatic odour of clove. Upon exposure to air, it darkens and thickens. Slightly soluble in water; miscible with alcohol, with chloroform, with ether, and with fixed oils. Store in airtight containers. Protect from light.

Profile

Eugenol is a constituent of clove oil (p.2285) and some other essential oils. It is used in dentistry, often mixed with zinc oxide, as a temporary anodyne dental filling, and is an ingredient in oral hygiene preparations. Eugenol has been used as a flavour.

Eugenol is an irritant and sensitiser and can produce local anaesthesia. It is reported to inhibit prostaglandin synthesis.

For the pulmonary effects of eugenol inhalation from clove cigarettes, see Abuse, under Clove, p.2284.

Euphorbia

Euforbia; Pill-bearing Spurge; Snake Weed.

Pharmacopoeias. *Chin.* includes monographs for *Euphorbia humifusa* or *E. maculata* herb and *E. pekinensis* root.

Profile

Euphorbia, the aerial parts of *Euphorbia hirta* (*E. pilulifera*, *Chamaesyce hirta*) (Euphorbiaceae), has sedative and expectorant properties and is used in the treatment of asthma and other respiratory-tract disorders. It has also been used for intestinal amoebiasis.

Other *Euphorbia* spp. are used for a variety of disorders. The seeds and latex of *E. lathyrus* (caper spurge) have been used as a purgative but are too toxic for general use. Many species have been used as arrow poisons.

Preparations

Proprietary Preparations (details are given in Part 3)
India: Thankgod.

Multi-ingredient: ***Austral.:*** Asa Tones; Euphorbia Complex; Procold†; Sambucus Complex†; ***Belg.:*** Toularynx; ***Canad.:*** Sirop Cocillana Codeine; Sirop Cocillana Compose; ***Hong Kong:*** Cocillana Christo; Cocillana Compound; Mefedra-N†; ***UK:*** Antibron.

Euphrasia

Augentrost; Eufrasia; Euphraise; Eyebright.

Profile

Euphrasia, the aerial parts of various *Euphrasia* spp. including *E. rostkoviana* and *E. officinalis* (Scrophulariaceae), has been used topically for blepharitis, conjunctivitis, and other eye disorders. However, such use is not generally recommended. Euphrasia has also been used for nasal catarrh and sinusitis, and to prevent snoring.

Homoeopathy. Euphrasia has been used in homoeopathic medicines under the following names: Euphrasia officinalis; Euphrasia ex planta tota; Euph. of.

Preparations

Proprietary Preparations (details are given in Part 3)
UK: Snore Calm.

Multi-ingredient: ***Austral.:*** Bilberry Plus; Euphrasia Complex; Euphrasia Compound; Eye Health Herbal Plus Formula 4; Lifesystem Herbal Plus Formula 5 Eye Relief†; Sambucus Complex†; ***Ger.:*** Herba-Vision Augenbad; ***Ital.:*** Altacura Ipragocce; Eulux; Iridil; ***Malaysia:*** Eyebright Plus†; ***Switz.:*** Collypan; Oculosan; Tendro; ***UK:*** Se-Power; Vital Eyes.

Evening Primrose

King's Cureall; Onagre.

Profile

Evening primrose, the aerial parts of *Oenothera biennis* (Onagraceae) and related species of *Oenothera*, is reported to have sedative and astringent properties. It has been used in herbal preparations for respiratory and gastrointestinal disorders.

Evening primrose seed is the source of evening primrose oil (below), which is a source of essential fatty acids.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Ital.:*** Sclerovis H.

Evening Primrose Oil

Helokkiöljy; Nakvišų aliejus; Nattljusolja; Oenotherae oleum; Olej wiesiołkowy; Olej wiesiołkowy bezpośredniego tłoczenia (virgin evening primrose oil); Onagra, aceite de; Onagre, huile d'; Pupalkový olej.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Evening Primrose Oil, Refined; Oenotherae Oleum Raffinatum). The fatty oil obtained from the seeds of *Oenothera biennis* or *O. lamarkiana* by extraction and/or expression, and then refined. A suitable antoxidant may be added. A clear, light yellow or yellow liquid. Relative density about 0.923. Practically insoluble in water and in alcohol; miscible with petroleum spirit (b.p.: 40° to 60°). Store in well-filled, airtight containers under an inert gas. Protect from light.

Adverse Effects and Precautions

See Gamolenic Acid, p.2308.

Effects on the nervous system. Temporal lobe epilepsy was diagnosed after treatment with evening primrose oil in 3 patients who had previously been diagnosed as schizophrenic.[1] Tonic-clonic (grand mal) seizures occurred in 2 additional schizophrenic patients during treatment with evening primrose oil.[2] All of these patients had received or were taking phenothiazine antipsychotics.

1. Vaddadi KS. The use of gamma-linolenic acid and linoleic acid to differentiate between temporal lobe epilepsy and schizophrenia. *Prostaglandins Med* 1981; **6:** 375–9.
2. Holman CP, Bell AFJ. A trial of evening primrose oil in the treatment of chronic schizophrenia. *J Orthomol Psychiatry* 1983; **12:** 302–4.

Uses and Administration

Evening primrose oil is a source of linoleic and gamolenic acid which are essential fatty acids of the omega-6 series that act as prostaglandin precursors (see p.2308). Evening primrose oil has been given orally for the symptomatic relief of atopic eczema in usual doses of up to 3 grams twice daily; it is also used topically as a cream for the relief of dry or inflamed skin. Evening primrose oil has also been given orally for mastalgia. Evening primrose oil has been studied in a variety of other disorders including multiple sclerosis, rheumatoid arthritis, and the premenstrual syndrome. Mixtures of essential fatty acids (including EF-4, EF-12, and EF-27) derived from evening primrose oil and other oils have also been investigated in various disorders, including diabetic neuropathy, restenosis after angioplasty, and skin damage after radiotherapy.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Felypressin). A synthetic nonapeptide available as an acetate. A white or almost white powder or flakes. Freely soluble in water; practically insoluble in alcohol and in acetone. It dissolves in dilute solutions of alkali hydroxides. Store in airtight containers at a temperature of 2° to 8°. Protect from light.

Profile

Felypressin is a synthetic analogue of vasopressin (p.2411) with similar actions. Its antidiuretic effects are less than those of vasopressin. It is used as a vasoconstrictor in local anaesthetic injections for dental use when sympathomimetics should be avoided. It is also an ingredient of preparations that have been used in the treatment of pain and inflammation of the mouth.

Preparations

Proprietary Preparations (details are given in Part 3)

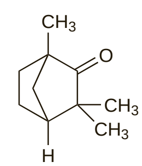
Used as an adjunct in: ***Austral.:*** Citanest Dental; ***Braz.:*** Citanest; Citocaina; ***Denm.:*** Citanest Octapressin; ***Fin.:*** Citanest Octapressin; ***Ger.:*** Xylonest; ***Ital.:*** Citanest con Octapressin; ***Mex.:*** Citanest Octapresin†; Pristesin F; ***Neth.:*** Citanest Octapressine; ***Norw.:*** Citanest Octapressin; ***NZ:*** Citanest with Octapressin†; ***Spain:*** Citanest Octapressin; ***Swed.:*** Citanest Octapressin; ***Switz.:*** Citanest Octapressin; ***Turk.:*** Citanest Octapressin; ***UK:*** Citanest with Octapressin.

Fenchone

Fenchon. 1,3,3-Trimethylbicyclo[2.2.1]heptan-2-one.

Фенхон

$C_{10}H_{16}O$; = 152.2.
CAS — 4695-62-9 ((+)-fenchone); 7787-20-4 ((−)-fenchone); 1195-79-5 ((±)-fenchone).



Profile

Fenchone is a constituent of several essential oils. It has been used in preparations in the treatment of biliary and urinary-tract disorders. It is reported to have counter-irritant properties. Fenchone is also used as a flavour and in perfumery.

Preparations

Proprietary Preparations (details are given in Part 3)

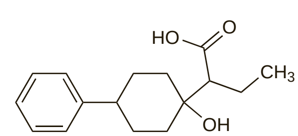
Multi-ingredient: ***Austria:*** Rowatinex; ***Chile:*** Rowatinex; ***Cz.:*** Rowatinex; ***Ger.:*** Rowatinex; ***Hong Kong:*** Neo-Rowatinex; Rowatinex; ***Hung.:*** Rowatinex; ***Irl.:*** Rowatinex; ***Israel:*** Rowatinex; ***Malaysia:*** Rowatinex; ***Philipp.:*** Rowatinex; ***Pol.:*** Rowatinex; ***Spain:*** Rowanefrin; ***Thai.:*** Rowatinex; ***Venez.:*** Rowatinex.

Fencibutirol *(USAN, rINN)*

Fencibutirolum; Mg-4833. 2-(1-Hydroxy-4-phenylcyclohexyl)butyric acid.

Фенцибутирол

$C_{16}H_{22}O_3$ = 262.3.
CAS — 5977-10-6.



Profile

Fencibutirol is a choleretic that has been used in the treatment of constipation and biliary-tract disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Ital.:*** Magisbile†.

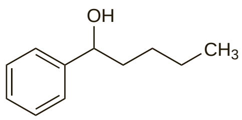
Fenipentol *(rINN)*

Fénipentol; Fenipentolum. 1-Phenylpentan-1-ol; α-Butylbenzyl alcohol.

Фенипентол

$C_{11}H_{16}O$ = 164.2.

CAS — 583-03-9.



Profile

Fenipentol is a choleretic that has been given orally for the treatment of hepatic and biliary-tract disorders in doses of 100 to 200 mg three times daily. The hemisuccinate and sodium hemisuccinate have also been used.

Preparations

Proprietary Preparations (details are given in Part 3)

Cz.: Febichol; ***Ger.:*** Febichol; ***Ital.:*** Pentabil†.

Multi-ingredient: ***Chile:*** Digezin†; ***Ital.:*** Critichol; ***Spain:*** Menabil Complex†; ***Venez.:*** Cholipin.

Fennel

Édesköménytermés (bitter fennel); Fänkål, bitter (bitter fennel); Fänkål, söt (sweet fennel); Fenchel; Fenkoli, karvas (bitter fennel); Fenkoli, makea (sweet fennel); Fennel Fruit; Fennel Seed; Fenouil; Fenouil Amer; Fenouil amer, fruit de (bitter fennel); Fenouil doux, fruit de (sweet fennel); Foeniculi amari fructus (bitter fennel); Foeniculi dulcis fructus (sweet fennel); Foeniculum; Fruto de Hinojo; Funcho; Hinojo; Kartieji pankolių vaisiai (bitter fennel); Kerti édesköménytermés (sweet fennel); Owoc kopru włoskiego (bitter fennel); Plod fenyklu obecného pravého (bitter fennel); Plod fenyklu obecného sladkého (sweet fennel); Saldieji pankolių vaisiai (sweet fennel).

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), and *Jpn.*

Ph. Eur. 6.2 (Fennel, Bitter; Foeniculi Amari Fructus). It consists of the dry, cremocarps and mericarps of *Foeniculum vulgare*, subsp. *vulgare*, var. *vulgare*. It contains not less than 4.0% v/w of essential oil, calculated with reference to the anhydrous drug. The oil contains not less than 60.0% of anethole and not less than 15.0% of fenchone. Bitter fennel is greenish-brown, brown, or green. Protect from light and moisture.

Ph. Eur. 6.2 (Fennel, Sweet; Foeniculi Dulcis Fructus). It consists of the dry, cremocarps and mericarps of *Foeniculum vulgare*, subsp. *vulgare*, var. *dulce*. It contains not less than 2.0% v/w of essential oil, calculated with reference to the anhydrous drug. The oil contains not less than 80.0% of anethole. Sweet fennel is pale green or pale yellowish-brown. Protect from light and moisture.

Profile

Fennel is the source of fennel oil (below). It is used as a flavour and carminative, although the efficacy of such traditional remedies in infant colic is considered dubious (see Gastrointestinal Spasm, p.1696). It is also used in herbal remedies for respiratory-tract disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Cz.: Fenyklovy Caj; Gallentee†; ***Rus.:*** Plantex (Плантекс).

Multi-ingredient: ***Arg.:*** Arceligasol; ***Austral.:*** Bupleurum Compound; Crampeze Stomach Cramps; Digestive Aid; ***Austria:*** Brady's-Magentropfen; Euka; Illings Bozner Maycur-Tee†; Laxalpin; Mag Kottas Krauterexpress Abfuhrtee; Mag Kottas May-Cur-Tee; Nesthakchen; Planta Lax; Species Carvi comp†; ***Canad.:*** Herbal Laxative; Herbal Laxative plus Yogurt; Thunas Laxative†; ***Chile:*** Instalax; Reduc-Te; ***Cz.:*** Blahungstee N†; Bronchialtee N†; Cajova Smes pri Nachlazeni; Carminativum Babynos†; Detska Cajova Smes; Detsky Caj s Hermankem; Diabetan; Erkaltungstee†; Nervova Cajova Smes; Projimava; Pulmoran; Reduktan; Species Pectorales Planta; Stoffwechseltee N†; Stomaran; Ungolen†; Zaludecni Cajova Smes; ***Fr.:*** Benetransit; Bolcitol; Mediflor Tisane Contre la Constipation Passagere No 7; Mediflor Tisane Digestive No 3; Mediflor Tisane No 4 Diuretique; ***Ger.:*** Carminativum Babynos†; Carminativum-Hetterich; Em-eukal Husten- und Brusttee†; Em-medical†; Floradix Multipretten N; Gallexier; Gastricholan-L; Gastrol S†; Kneipp Husten- und Bronchial-Tee; Leber-Galle-Tropfen 83†; Lomatol†; Majocarmin-Tee; Pascopankreat novo†; Presselin Blahungs K 4 N†; Presselin Dyspeptikum†; Presselin Stoffwechsel-Tee Hapeka 225 N†; Ramend Krauter†; Stovalid N†; ***Israel:*** Jungborn; ***Ital.:*** Actenacol; Altea (Specie Composta)†; Anice (Specie Composta)†; Cadifen; Cadimint; Colimil; Dicalmir; Epagest†; Evamilk; Relaxcol; Senna-Specie Composta†; Timo (Specie Composta)†; ***Jpn:*** The Guard Seichojo; ***Malaysia:*** Eyebright Plus†; ***Pol.:*** Amarosal; Diges-Tonic; Rhelax; Salviasept; Sirupus Pini Compositus; Sirupus Tussipini; Sirupus Tussipini D; ***Rus.:*** Insti (Инсти); ***Spain:*** Crislaxo; Himelan†; Natusor Aerofane†; Natusor Malvasen†; Senalsor†; ***Switz.:*** Kernosan Elixir; Kernosan Heidelberger Poudre; Tisane favorisant l'allaitement; Tisane laxative; Tisane pectorale et antitussive; Tisane pour nourissons et enfants; ***UK:*** Cleansing Herbs; Herbal Indigestion Naturtabs; Indigestion and Flatulence; Lion Cleansing Herbs; Lustys Herbalene; Out-of-Sorts; Revitonil; Senokot Dual Relief; Sure-Lax (Herbal).

Fennel Oil

Aetheroleum Foeniculi; Bitterfänkålsolja (bitter-fennel fruit oil); Esencia de Hinojo; Essência de Funcho; Fenouil amer (fruit de), huile essentielle de (bitter-fennel fruit oil); Foeniculi amari fructus aetheroleum (bitter-fennel fruit oil); Hinojo, aceite esencial; Karčiųjų pankolių vaisių eterinis aliejus (bitter-fennel fruit oil); Karvasfenkoliöljy (bitter-fennel fruit oil); Olejek kopru włoskiego (bitter-fennel fruit oil); Oleum Foeniculi; Rezene Yağı; Silice fenyklu hořkého (bitter-fennel fruit oil).

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.* Also in *USNF.*

Ph. Eur. 6.2 (Bitter-Fennel Fruit Oil; Foeniculi Amari Fructus Aetheroleum). The essential oil obtained by steam distillation from the ripe fruits of *Foeniculum vulgare*, subsp. *vulgare*, var. *vulgare*. It contains 12.0 to 25.0% fenchone and 55.0 to 75.0% anethole. A clear, colourless or pale yellow liquid with a characteristic odour. Store in well-filled, airtight containers at a temperature not exceeding 25°. Protect from light.

USNF 26 (Fennel Oil). The volatile oil distilled with steam from the dried, ripe fruit of *Foeniculum vulgare* (Apiaceae). Congealing temperature not lower than 3°. Soluble 1 in 1 of alcohol (90%). If solid matter has separated, carefully warm the oil until it is completely liquefied, and mix before using. Store in airtight containers.

Profile

Fennel oil is used as an aromatic flavour and carminative (but see the comment under Fennel, above); the German expert committee for herbal drugs and preparations (Commission E) considers that the use of fennel oil in infants and toddlers is contra-indicated. It is also used in herbal remedies for respiratory-tract disorders and in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

Fenoverine *(rINN)*

Fenoverina; Fénovérine; Fenoverinum. 10-[(4-Piperonyl-1-piperazinyl)acetyl]phenothiazine.

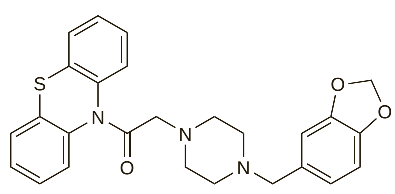
Феноверин

$C_{26}H_{25}N_3O_3S$ = 459.6.

CAS — 37561-27-6.

ATC — A03AX05.

ATC Vet — QA03AX05.



Profile

Fenoverine has been used as an antispasmodic but has been withdrawn in some countries after reports of rhabdomyolysis.

Adverse effects. Reports of rhabdomyolysis associated with fenoverine,[1-3] including a fatality.[1] A genetic predisposition has been suggested.[2]

1. Chariot P, *et al.* Fenoverine-induced rhabdomyolysis. *Hum Exp Toxicol* 1995; **14:** 654–6.
2. Jouglard J, *et al.* Research into individual predisposition to develop acute rhabdomyolysis attributed to fenoverine. *Hum Exp Toxicol* 1996; **15:** 815–20.

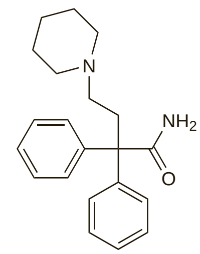
Fenpipramide *(BAN, rINN)*

Fenpipramid; Fenpipramida; Fenpipramidi; Fenpipramidum. 2,2-Diphenyl-4-piperidinobutyramide.

Фенпипрамид

$C_{21}H_{26}N_2O$ = 322.4.

CAS — 77-01-0.



Fenpipramide Hydrochloride *(BANM, rINNM)*

Fenpipramide, Chlorhydrate de; Fenpipramidi Hydrochloridum; Hidrocloruro de fenpipramida.

Фенпипрамида Гидрохлорид

$C_{21}H_{26}N_2O,HCl$ = 358.9.

CAS — 14007-53-5.

Fenpiverinium Bromide *(rINN)*

Bromuro de fenpiverinio; Fenpipramide Methobromide; Fenpipramide Methylbromide; Fenpiverinii Bromidum; Fenpivérinium, Bromure de. 1-(3-Carbamoyl-3,3-diphenylpropyl)-1-methylpiperidinium bromide; 2,2-Diphenyl-4-piperidinobutyramide methyl bromide.

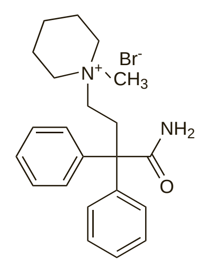
Фенпиверииния Бромид

$C_{22}H_{29}BrN_2O$ = 417.4.

CAS — 125-60-0.

ATC — A03AB21.

ATC Vet — QA03AB21.



Profile

Fenpipramide (as the hydrochloride) and its methobromide, fenpiverinium bromide have been used as antispasmodics. Fenpipramide hydrochloride is also used for its antimuscarinic actions in veterinary medicine.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Cz.:*** Algifen; Analgin; Spasmopan; ***Pol.:*** Spasmalgon; ***Rus.:*** Baralgetas (Баралгетас)†; Maxigan (Максиган); Nebalgan (Небалган); Novigan (Новиган); Revalgin (Ревалгин); Spasgan (Спазган); Spasmalgon (Спазмалгон); Spasmalin (Спазмалин); ***S.Afr.:*** Baralgan†; ***Thai.:*** Kanegan; ***Venez.:*** Flemibar.

Fenugreek

Bockhornsfrö; Bockshornsame; Faenum-Graecum; Fenogreco; Fenugrec; Görögszénamag; Greek hay; Ožragių sėklos; Sarviapilansiemen; Semen Foenugraeci; Semen Trigonellae; Semeno pískavice řeckého sena; Trigonella Foenugraeci Semen; Trigonellae foenugraeci semen.

Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii).

Ph. Eur. 6.2 (Fenugreek). The dried ripe seeds of *Trigonella foenum-graecum*. It has a strong characteristic odour. Protect from light.

Profile

Fenugreek has been used as an appetite stimulant and as an ingredient in preparations for respiratory disorders. It also has emollient properties.

Adverse effects. Loss of consciousness occurred in a 5-week-old infant after ingestion of a herbal tea containing fenugreek.[1] On recovery the infant and his urine had an aroma characteristic of that found in 'maple syrup urine disease', an inborn condition involving defective metabolism of branched-chain amino acids.

Further investigation revealed that the infant did not have the disease; the aroma was due to the presence of sotolone in the fenugreek seeds used to prepare the tea.

1. Sewell AC, *et al.* False diagnosis of maple syrup urine disease owing to ingestion of herbal tea. *N Engl J Med* 1999; **341:** 769.

Preparations

Multi-ingredient: ***Austral.:*** Bilberry Plus; Garlic and Horseradish + C Complex; Panax Complex†; ***Fr.:*** Phytheol; ***India:*** Happy'tizer; ***Indon.:*** Provigor; ***Malaysia:*** Horseradish Plus†.

Ferric Chloride

Chlorid železitý hexahydrát; Chlorure Ferrique; Ferr. Perchlor.; Ferri chloridum hexahydricum; Férrico, cloruro; Ferrikloridhexahydrat; Ferrikloridiheksahydraatti; Ferrique (chlorure) hexahydraté; Ferrum Sesquichloratum; Geležies(III) chloridas heksahidratas; Iron Perchloride; Iron Sesquichloride; Iron Trichloride; Vas(III)-klorid-hexahidrát; Żelaza(III) chlorek.

$FeCl_3,6H_2O$ = 270.3.

CAS — 7705-08-0 (anhydrous ferric chloride); 10025-77-1 (ferric chloride hexahydrate).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Ferric Chloride Hexahydrate). A very hygroscopic, crystalline mass or orange-yellow to brownish-yellow crystals. Very soluble in water and in alcohol; freely soluble in glycerol. Store in airtight containers. Protect from light.

Profile

Ferric chloride has the general properties of iron salts (p.1949) but is exceptionally astringent. It has been used mainly by local application for its styptic and astringent properties. Local application of ferric chloride or other iron salts may cause permanent discoloration of the skin.

Preparations

Proprietary Preparations (details are given in Part 3)

Ital.: Cotone Emostatico; ***Rus.:*** Hemofer (Гемофер); ***S.Afr.:*** Staaldruppels.

Multi-ingredient: ***Belg.:*** Ouate Hemostatique; ***UK:*** Glykola.

Fibronectins

Fibronectina.

Фибронектины

Profile

Fibronectins are high molecular weight endogenous adhesive glycoproteins found in plasma and in the extracellular matrix. Plasma fibronectin was originally known as cold-insoluble globulin. Fibronectins are principally involved in cellular attachment and migration in normal physiological processes as well as in various malignant diseases. They have an important role in the function of the extracellular matrix, and in morphogenesis and tissue remodelling. They also play a part in aggregation of platelets, and are used in combinations with other blood products in wound-sealant preparations. Manipulation of the activity of fibronectins (for example with fibronectin inhibitors or fibronectin fragments) is being investigated in the treatment of connective tissue diseases, malignancies, and wound healing. Fibronectin itself has potential use as a research tool for the study of cell adhesion and migration processes.

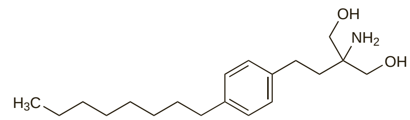
Fingolimod *(rINN)*

Fingolimodum; FTY-720 (fingolimod hydrochloride). 2-Amino-2-[2-(4-octylphenyl)ethyl]propane-1,3-diol.

Финголимод

$C_{19}H_{33}NO_2$ = 307.5.

CAS — 162359-55-9 (fingolimod); 162359-56-0 (fingolimod hydrochloride).



NOTE. Fingolimod hydrochloride is *USAN*.

Profile

Fingolimod is an immunomodulator under investigation for multiple sclerosis and prophylaxis of acute rejection in kidney transplantation. Fingolimod is a prodrug, which after phosphorylation, acts as a sphingosine-1-phosphate receptor agonist that binds to the surface of lymphocytes and redirects them from the bloodstream and graft sites to the lymph nodes.

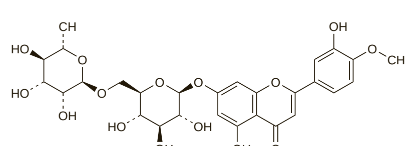
Диосмин

$C_{28}H_{32}O_{15}$ = 608.5.

CAS — 520-27-4.

ATC — C05CA03.

ATC Vet — QC05CA03.



Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Diosmin). A greyish-yellow or light yellow hygroscopic powder. Practically insoluble in water and in alcohol; soluble in dimethyl sulfoxide. It dissolves in dilute solutions of alkali hydroxides. Store in airtight containers.

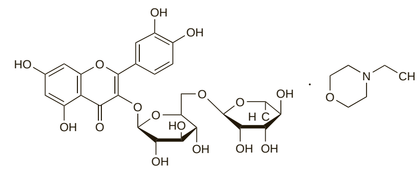
Ethoxazorutoside *(rINN)*

Aethoxazorutin; Aethoxazorutoside; Ethoxazorutin; Éthoxazorutoside; Ethoxazorutosidum; Etoxazorutósido; Oxarutinum. 2-Morpholinoethylrutin.

Этоксазорутозид

$C_{33}H_{41}NO_{17}$ = 723.7.

CAS — 30851-76-4.



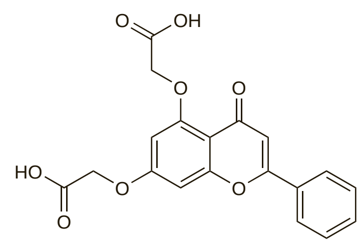
Flavodate Sodium *(rINNM)*

Flavodate de Sodium; Flavodate Disodium; Flavodato sódico; Natrii Flavodas. Disodium (4-oxo-2-phenyl-4*H*-chromene-5,7-diyldioxy)diacetate.

Натрий Флаводовая

$C_{19}H_{12}Na_2O_8$ = 414.3.

CAS — 37470-13-6 (flavodic acid); 13358-62-8 (flavodate disodium).



(flavodic acid)

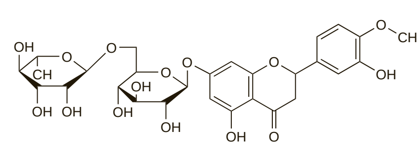
Hesperidin

Hesperidiini; Hesperidina; Hesperidinum; Hesperydyna. 5-Hydroxy-2-(3-hydroxy-4-methoxyphenyl)-4-oxo-4*H*-chromen-7-yl rutinoside.

Гесперидин

$C_{28}H_{34}O_{15}$ = 610.6.

CAS — 520-26-3 (hesperidin); 24292-52-2 (hesperidin methyl chalcone).



Description. Hesperidin is a flavonoid isolated from the rind of certain citrus fruits.

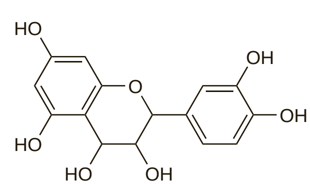
Leucocianidol *(rINN)*

Leucocianidolum; Leucocyanidin; Leucocyanidol. 2-(3,4-Dihydroxyphenyl)chroman-3,4,5,7-tetrol.

Лейкоцианидол

$C_{15}H_{14}O_7$ = 306.3.

CAS — 480-17-1.

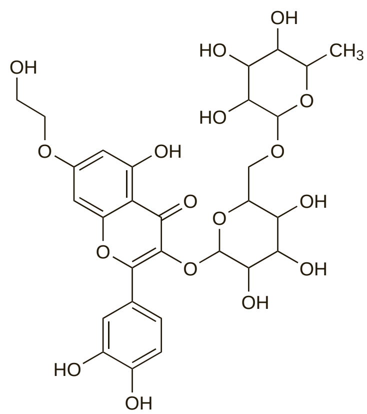


Monoxerutin *(rINN)*

Monohydroxyethylrutosides; Monokserutiini; Monoxerutina; Monoxérutine; Monoxerutinum. 7-(β-Hydroxyethyl)rutoside.

Моноксерутин

$C_{29}H_{34}O_{17}$ = 654.6.
CAS — 23869-24-1.
ATC — C05CA02.
ATC Vet — QC05CA02.



Oxerutins *(BAN)*

Hydroxyethylrutosides; Oxerutinas.

Оксерутины

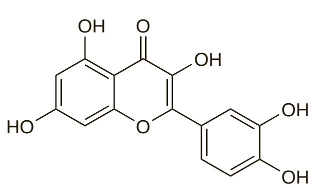
Description. Oxerutins consist of a mixture of 5 different *O*-(β-hydroxyethyl)rutosides, not less than 45% of which is troxerutin (trihydroxyethylrutoside, below), but which also includes monohydroxyethylrutoside, dihydroxyethylrutoside, and tetrahydroxyethylrutoside.

Quercetin

3,3′,4′,5,7-Pentahydroxyflavone; Quercetina. 2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-4*H*-1-benzopyran-4-one.

Кверцетин

$C_{15}H_{10}O_7$ = 302.2.
CAS — 117-39-5.

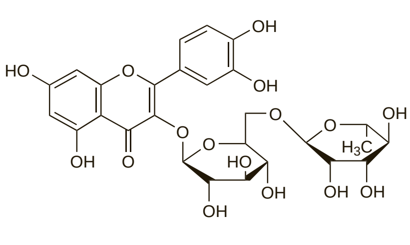


Rutoside *(BAN, rINN)*

Rutin; Rutosid; Rutoside trihydraté; Rutosidi; Rutosiditrihydraatti; Rutósido; Rutosidtrihydrat; Rutosidum; Rutosidum trihydricum; Rutozidas trihidratas; Rutozid-trihidrát; Rutozyd; Rutyna. 2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-4-oxo-4*H*-chromen-3-yl rutinoside trihydrate; 2-(3,4-Dihydroxyphenyl)-5,7-dihydroxy-4-oxo-4*H*-chromen-3-yl 6-*O*-(α-L-rhamnosyl)-β-D-glucoside.

Рутозид

$C_{27}H_{30}O_{16},3H_2O$ = 664.6.
CAS — 153-18-4 (anhydrous rutoside).
ATC — C05CA01.
ATC Vet — QC05CA01.



Description. Rutoside is a flavonoid obtained from buckwheat, *Fagopyrum esculentum* (Polygonaceae), or from other sources which include the flower buds of the Japanese pagoda-tree, *Sophora japonica*, and the leaves of several species of *Eucalyptus*.

Pharmacopoeias. In *Eur.* (see p.vii) and *Viet.*

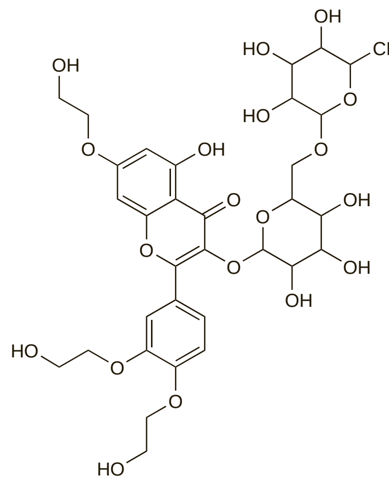
Ph. Eur. 6.2 (Rutoside Trihydrate). A yellow or greenish-yellow crystalline powder. Practically insoluble in water; sparingly soluble in dehydrated alcohol; practically insoluble in dichloromethane; soluble in methyl alcohol. It dissolves in solutions of alkali hydroxides. Protect from light.

Troxerutin *(BAN, rINN)*

THR; Trihydroxyethylrutoside; Trioxyethylrutin; Trokserutiini; Trokserutyna; Troxerutina; Troxérutine; Troxerutinum. 3′,4′,7-Tris[*O*-(2-hydroxyethyl)]rutin; 5-Hydroxy-7-(2-hydroxyethoxy)-2-[3,4-bis(2-hydroxyethoxy)phenyl]-4-oxo-4*H*-chromen-3-yl rutinoside.

Троксерутин

$C_{33}H_{42}O_{19}$ = 742.7.
CAS — 7085-55-4.
ATC — C05CA04.
ATC Vet — QC05CA04.



Description. Troxerutin is the principal component of oxerutins, above.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Troxerutin). A yellowish-green, hygroscopic, crystalline powder. Freely soluble in water; slightly soluble in alcohol; practically insoluble in dichloromethane. Store in airtight containers. Protect from light.

Profile

Flavonoids are naturally occurring antoxidants that are widely distributed in plants. Preparations containing natural or semisynthetic flavonoids are thought to improve capillary function by reducing abnormal leakage. They have been given to relieve capillary impairment and venous insufficiency of the lower limbs, and for haemorrhoids.

It has been suggested that flavonoids present in some foods, such as fruit, vegetables, tea, and red wine may protect against the development of atherosclerosis (p.1159).

Preparations

Proprietary Preparations (details are given in Part 3)

Arg.: Flebon; Flebotropin; Flerox†; Jatamansin†; Rutilina; Terbenol; Venoruton; Venosmil; ***Austral.:*** Paroven; ***Austria:*** Venoruton; ***Belg.:*** Docrutosi; Veinamitol; Ven-Detrex; Venoruton; ***Braz.:*** Daflon; Flavonid; Venoruton; ***Chile:*** Flebopex; Insuven; Venoruton; ***Cz.:*** Cilkanol; Venoruton; ***Denm.:*** Venoruton; ***Fr.:*** Daflon; Diamoril†; Dio; Diosmil†; Diovenor; Endium; Flavan; Flebosmil; Intercyton; Mediveine; Preparation H Veinotonic; Relvene; Rheoflux; Titanoral; Veinamitol; Veineva; Venirene; ***Ger.:*** Drisi-Ven†; Posorutin; Rutinion; Tovene; Troxeven; Vastribil†; Veno SL; Venoruton; Venotrulan Trox; ***Gr.:*** Radiavit; Rioven†; Venoruton; ***Hong Kong:*** Venoruton†; ***Hung.:*** Veinamitol†; Venoruton; ***India:*** Venusmin; ***Indon.:*** Ardium; Venaron; ***Israel:*** Veinamitol†; Venoruton; Vridol†; ***Ital.:*** Alven; Arvenum; Diosven; Doven; Pericel; Venolen; Venoruton; Venosmine; ***Mex.:*** Sies; Teboven; ***Neth.:*** Venoruton; ***NZ:*** Paroven; ***Philipp.:*** Varemoid; Venoruton; ***Pol.:*** Otrex; Phlebodia; Posorutin; Rutinoven; Rutoven; Troxeratio; Venolan; Venoruton; Venotrex; ***Port.:*** Arvenum; Hepacalmina; Muralion; Venex; Veno V; Venoruton; Venosmil; Veroven; ***Rus.:*** Phlebodia (Флебодиа); Troxevazin (Троксевазин); Venoruton (Венорутон); ***S.Afr.:*** Paroven; ***Spain:*** Esberiven; Pentovena†; Venolep; Venoruton; Venosmil; ***Switz.:*** Hemerven; Neorutin†; Pur-Rutin; Venoruton; Venutabs; ***Thai.:*** Flavon; Heteroid; Venoruton; ***Turk.:*** Daflon; Venoruton; ***UK:*** Paroven; ***USA:*** Citro-Flav; Limbrel; ***Venez.:*** Diovenor; Flavol; Hyflon; Verutil.

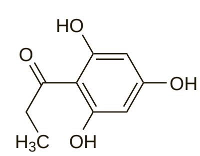
Multi-ingredient: ***Arg.:*** Accesum; Ajomast Circulatorio†; CVP B1 B6 B12†; CVP Duo; CVP Flebo; CVP Forte; Cyclo 3; Daflon; Dipemina; Diroseal; Epiteliol-C; Esberiven; Escina Forte; Escina Omega; Esculeol P; Exail; Fiblast; Flebitol; Flebotropin†; GB 100; HDG; Kacerutin; Microsuy; Mimixin; Phlogenzym†; Terbenol Duo; Troxeven†; Tubarine; Ulcevarin†; Varisedan; Vefluxan†; Venart; Venidium; Veraldid; Vitamina C-Complex; VNS 45; ***Austral.:*** B-Complex Threshold; Beta A-C; Bio C; Bio-C Complex; Bioglan Cirflo†; Bioglan Mega C; Bioglan Super Cal C; Bioglan The Blue One; Bioglan Zellulean with Escin; Bioglan Zn-A-C; C Supa + Bioflavonoids†; Cold & Flu Tablets Non Drowsy; Devils Claw Plus; Extralife Leg-Care; Eye Health Herbal Plus Formula 4; Flavonoid Complex; Flavons; For Peripheral Circulation Herbal Plus Formula 5; Gentle C with Bioflavonoids†; Lifesystem Herbal Formula 6 For Peripheral Circulation†; Lifesystem Herbal Plus Formula 5 Eye Relief†; Macro C†; Proflo†; Rubus Complex†; Super Cal-C Bio; Sustained Release C; ***Austria:*** Calcipot C; Cebion plus Rutin; Daflon; Helopyrin; Iroviton Multivitamin; Phlebodril; Phlogenzym; Ruticalzon; Rutiscorbin†; Rutiviscal; Rutozym; Sklerovitol; Tetesept; Traumazym; Trimedil; Venotop; Vit-C-Lutsch; Waldheim Influvidon; Wobenzym; ***Belg.:*** Daflon; Mictasol-P; ***Braz.:*** Castanha de India Composta†; Dactil OB; Daflon 500; Diosmin; Flebotrat†; Gingilone; Gripen; Hemodotti; Hemorroidex†; Manolio†; Mirorroidin†; Novarrutina; Panvitrop; Trimedal; Varicoss; Varizol†; Venaflon; Venalot; Venocur Triplex; Venovaz; ***Canad.:*** Ultra Quercitin; ***Chile:*** Daflon 500; Dipemina; Diroseal; Duo-CVP; Hemoplex†; Phyto Corrective Gel; Primacy Phyto +†; Venartel; Vesnidan; ***Cz.:*** Anavenol; Ascorutin; Cyclo 3 Fort; Detralex; Ginkor Fort; Phlogenzym; Wobenzym; ***Denm.:*** Capiven; ***Fr.:*** Avene Antirougeurs; Bicirkan; Cemaflavone; Cirkan; Cyclo 3 Fort; Diroseal; Esberiven Fort; Gel a l'Acetotartrate d'Alumine Defresne†; Ginkor; Ginkor Fort; Ophtadil†; Rheobral; Vascocitrol; Veliten; Venyl†; Vivene†; ***Ger.:*** Antihypertonicum S; Calcium-Rutinion†; Cycloven Forte N; Emocrat forte†; Enzym-Wied†; Essaven N†; Essaven ultra†; Eukalisan N; Fagorutin Buchweizen; Fagorutin Rosskastanien-Balsam N; Intradermi; Lindigoa S†; Movicard; Perivar†; Phlebodril; Phlogenzym; Posti N†; Ruticalzon VC†; Tornix; Vaso-E-Bion; Venalot; Venalot N†; Veno-Tebonin N†; Vitosal†; Wobenzym N; ***Gr.:*** Abanifan; Antican; Bioflevin; Cidoston; Cyclo 3 Forte; Daflon; Diosper; Dispedrol; Flavon†; Flevion; Flevostol; Gamophen; Mecaton; Noxarel; Oflazet; Pelethrocin; Roxydral; Smudal; Venosman†; ***Hong Kong:*** Daflon; Ginkor Fort; Hemo Rid; Poly C†; Quali-Flon; ***Hung.:*** Detralex; Ginkor Fort; Phlogenzym; Rutascorbin; ***India:*** Cadisper C; CKP; CVP; Gynae-CVP; Kalpastic; Styptocid; Styptocip†; ***Indon.:*** Ambeven Plus; Ciflon; Papaven; Vedium; ***Israel:*** Opti-safe; ***Ital.:*** Angioton; Capill Venogel; Daflon 500; Dermoangiopan†; Digifar†; Diosmina Complex; Emortrofine; Facosmina; Flebil Plus; Flebo-Si; Flebofort; Flebolider; Fleboside; Ginkoftal; Levital Plus; Neomyrt Plus; Pulsalux; RepaVen†; Rutisan CE†; Traumal†; Varicofit; Venactive†; Venodin; Venoton; Voltatrauma; ***Malaysia:*** Daflon 500; Ginkor Fort; Hemorid; Nat-C; ***Mex.:*** Cal-Rutina; Daflon; Elatec; Fabroven; Flavit; Phlogenzym; Variton; Venalot; Wobenzym; ***NZ:*** Botanica Hayfever; ***Philipp.:*** Daflon; ***Pol.:*** Alliorut; Anavenol; Ascorutical; Biovision; Cerutin; Cyclo 3 Fort; Detralex; Kelicardina; Pelethrocin; Rutinacea; Rutinoscorbin; Rutinoscorbin Plus; Rutokal C; Rutovit C; Sapoven AT; Sapoven T; Scorbolamid; Troxescorbin; Venacorn; Venescin; ***Port.:*** Actilam; Cegripe; Cyclo 3; Daflon; Rimanal; Rutinice Fortissimo; ***Rus.:*** Anavenol (Анавенол); Antigrippin-ANVI (Антигриппин-АНВИ); Ascorutical (Аскорутикаль); Cyclo 3 Fort (Цикло-3 Форт); Detralex (Детралекс); Ginkor Fort (Гинкор Форт); Ginkor Gel (Гинкор Гель); Indovasin (Индовазин); Phlogenzym (Флогэнзим); Prophylactin C (Профилактин С); Venolife (Венолайф); Wobenzym (Вобэнзим); ***S.Afr.:*** Essaven†; ***Singapore:*** Cyclo 3 Fort; Daflon 500; Diosper; Poly C; ***Spain:*** Caprofides Hemostatico; Daflon 500; Epistaxol; Fabroven; Flebeside†; Gingilone; Nasopomada; ***Switz.:*** Biovital Ginseng; Daflon 500; Demoven N; Flavovenyl; Lapidar 4; Phlebodril N; Video-Net†; ***Thai.:*** Biocalron; Cyclo 3 Fort; Daflon; Dafomin; Essaven; Ginkor Fort; Heroid; Nat-C Medicrafts; Siduol; ***USA:*** Amino-Opti-C; C Factors "1000" Plus; Cholinoid; Citrus-flav C; Ester-C Plus; Ester-C Plus Multi-Mineral; Flavons; Lipoflavonoid; Pan C; Peridin-C; Proflavanol; Pycnogenol Plus; Span C; ***Venez.:*** Daflon; Disolina; Dremo-K†; Phlogenzym; Wobenzym N.

Flopropione *(rINN)*

Flopropiona; Flopropionum; Fluropropiofenone; Phloropropiophenone; RP-13907. 2′,4′,6′-Trihydroxypropiophenone.

Флопропион

$C_9H_{10}O_4$ = 182.2.
CAS — 2295-58-1.



Pharmacopoeias. In *Jpn.*

Profile

Flopropione is an antispasmodic that has been given orally in doses of 40 to 80 mg three times daily.

Preparations

Proprietary Preparations (details are given in Part 3)

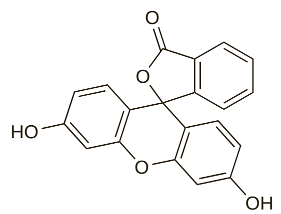
Jpn: Cospanon.

Fluorescein *(BAN)*

Fluoresceína; Fluoresceina; Fluorescéine; Fluoresceinum. 3′,6′-Dihydroxyspiro[isobenzofuran-1(3*H*),9′(9*H*)xanthen]-3-one.

Флуоресцеин

$C_{20}H_{12}O_5$ = 332.3.
CAS — 2321-07-5.
ATC — S01JA01.
ATC Vet — QS01JA01.



Pharmacopoeias. In *Eur* (see p.vii) and *US.*

Ph. Eur. 6.2 (Fluorescein). An orange-red, fine powder. Practically insoluble in water; soluble in hot alcohol. It dissolves in dilute solutions of alkali hydroxides. Protect from light.

USP 31 (Fluorescein). A yellowish-red to red, odourless powder. Insoluble in water; soluble in dilute alkali hydroxides. Store in airtight containers.

Fluorescein Dilaurate *(BANM)*

Fluoresceína, dilaurato de.

Флуоресцеина Дилаурат

$C_{44}H_{56}O_7$ = 696.9.
CAS — 7308-90-9.
ATC — S01JA01.
ATC Vet — QS01JA01.

Fluorescein Sodium *(BANM)*

CI Acid Yellow 73; Colour Index No. 45350; D & C Yellow No. 8; Fluorescein Natrium; Fluorescein sodná sůl; Fluoresceína sódica; Fluorescéine sodique; Fluoresceinnatrium; Fluoresceino natrio druska; Fluoresceinum natricum; Fluoreseiininatrium; Fluoresein Sodyum; Fluoreszcein-nátrium; Obiturin; Resorcinolphthalein Sodium; Sodium Fluorescein; Soluble Fluorescein; Uranin. Disodium fluorescein.

Флуоресцин Натрий

$C_{20}H_{10}Na_2O_5$ = 376.3.
CAS — 518-47-8.
ATC — S01JA01.
ATC Vet — QS01JA01.

NOTE. FLN is a code approved by the BP 2008 for use on single unit doses of eye drops containing fluorescein sodium where the individual container may be too small to bear all the appropriate labelling information. LIDFLN is a similar code approved for eye drops containing lidocaine hydrochloride and fluorescein sodium, and PROXFLN a code for eye drops containing proxymetacaine hydrochloride and fluorescein sodium.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Int., Jpn,* and *US.*

Ph. Eur. 6.2 (Fluorescein Sodium). An orange-red, fine hygroscopic powder. Freely soluble in water; soluble in alcohol; practically insoluble in dichloromethane and in hexane. A 2% solution in water has a pH of 7.0 to 9.0. Store in airtight containers. Protect from light.

USP 31 (Fluorescein Sodium). An orange-red, hygroscopic, odourless powder. Freely soluble in water; sparingly soluble in alcohol. Store in airtight containers.

Adverse Effects and Precautions

The intravenous injection of fluorescein sodium may produce nausea and vomiting. Extravasation is painful. Hypersensitivity reactions range from urticaria to occasional instances of severe anaphylaxis. Cardiac arrests and fatalities have occurred rarely. Concern that impurities or a defect in manufacturing processes might be responsible for the serious reactions led to a review of the BP specification in the early 1980s and a reduction in the permitted level of impurities. Facilities for resuscitation should be available whenever fluorescein sodium is used intravenously.

The skin and urine may be coloured yellow but this is transient. Fluorescein sodium can stain skin, clothing, and soft contact lenses on contact. Intra-ocular fluorescein can produce transient blurring of vision.

Oral fluorescein dilaurate should not be given to patients with acute necrotising pancreatitis. Sulfasalazine may interfere with estimations of fluorescein in the fluorescein dilaurate test.

◊ Two large studies have examined the incidence of adverse reactions after intravenous fluorescein angiography. An international survey[1] collected information concerning 594 687 angiographic procedures; the incidence of serious reactions was 1 in 18 020, and that of fatal reactions, 1 in 49 557. Reactions included anaphylactic shock, cardiac arrest, myocardial infarction, and shock with hypotension or respiratory distress. A US survey of 221 781 fluorescein angiograms[2] reported frequency rates of 1 in 63 for a moderate reaction (urticaria, syncope, thrombophlebitis, pyrexia, tissue necrosis, or nerve palsy) and 1 in 1900 for severe reactions (respiratory or cardiac events or tonic-clonic seizures); there was one death.

Individual reports of adverse reactions to intravenous fluorescein sodium include pancreatitis,[3] painful crises in patients with sickle-cell disease,[4] psoriasiform drug eruption,[5] and photoallergy[6] and phototoxicity.[7]

Uses and Administration

Fluorescein sodium stains damaged cornea and ocular fluids and is applied to the eye for the detection of corneal lesions and foreign bodies, as an aid to the fitting of hard contact lenses, and in various other diagnostic ophthalmic procedures. It is applied as a 1 or 2% solution as eye drops or as sterile papers impregnated with fluorescein sodium. It may also be given with a local anaesthetic, typically as a 0.25% solution with lidocaine hydrochloride, oxybuprocaine hydrochloride, or proxymetacaine hydrochloride.

Fluorescein sodium may be given by rapid intravenous injection, usually as a solution equivalent to fluorescein 10 or 25%, for retinal angiography. The usual dose is the equivalent of 500 mg of fluorescein. A dose of 7.5 mg/kg has been suggested for children. The oral route has also been tried for angiography. Other uses of intravenous fluorescein sodium have included the differentiation of healthy from diseased or damaged tissue and visualisation of the biliary tract.

Fluorescein dilaurate is given by mouth for the assessment of exocrine pancreatic function (see below). Pancreatic enzymes hydrolyse the ester and the amount of free fluorescein excreted in the urine can therefore be taken as a measure of pancreatic activity. A dose of 348.5 mg of fluorescein dilaurate, equivalent to 0.5 mmol of fluorescein, is given with a standard meal, and urine collected for the next 10 hours. The manufacturers give instructions concerning the type and amount of liquid and food which may be taken during this period. A control dose of 188.14 mg of fluorescein sodium, also equivalent to 0.5 mmol of fluorescein, is given on the next day under the same conditions.

Pancreatic function test. Studies of the fluorescein dilaurate test have considered it to be a useful noninvasive screening test for the exclusion of pancreatic exocrine failure in outpatients, particularly those presenting with steatorrhoea.[1-3] The need for tests such as the pancreozymin-secretin test, which requires duodenal intubation, may thus be avoided. However, low specificity (a relatively high rate of false-positive responses) has been reported with the fluorescein dilaurate test in some patient populations,[2,4] and the need for careful patient instruction in performance of the test has been emphasised.[3] In order to avoid the prolonged collection of urine necessary in the standard test, serum concentrations of fluorescein may be measured several hours after taking the test substance.[5]

The test has been used successfully in children,[6] particularly when the doses of fluorescein dilaurate and fluorescein sodium are reduced and fluid intake modified,[7] although the manufacturers recommend that the commercially available test is not used for this age group. In children, a simplified, single-day test using dual markers, fluorescein dilaurate and mannitol, has been investigated with encouraging results.[8] The fluorescein dilaurate test was found to be more sensitive than the faecal elastase 1 test for the diagnosis of mild-to-moderate exocrine pancreatic insufficiency in a study involving 40 patients.[9]

Retinal angiography. Fluorescein is usually given intravenously for retinal angiography, but a study in 20 healthy subjects concluded that an oral dose of fluorescein sodium 25 mg/kg could produce good quality retinal angiograms in the majority of subjects.[1] This study used specially prepared 500-mg capsules of fluorescein sodium; the authors commented that previous oral studies had used the liquid preparation intended for intravenous use. Only mild reactions, possibly due to hypersensitivity, appear to have been reported with oral fluorescein.

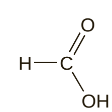
Formic Acid

Ácido amínico; Ácido formílico; Acidum Formicum; Ameisensäure; Aminic Acid; E236; E238 (calcium formate); E237 (sodium formate); Fórmico, ácido; Kwas mrówkowy.

CH_2O_2 = 46.03.
CAS — 64-18-6.
ATC Vet — QP53AG01.



Pharmacopoeias. In *Pol.*

Profile

Formic acid resembles acetic acid in its properties (see p.2244) but is more irritating and pungent. The acid and its sodium and calcium salts are used as preservatives in food. Solutions containing about 60% formic acid have been marketed for the removal of lime scale from kettles. Formic acid has also been used for the removal of tattoos. It is an ingredient of some external preparations promoted for the relief of musculoskeletal and joint disorders, and has been used with benzyl alcohol to aid the removal of nits.

◊ In a report of 3 patients who swallowed descaling agents containing 40 or 55% formic acid, the major complications included local corrosive effects, metabolic acidosis, derangement of blood-clotting mechanisms, and acute onset of respiratory and renal failure.[1] All 3 patients died between 5 and 14 days after admission to hospital. A further report of 53 cases of formic acid ingestion included 15 fatalities.[2]

2. Rajan N, *et al.* Formic acid poisoning with suicidal intent: a report of 53 cases. *Postgrad Med J* 1985; **61:** 35–6.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Acimont; Berggeist; ***Ital.:*** Rubjovit; ***Switz.:*** Fortalis.

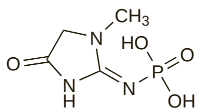
Fosfocreatinine *(rINN)*

Fosfocreatinina; Fosfocréatinine; Fosfocreatininum; Phosphocreatinine. (1-Methyl-4-oxo-2-imidazolidinylidene)phosphoramidic acid.

Фосфокреатинин

$C_4H_8N_3O_4P$ = 193.1.

CAS — 5786-71-0 (fosfocreatinine); 19604-05-8 (fosfocreatinine sodium).



Profile

Fosfocreatinine or fosfocreatinine sodium has been used in muscle disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Sustenium.

Fosfructose Trisodium *(USAN, rINNM)*

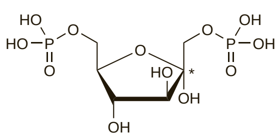
CPC-111; Fosfructosa trisódica; Fosfructose Trisodique; Fosfructosum; Sodium Fructose-1,6-diphosphate. D-Fructose 1,6-bis(dihydrogen phosphate) trisodium octahydrate.

Тринатрий Фосфруктоза

$C_6H_{11}Na_3O_{12}P_2,8H_2O$ = 550.2.

CAS — 488-69-7 (fosfructose); 6055-82-9 (fosfructose calcium); 38099-82-0 (fosfructose trisodium); 81028-91-3 (fosfructose trisodium octahydrate);.

ATC — C01EB07.



and epimer at C*

(fosfructose)

Profile

Fosfructose is a metabolic intermediate. It is used as the trisodium salt as a source of phosphate in deficiency states and in total parenteral nutrition, and has also been used to protect against ischaemic tissue damage. Fosfructose calcium has also been promoted for a variety of disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Hong Kong:*** Esafosfina Glutammica; ***Ital.:*** Esaglut†.

Frankincense

Olibanum; Ru Xiang.

Ладан

CAS — 8016-36-2 (frankincense oil).

NOTE. Distinguish from Indian Frankincense, below.

Profile

Frankincense is the aromatic gum resin of *Boswellia sacra* (*B. carteri*) (Burseraceae) or other species of *Boswellia*. It is used in incense and as a fumigant.

Frankincense (ru xiang) is also used in Chinese medicine. Frankincense oil is used in aromatherapy.

Indian Frankincense

Encens indien; Indian Olibanum; Olibanum indicum; Salai Guggal.

NOTE. Indian frankincense is obtained from *Boswellia serrata* and should be distinguished from Frankincense (above) obtained from other species of *Boswellia*.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Indian Frankincense). Air-dried gum-resin exudate, obtained by incision in the stem or branches of *Boswellia serrata*. It contains a minimum of 1.0% of 11-keto-β-boswellic acid ($C_{30}H_{46}O_4$ = 470.7) and a minimum of 1.0% of acetyl-11-keto-β-boswellic acid ($C_{32}H_{48}O_5$ = 512.7) calculated with reference to the dried drug.

Profile

Indian frankincense is the gum resin of *Boswellia serrata* (*B. glabra*) (Burseraceae). It has anti-inflammatory activity and is included in herbal preparations for musculoskeletal and joint disorders. It is also under investigation for use in inflammatory bowel disease and asthma. Boswellic acids extracted from the gum resin of *B. serrata* have also been tried for their anti-inflammatory actions in similar disorders.

Fucoidan

Fucoidin; Fucoidine; Nemacystus Mucilage.

Фукоидан

CAS — 9072-19-9.

Profile

Fucoidan is a sulfated polysaccharide, based mainly on L-fucose, that is extracted from brown seaweed. It is reported to have anticoagulant, antithrombotic, and antineoplastic activity and has been promoted for a wide-range of disorders and as a food supplement.

Nomenclature. Fucans are a class of sulfated polysaccharides first isolated from marine algae. Their nomenclature can be somewhat varied and confusing. The original polysaccharide isolated from algae was termed fucoidin and this was later changed to fucoidan. These polysaccharides have also been found in marine invertebrates and improved analytical and separation techniques have allowed different types of sulfated polysaccharides to be identified. It has been suggested that the term sulfated fucan should be defined as a polysaccharide based mainly on sulfated L-fucoses, with less than 10% other monosaccharides.[1] This term has been applied to the sulfated fucans of marine invertebrates, whereas the term fucoidan has been used for fucans extracted from algae. Some define fucoidan as a sulfated polysaccharide of L-fucose and D-galactose extracted from brown seaweed although others have used this term for sulfated polysaccharide complexes having a content of L-fucose of only 60% or less. Other terms that have been coined for these compounds include fucansulfate and fucan sulfate.

Fumitory

Erdrauchkraut; Fumaria; Fumariae herba; Fumeterre; Zemědýmová nat'; Ziele dymnicy.

Дымовая Трава; Дымянка Лекарственная

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Fumitory). The whole or fragmented, dried aerial parts of *Fumaria officinalis* harvested in full bloom. It contains a minimum of 0.40% of total alkaloids, expressed as protopine ($C_{20}H_{19}NO_5$ = 353.4). Protect from light.

Profile

Fumitory comprises the dried or fresh flowering plant *Fumaria officinalis* (Papaveraceae) and is used in herbal medicine. It is an ingredient of preparations used mainly for gastrointestinal and biliary-tract disorders.

Homoeopathy. Fumitory has been used in homoeopathic medicines under the following names: Fumaria officinalis.

Irritable bowel syndrome. Neither fumitory nor Javanese turmeric (p.2406) was effective in a study[1] in patients with irritable bowel syndrome.

(gabexate)

Pharmacopoeias. In *Jpn.*

Profile

Gabexate mesilate is a proteolytic enzyme inhibitor that has been used for the treatment of pancreatitis (p.2361) in an initial dose of 100 to 300 mg daily given by intravenous infusion. The dose may be reduced, or a further 100 to 300 mg given on the same day, according to response. It has also been used for disseminated intravascular coagulation (p.1048) in a dose of 20 to 39 mg/kg given as a continuous intravenous infusion over 24 hours. Hypersensitivity reactions including anaphylaxis have occurred.

Gall

Agallas de roble; Aleppo Galls; Blue Galls; Duběnka; Galla; Galläpfel; Galls; Noix de Galle; Nutgall.

Чернильный Орешек

Pharmacopoeias. In *Chin.*

Profile

Gall is the excrescences on the twigs of *Quercus infectoria* (Fagaceae), resulting from the stimulus given to the tissues of the young twigs by the development of the larvae of the gall-wasp, *Adleria gallae-tinctoriae* (*Cynips gallae-tinctoriae*) (Cynipidae). It contains about 50 to 70% of gallotannic acid.

Gall is an astringent and has been used in ointments and suppositories for the treatment of haemorrhoids. It is a source of tannic acid (p.2394).

Preparations

Proprietary Preparations (details are given in Part 3)
Spain: Litiax.

Galsulfase *(BAN, USAN, rINN)*

BM-102; Galsulfasa; Galsulfasum; recombinant human arylsulfatase B; rhASB. *N*-Acetylgalactosamine 4-sulfatase.

Гальсульфас

CAS — 552858-79-4.
ATC — A16AB08.
ATC Vet — QA16AB08.

Profile

Galsulfase is recombinant human *N*-acetylgalactosamine 4-sulfatase used as enzyme replacement therapy in the treatment of mucopolysaccharidosis VI (see below). Galsulfase is given by intravenous infusion in a dose of 1 mg/kg once a week. Infusion reactions are common and patients should be pre-treated with antihistamines with or without antipyretics. Galsulfase should be reconstituted to a final volume of 250 mL in sodium chloride 0.9% and given using an infusion pump. The initial infusion rate should be 6 mL/hour for the first hour, which may then be increased to 80 mL/hour if well tolerated. The total infusion time should be at least 4 hours to minimise the risk of infusion reactions, but may be extended to up to 20 hours, or interrupted, if necessary, in the event of infusion reactions. Patients weighing 20 kg and under may be susceptible to fluid overload and a smaller infusion volume of 100 mL should be considered, in which case, the infusion rate should be decreased accordingly so that the total infusion time is not less than 4 hours.

Adverse effects. References.

Kim KH, *et al.* Successful management of difficult infusion-associated reactions in a young patient with mucopolysaccharidosis type VI receiving recombinant human arylsulfatase B (galsulfase [Naglazyme]). Abstract: *Pediatrics* 2008; **121:** 609. Full version: http://pediatrics.aappublications.org/cgi/content/full/121/3/e714 (accessed 01/05/08)

Mucopolysaccharidosis VI. Mucopolysaccharidosis VI (Maroteaux-Lamy syndrome) is a rare progressive disorder characterised by inherited deficiency of the enzyme *N*-acetylgalactosamine 4-sulfatase, which is necessary to catalyse the hydrolysis of the sulfate moiety of the glycosaminoglycan, dermatan sulfate. This results in accumulation of dermatan sulfate in the lysosomes producing widespread irreversible cellular and tissue damage, and organ dysfunction. There is a rapidly advancing form of the disease that presents in the first year of life characterised by short stature, skeletal and joint deformities, dysmorphic facial features, upper airway obstruction requiring tracheostomy, and recurrent ear infections. There is also a more slowly advancing form that progresses over many decades. Both forms result in significant morbidity and functional problems with a reduced lifespan.[1]

Treatment is supportive and symptomatic involving many body systems; physical and occupational therapy is also necessary.[1] Haematopoietic stem-cell transplantation to supply the deficient enzyme is of benefit to some patients, although it is associated with significant morbidity and mortality.[1] Enzyme replacement therapy with galsulfase has been reported to confer benefit with an acceptable safety profile.[1,2]

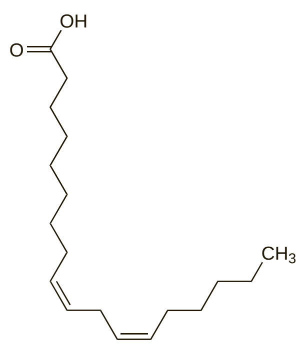
Kwas linolowy; Linoleico, ácido; Linolic Acid; Linolsäure. (*Z,Z*)-Octadeca-9,12-dienoic acid.

Линолевая Кислота

$C_{18}H_{32}O_2$ = 280.4.
CAS — 60-33-3.



Adverse Effects and Precautions

Gamolenic and linoleic acids from evening primrose oil, and presumably other sources, can produce minor gastrointestinal disturbances and headache. They can precipitate symptoms of undiagnosed temporal lobe epilepsy, and should be used with caution in patients with a history of epilepsy or those taking epileptogenic drugs, in particular phenothiazines. Hypersensitivity reactions may also occur.

Uses and Administration

Gamolenic and linoleic acid are essential fatty acids of the omega-6 series that act as prostaglandin precursors. Endogenous gamolenic acid is derived from linoleic acid, which is present in many vegetable oils and is an essential constituent of the diet. The most widely-used source of these acids is evening primrose oil (see p.2302). Gamolenic and linoleic acids have been used in skin disorders and mastalgia, and have been investigated in other disorders including multiple sclerosis, rheumatoid arthritis, and the premenstrual syndrome.

Preparations containing essential fatty acids (formerly known collectively as vitamin F), including arachidonic acid, linoleic acid, linolenic acid (α-linolenic acid, p.1362), oleic acid, and their derivatives, have been used similarly. Conjugated linoleic acid (CLA), a mixture of isomers in which *cis*-9,*trans*-11-octadecadienoic acid and *trans*-10,*cis*-12-octadecadienoic acid predominate, has also been used.

Products containing gamolenic-acid rich plant oils are promoted in many countries as dietary supplements, often in combination with fish oils or other sources of omega-3 fatty acids (see p.1362).

A derivative of gamolenic acid, lithium gamolenate, has been investigated in pancreatic cancer.

Eczema. Atopic eczema (p.1579) may be due to a defect in essential fatty acid metabolism[1,2] and some beneficial symptomatic effects have been reported with evening primrose oil.[1,3] Meta-analysis of 9 studies involving 311 patients[4] has reported improvement in disease symptoms, especially itching, but a subsequent study in 123 patients found no therapeutic effect of evening primrose oil, alone or with fish oil.[5] Although the design and interpretation of this study has been criticised by the manufacturers of evening primrose oil,[6] the authors consider such criticism invalid,[7] and point out that an earlier large study yielded similar results.[8] No difference was found between placebo and evening primrose oil in a further study[9] in children with eczema, and there was also no effect on asthma symptoms in those patients suffering from both disorders. Studies[10,11] of borage oil (another source of gamolenic acid) also found no overall efficacy in adults or children with atopic eczema, although one study noted a suggestion of benefit in a subgroup of patients.[10] In a study[12] of a group of formula-fed infants with a high maternal familial risk of developing atopic eczema, borage oil supplementation did not prevent the expression of atopy, although it showed a tendency to alleviate the severity of the condition later in infancy.

Benefit has been reported in infants with seborrhoeic dermatitis from local application of borage oil.[13]

Mastalgia. Gamolenic acid (usually given in the form of evening primrose oil) has fewer adverse effects than drugs such as danazol or bromocriptine and has been preferred for mastalgia (p.2092), especially in patients with less severe symptoms or those who require prolonged or repeated treatment. However, there is no clear evidence of efficacy.

Multiple sclerosis. There is some evidence that modifying the intake of dietary fats and supplementing the diet with omega-6 polyunsaturated fatty acids, such as linoleic acid, could influence the clinical course of multiple sclerosis (p.892) and many patients practise dietary modification, including taking evening primrose oil. One study[1] has shown a reduction in severity and duration of relapse in patients taking linoleic acid supplements (as sunflower oil), and another[2] has reported benefit in patients who limited their intake of dietary saturated fatty acids and supplemented their diet with polyunsaturated fatty acids. A systematic review[3] of the relationship between dietary interventions (including linoleic acid supplements) and MS concluded that there was insufficient evidence to determine their benefits or risks.

1. Millar JHD, *et al.* Double-blind trial of linoleate supplementation of the diet in multiple sclerosis. *BMJ* 1973; **1:** 765–8.

3. Farinotti M, *et al.* Dietary interventions for multiple sclerosis. Available in The Cochrane Database of Systematic Reviews; Issue 1. Chichester: John Wiley; 2007 (accessed 22/04/08).

Premenstrual syndrome. Progressive improvement in premenstrual syndrome (p.2099) was reported over 5 cycles in an open pilot study in 19 patients receiving evening primrose oil.[1] However, subsequent results have not shown any benefit.[2-4] Evening primrose oil has been considered for cyclical mastalgia (see above).

4. Budeiri DJ, *et al.* Is evening primrose oil of value in the treatment of premenstrual syndrome? *Control Clin Trials* 1996; **17:** 60–8.

Rheumatoid arthritis. Patients with rheumatoid arthritis (p.11) taking NSAIDs have shown subjective improvement after 12 months of treatment with evening primrose oil, with or without fish oil, when compared with placebo.[1] A clinically important reduction in signs and symptoms of disease activity has also been seen in patients treated with gamolenic acid in the form of borage oil.[2] During treatment with evening primrose oil patients with rheumatoid arthritis have increased plasma concentrations of gamolenic, dihomo-gamma-linolenic, and arachidonic acids, and decreased plasma concentrations of oleic and eicosapentaenoic acids and apolipoprotein B.[3] The increase in plasma-arachidonic acid and decrease in eicosapentaenoic acid might be unfavourable in such patients, since arachidonic acid is the precursor of inflammatory prostaglandins and eicosapentaenoic acid may have an anti-inflammatory role. However, a systematic review[4] of these and other studies concluded that there does appear to be some potential benefit for the use of gamolenic acid in rheumatoid arthritis, although optimum dosage and duration of treatment remains to be established.

Gangliosides

Gangliósidos.

Ганглиозиды

Profile

Gangliosides are endogenous substances present in mammalian cell membranes, especially in the cortex of the brain. They are glycosphingolipids composed of a hydrophilic oligosaccharide chain, characterised by sialic acid residues, attached to a lipophilic moiety. The four major gangliosides found in the mammalian brain are referred to as G_{M1}, G_{D1a}, G_{D1b}, and G_{T1b}.

Experimental studies have reported that gangliosides may have a neuroprotective effect on the CNS and peripheral nervous system. Preparations of gangliosides from bovine brain have been given for peripheral neuropathies and cerebrovascular disorders and their role in spinal cord injury has also been investigated. The modified ganglioside siagoside has been studied in patients with Parkinson's disease.

Concern was expressed about the development of Guillain-Barré syndrome and other motor neurone disorders in some patients, and it was suggested that gangliosides were contra-indicated in Guillain-Barré syndrome and all auto-immune disorders. Subsequently these concerns over safety and doubts about efficacy led to the withdrawal of ganglioside preparations in many countries.

4. Eming SA, *et al.* Severe toxic contact dermatitis caused by garlic. *Br J Dermatol* 1999; **141:** 391–2.
5. Lachter J, *et al.* Garlic: a way out of work. *Mil Med* 2003; **168:** 499–500.

Uses and Administration

The constituents of garlic include alliin, allicin, diallyl disulfide, and ajoene. It has traditionally been reported to have expectorant, diaphoretic, disinfectant, and diuretic properties. More recently, it has been investigated for antimicrobial, antihypertensive, lipid-lowering, fibrinolytic, antiplatelet, and cancer protective effects. Garlic oil has also been used.

Homoeopathy. Garlic has been used in homoeopathic medicines under the following names: Allium sativum; All. sat.

Hyperlipidaemia. Garlic has been widely promoted for use in the treatment of hyperlipidaemia (p.1169). Several early placebo-controlled trials[1,2] and meta-analyses[3,4] showed that garlic significantly decreased total serum-cholesterol concentrations. However, more recent data suggest that the effect is at best modest[5] or that there is no significant difference[6-9] when compared with placebo.

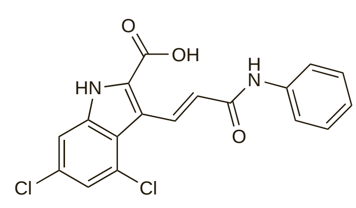
Gavestinel *(BAN, USAN, rINN)*

Gavestinelum; GV-150526X. 4,6-Dichloro-3-[(*E*)-2-(phenylcarbamoyl)vinyl]indole-2-carboxylic acid.

Гавестинел

$C_{18}H_{12}Cl_2N_2O_3$ = 375.2.

CAS — 153436-22-7.



Profile

Gavestinel is a glycine antagonist that has been investigated as a neuroprotectant in stroke.

The symbol † denotes a preparation no longer actively marketed

Stroke. Gavestinel has been tried for its supposed neuroprotective properties in acute stroke, but two major multicentre, randomised controlled studies have failed to show any benefit over placebo in acute ischaemic stroke.[1,2] Analysis of the data from these two studies in patients with primary intracerebral haemorrhage found no benefit of gavestinel in this subgroup either.[3]

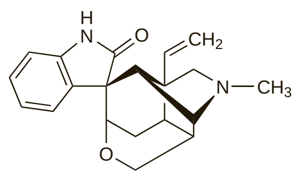
3. Haley EC, *et al.* Gavestinel does not improve outcome after acute intracerebral hemorrhage: an analysis from the GAIN International and GAIN Americas studies. *Stroke* 2005; **36:** 1006–10.

Gelsemium

Gelsemium Root; Jessamine; Yellow Jasmine Root.

Корень Желтого Жасмина

CAS — 509-15-9 (gelsemine).



(gelsemine)

Profile

Gelsemium consists of the dried rhizome and roots of *Gelsemium sempervirens* (Loganiaceae). It contains toxic indole alkaloids including gelsemine ($C_{20}H_{22}N_2O_2$ = 322.4). It depresses the CNS and has been used mainly in neuralgic conditions, particularly trigeminal neuralgia and migraine.

Homoeopathy. Gelsemium has been used in homoeopathic medicines under the following names: Gelsemium sempervirens; Gels.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Fr.:*** Coquelusedal; Coquelusedal Paracetamol.

Gene Therapy

Terapéutica génica.

Генотерапия

Profile

Gene therapy is a product of the increasing knowledge of genetic function and the availability of methods to examine and manipulate the genome. Exogenous genetic material, which may be synthetic or recombinant nucleic acids (p.2355), is introduced into somatic cells (transfection) in such a way that the cells are able to express the products of the new genes. It may be used for therapeutic, prophylactic, or diagnostic purposes. Gene therapy should be distinguished from the use of products derived from organisms (usually micro-organisms) whose genome has been manipulated by similar recombinant DNA technology, for example the use of recombinant cytokines, monoclonal antibodies, or antisense products.

Gene therapy is under investigation in three main areas:

- the replacement of abnormal or defective genes in patients with inherited disease
- the alteration of the characteristics of cells to change their relative susceptibility to other therapies (for example by making haematopoietic stem cells more resistant to the adverse effects of antineoplastics, or by making tumour cells selectively express an enzyme that converts an otherwise non-toxic prodrug into a cytotoxic agent)
- for localised production of a biologically active substance that cannot be given directly or would have unacceptable effects if used systemically.

To date, all gene therapy in humans has been of differentiated somatic cells. Alteration of the human genome in a manner transmissible to offspring, either by treating the germ cells or the early embryo, is considered at present to pose insuperable ethical problems.

Various methods for delivery of genetic material have been investigated, none of which is yet completely satisfactory. These include biological vectors (e.g. viruses or plasmids) or stem cells that have been genetically modified, oncolytic viruses, nucleic acids, either naked plasmids or carried by delivery vehicles, and genetic vaccines. Antisense techniques to modify, correct, or silence aberrant genes are also being developed, as is RNA interference. Xenotransplantation of animal cells may also be an option. Removal of donor cells from the patient followed by *ex vivo* transfer of the new gene (by physical or viral methods) and return of the modified cells may be feasible for modifying haematopoietic stem cells. However, for most tissues, methods of *in vivo* transfer are required. Modified viruses rendered incapable of replicating have been widely studied as vectors for gene therapy. Retroviruses have the advantage that the DNA they carry is integrated into the host genome, resulting in permanent expression of the gene, but there has been some concern that they may disrupt existing genetic material with possibly oncogenic effect; in addition, their small size limits the size of gene that they can carry, and they are largely ineffective in infecting non-dividing cells. Adenoviruses are more stable and can infect non-dividing as well as dividing cells, but their genetic freight is not integrated into the chromosome and transmitted to the cell's progeny, and the gene products are therefore only expressed transiently; they are also highly immunogenic which limits repeated use. Some other viral types, including herpes simplex viruses, adeno-associated viruses, and lentiviruses, are also under investigation. Viruses with tropisms for a particular tissue may be useful in producing localised effects.

Chemical or physical methods for DNA delivery have been extensively investigated. Such methods include direct injection of DNA, the use of DNA complexes bound to a ligand which can be taken up by cells, formulation of DNA in liposomes which can fuse with cell membranes and allow the DNA to enter the cell, and more exotic methods such as 'gene guns', in which DNA-coated gold particles are fired into the cells. Although gene expression can be achieved after use of such methods, it is again transient because the new genetic material is not integrated with that of the host, and physical methods are currently less efficient and more limited in scope than viral ones.

Numerous clinical studies are being carried out. The first successful therapy was for severe combined immunodeficiency, a single-gene disorder due to deficiency of the enzyme adenosine deaminase. Transfection of the gene for this enzyme into the patient's T-cells *ex vivo* and re-infusion of the modified T-cells has been shown to produce substantial clinical improvement, although therapy must be repeated periodically because of the limited lifespan of the lymphocytes.

Studies in patients with cystic fibrosis have also shown some success, and a number of other single-gene disorders, including alpha$_1$ antitrypsin deficiency, familial hypercholesterolaemia, Gaucher disease, the haemoglobinopathies and haemophilias, and Duchenne muscular dystrophy are being studied or have been proposed as possible candidates.

Gene therapy is also under investigation in various acquired diseases, particularly in the management of various types of cancer. Strategies being studied include modification of tumour cells either to increase their immunogenicity or to render them selectively sensitive to antineoplastics, and transfection of tumour cells with tumour suppressor genes. Other disorders being studied clinically include HIV infection, rheumatoid arthritis, Parkinson's disease and atherosclerosis.

Gentian

Bitter Root; Enzianwurzel; Genciana; Gencijonų šaknys; Gentian Root; Gentiana; Gentianae radix; Gentianarot; Gentiane; Gentiane, racine de; Genziana; Hořcový kořen; Katkeronjuuri; Korzeń goryczki; Raiz de Genciana; Tárnicsgyökér.

Горький Корень

Pharmacopoeias. In *Eur.* (see p.vii), and *Jpn.*

Jpn includes Japanese Gentian, from *G. scabra* and other species.

Chin. also specifies *G. scabra* and other species.

Ph. Eur. 6.2 (Gentian Root; Gentian BP 2008). The dried, fragmented underground organs of *Gentiana lutea* yielding not less than 33% of water-soluble extractive. It has a characteristic odour. Protect from light.

Profile

Gentian is used as a bitter. An alcoholic infusion of gentian, bitter-orange peel, and lemon peel has been used as an ingredient in a number of bitter mixtures.

Homoeopathy. Gentian has been used in homoeopathic medicines under the following names: Gentiana lutea; Gent. lut.

Preparations

BP 2008: Acid Gentian Mixture; Alkaline Gentian Mixture; Compound Gentian Infusion; Concentrated Compound Gentian Infusion;
Ph. Eur.: Gentian Tincture.

Proprietary Preparations (details are given in Part 3)

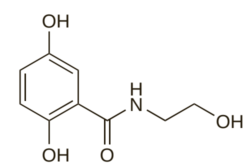
Gentisic Acid Ethanolamide

Etanolamida del ácido gentísico. 2,5-Dihydroxybenzoic acid ethanolamide.

$C_9H_{11}NO_4$ = 197.2.

CAS — 61969-53-7.



Profile

Gentisic acid ethanolamide has been used as a complexing agent in the manufacture of pharmaceutical preparations.

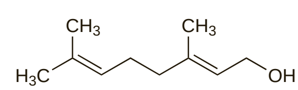
Geraniol

Lemonol. (*E*)-3,7-Dimethyl-2,6-octadien-1-ol; .

Гераниол

$C_{10}H_{18}O$ = 154.2.

CAS — 106-24-1.



Profile

Geraniol is a constituent of several essential oils and is used in insect repellent preparations. It was formerly used as an anthelmintic. Geraniol is also used as a flavour and in perfumery. Contact dermatitis has been reported.

◊ References.

Preparations

Proprietary Preparations (details are given in Part 3)
USA: Cholestin.

Multi-ingredient: ***Canad.:*** Natrapel; ***Fr.:*** Biolau; Moustidose.

Geranium Oil

Aetheroleum Pelargonii; Geranii Etheroleum; Geranio, aceite esencial de; Geraniová silice; Oleum Geranii; Pelargonium Oil; Rose Geranium Oil.

Гераниевое Масло

Profile

Geranium oil is a volatile oil obtained by distillation from the aerial parts of various species and hybrid forms of *Pelargonium* (Geraniaceae). It contains geraniol (p.2310). It is used to perfume various preparations and has been included in insect repellent preparations. It is also used in aromatherapy.

Adverse effects. Allergic reactions have been reported[1] with herbal preparations containing extracts of *Pelargonium sidoides* and *P. reniforme* used for respiratory-tract infections.

1. de Boer HJ, *et al.* Allergic reactions to medicines derived from Pelargonium species. *Drug Safety* 2007; **30:** 677–80.

Postherpetic neuralgia. A study[1] involving 30 patients has indicated that topically applied geranium oil is of benefit in the management of the pain of postherpetic neuralgia. Pain relief was obtained within a few minutes but further study is required to determine the duration of effect beyond 1 hour. Adverse effects were considered to be minor and included burning in the eye, skin rash, and lightheadedness.

1. Greenway FL, *et al.* Temporary relief of postherpetic neuralgia pain with topical geranium oil. *Am J Med* 2003; **115:** 586–7.

Germanium

Germanio.

Ge = 72.64.

CAS — 7440-56-4.

Profile

Germanium compounds have been used in dietary supplements promoted for conditions including cancer, chronic fatigue syndrome, and immunodeficiency disorders. However, germanium compounds can produce severe renal damage and their use should be discouraged.

Germanium has also been used in dental alloys and has various industrial uses.

Effects on the kidneys. In the UK the DOH has recommended that germanium should not be taken as a dietary supplement because of a significant incidence of renal toxicity. There have been a number of reports of severe renal damage, including fatalities, resulting from germanium ingestion.

References.

Ginkgo Biloba

Árbol de los cuarenta escudos; EGB-761; Fossil Tree; GBE-761; Ginkgo, feuille de (ginkgo leaf); Ginkgo folium (ginkgo leaf); Ginkgoblad (ginkgo leaf); Ginkmedžių lapai (ginkgo leaf); Jinanový list (ginkgo leaf); Kew Tree; Maidenhair Tree; Neidonhiuspuunlehti (ginkgo leaf); Páfrányfenyőlevél (ginkgo leaf); *Salisburia adiantifolia.*

Гинкго Билоба

ATC — N06DX02.

ATC Vet — QN06DX02.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *US. Eur.* (see p.vii) also includes Ginkgo Dry Extract, Refined and Quantified. *US* includes a powdered extract.

Ph. Eur. 6.2 (Ginkgo Leaf). The whole or fragmented dried leaf of *Ginkgo biloba* containing not less than 0.5% of flavonoids, calculated as flavone glycosides with reference to the dried drug. The leaf is greyish or yellowish-green or yellowish-brown.

USP 31 (Ginkgo). The dried leaf of *Ginkgo biloba* (Ginkgoaceae) containing not less than 0.5% of flavonoids, calculated as flavonol glycosides, with a mean molecular mass of 756.7, and not less than 0.1% of terpene lactones, both on the dried basis. The leaf is khaki green to greenish-brown. Protect from light and moisture.

Adverse Effects

Adverse effects include headaches, dizziness, palpitations, gastrointestinal disturbances, bleeding disorders, and skin hypersensitivity reactions.

Poisoning. Reports[1,2] of convulsions induced by ingestion of large amounts of ginkgo seeds. Convulsions were thought to be due to the presence of 4-metoxypyridoxine, a competitive antagonist of pyridoxine; giving suitable quantities of a vitamin-B_6 source may be of benefit in preventing such convulsions.[2]

1. Miwa H, *et al.* Generalized convulsions after consuming a large amount of gingko nuts. *Epilepsia* 2001; **42:** 280–1.
2. Kajiyama Y, *et al.* Ginkgo seed poisoning. *Pediatrics* 2002; **109:** 325–7.

Interactions

It has been suggested that ginkgo biloba should be used with caution in patients receiving anticoagulants or drugs that affect platelet aggregation. For reference to a possible interaction with *warfarin*, see p.1431.

Uses and Administration

An extract from the leaves of *Ginkgo biloba* has been used in cerebrovascular and peripheral vascular disorders. It is also being investigated in Alzheimer's disease, multi-infarct dementia, and in tinnitus. *Ginkgo biloba* is a source of ginkgolides (below).

Homoeopathy. Ginkgo biloba has been used in homoeopathic medicines under the following names: Ginkgo.

Cerebrovascular disorders. A systematic review[1] of 10 randomised or quasi-randomised studies concluded that the routine use of ginkgo biloba extracts to promote recovery after ischaemic stroke was not supported by any convincing evidence, and that larger better quality studies were required.

1. Zeng X, *et al.* Ginkgo biloba for acute ischaemic stroke. Available in the Cochrane Database of Systematic Reviews; Issue 4. Chichester: John Wiley; 2005 (accessed 23/05/06).

Dementia. Ginkgo biloba extracts have been tried in the treatment of dementia including Alzheimer's disease (p.362). Meta-analyses[1-3] have found the extracts to be more effective than placebo in some cases but results are inconsistent and unconvincing[3] and the authors of all analyses commented that further investigation is needed to establish any clinical value. A subsequent study found no evidence of benefit.[4] Another study assessing whether ginkgo biloba can prevent cognitive decline in very elderly people with normal memory function found positive effects only after adjustment for noncompliance.[5] In this study[5] a greater number of cases of stroke or transient ischaemic attacks was noted in those given ginkgo biloba but further study is required to confirm any link to use of ginkgo.

5. Dodge HH, *et al.* A randomized placebo-controlled trial of Ginkgo biloba for the prevention of cognitive decline. *Neurology* 2008; **70:** 1809–17.

Peripheral vascular disorders. Ginkgo biloba extracts have been tried in the treatment of peripheral vascular disorders (p.1178). A meta-analysis[1] found the extracts to be more effective than placebo in the symptomatic treatment of intermittent claudication, although the authors considered the size of the effect to be modest and of uncertain clinical relevance.

Tinnitus. Ginkgo biloba extracts have been tried in the treatment of tinnitus (p.1866). A systematic review[1] of 5 randomised controlled studies cautiously concluded that these results were favourable, although a later systematic review[2] failed to show benefit.

Ginkgolides

Ginkgólidos.

Гинкголиды

CAS — 15291-75-5 (ginkgolide A); 15291-77-7 (ginkgolide B); 15291-76-6 (ginkgolide C).

	R^1	R^2	R^3
ginkgolide A	OH	H	H
ginkgolide B	OH	OH	H
ginkgolide C	OH	OH	OH

(ginkgolide A)

Description. Ginkgolides A, B, and C (BN-52020, BN-52021, and BN-52022 respectively) are isolated from *Ginkgo biloba* (Ginkgoaceae) (see above).

Profile

Ginkgolides are terpenoid molecules isolated from *Ginkgo biloba* (above), with platelet-activating factor (PAF) antagonist properties. They have been investigated as BN-52063, a mixture of ginkgolides A (BN-52020), B (BN-52021), and C (BN-52022), for asthma and other inflammatory and allergic disorders, and also in immune disorders such as endotoxic shock and graft rejection; ginkgolide B, which has the most potent PAF antagonist properties, has been tried alone in similar conditions.

Other ginkgolides, including ginkgolide M (BN-52023) and ginkgolide J (BN-52024), have also been identified.

Preparations

Proprietary Preparations (details are given in Part 3)
Turk.: Bilokan; Seremaks; Tebokan.

Ginseng

Ginseng radix; Ginzenggyökér; Jintsam; Ninjin; Panax; Pannag; Renshen; Schinsent; Všehojový kořen; Ženšenių šaknys.

Description. Ginseng is the dried root of *Panax ginseng* (*P. schinseng*) (Araliaceae). Other varieties of ginseng include *Panax quinquefolius* (American Ginseng) and *P. pseudoginseng*. The root commonly known as Siberian or Russian ginseng belongs to the same family, Araliaceae, but is an entirely different plant, *Eleutherococcus senticosus* (see Siberian Ginseng, p.2386). Brazilian ginseng is reported to be derived from another unrelated plant, *Pfaffia paniculata*.
Ginseng contains complex mixtures of saponins termed ginsenosides or panaxosides. At least 13 saponins have been isolated from extracts of *P. ginseng* roots.

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), and *Jpn*. Also in *US* (as Asian Ginseng and American Ginseng). *US* includes additionally powdered forms of these two varieties of ginseng.
Jpn also includes Red Ginseng, the dried root of *P. ginseng* which has been steamed.
Chin. and *Jpn* also include Rhizoma Panacis Japonica from *Panax japonicus*. *Eur.* (see p.vii) also includes Notoginseng Root from *P. notoginseng*. *Chin.* also includes Radix Notoginseng from *P. notoginseng*, and Rhizoma Panacis Majoris from *P. japonicus* var. *major* and *P. japonicus* var. *bipinnatifidus*.
Ph. Eur. 6.2 (Ginseng). The whole or cut dried root of *Panax ginseng*. It contains not less than 0.4% of combined ginsenosides, Rg1 ($C_{42}H_{72}O_{14},2H_2O = 837.0$) and Rb1 ($C_{54}H_{92}O_{23},3H_2O = 1163.3$), calculated with reference to the dried drug. Protect from light.
USP 31 (Asian Ginseng). The dried roots of *Panax ginseng* (Araliaceae). It contains not less than 0.2% of ginsenoside Rg_1 and not less than 0.1% of ginsenoside Rb_1, both calculated on the dried basis. Store in a dry place at a temperature of 8° to 15°.
USP 31 (American Ginseng). The dried roots of *Panax quinquefolius* (Araliaceae). It contains not less than 4.0% of total ginsenosides, calculated on the dried basis. Store in airtight containers. Protect from light and heat.

Adverse Effects

◊ A 2-year study[1] of ginseng in 133 subjects who had used commercial preparations including roots, capsules, tablets, teas, extracts, cigarettes, chewing gum, and candies reported that the majority of preparations were taken orally, but a few subjects had experimented with intranasal or parenteral routes, and topical preparations had also been used. The stimulant effects of ginseng were confirmed but there was also a high incidence of adverse effects including 47 cases of morning diarrhoea, 33 of skin eruptions, 26 of sleeplessness, 25 of nervousness, 22 of hypertension, 18 of euphoria, and 14 of oedema. The 'ginseng abuse syndrome' defined as hypertension together with nervousness, sleeplessness, skin eruptions, and morning diarrhoea was experienced by 14 subjects who took ginseng orally in an average daily dose of 3 g. Abrupt withdrawal precipitated hypotension, weakness, and tremor in 1 user. About 50% of the subjects had stopped the use of ginseng within the 2 years. Oestrogenic effects have also been reported from the use of ginseng,[2-4] and a case of Stevens-Johnson syndrome has also occurred.[5]
A systematic review[6] of some of these and other studies and case reports concluded that single-ingredient preparations of ginseng were well tolerated when data from clinical studies were examined. Adverse effects were generally mild and reversible, the most common being headache, sleep disturbances, and gastrointestinal disorders. It was more difficult to determine causality from the evidence given in isolated case reports; likewise, interpretation of data involving combination products was difficult.

6. Coon JT, Ernst E. Panax ginseng: a systematic review of adverse effects and drug interactions. *Drug Safety* 2002; **25:** 323–44.

Interactions

◊ For reports of interactions between *phenelzine* and ginseng, see p.419. For details of an interaction between *warfarin* and ginseng, see p.1431. For a suggestion that ginseng may interfere with *digoxin* assays, see p.1260.

Uses and Administration

Ginseng is reported to enhance the natural resistance and recuperative power of the body and to reduce fatigue. It is available commercially as roots, powdered roots, tablets, capsules, teas, oils, or extracts.

Preparations

USNF 26: American Ginseng Capsules;
USP 31: American Ginseng Tablets; Asian Ginseng Tablets.

Glatiramer Acetate *(BAN, USAN)*

COP-1; Copolymer 1; Glatirameeriasetaatti; Glatiramer, acetato de; Glatiramer Asetat; Glatirameracetat; Glatirameri Acetas. L-Glutamic acid polymer with L-alanine, L-lysine and L-tyrosine, acetate.

Глатирамер Ацетат

CAS — 28704-27-0 (glatiramer); 147245-92-9 (glatiramer acetate).

ATC — L03AX13.

ATC Vet — QL03AX13.

Adverse Effects and Precautions

Immediate post-injection reactions are common with glatiramer acetate and include chest pain, palpitations or tachycardia, dyspnoea, throat constriction, urticaria, flushing (vasodilatation), and anxiety. These reactions are generally short-lived and resolve spontaneously. They have generally occurred only some months after treatment with glatiramer was started. Other common adverse effects include asthenia, nausea, constipation, diarrhoea, rash, sweating, arthralgia, hypertonia, and dizziness. Convulsions and anaphylactoid reactions have been reported rarely. Antibodies to the drug develop with chronic therapy but are of unknown clinical significance. Pain, erythema, inflammation, mass, pruritus, and induration may occur at the injection site; localised lipoatrophy and, rarely, skin necrosis has also been reported.

Glatiramer acetate should be given with caution to patients with pre-existing cardiac disorders; such patients should be followed up regularly during treatment.

◊ References.

Anaphylaxis. A systemic anaphylactic reaction to glatiramer acetate developed in a patient who showed a strong immunoglobulin response including specific immunoglobulin E.[1]

1. Rauschka H, *et al.* Severe anaphylactic reaction to glatiramer acetate with specific IgE. *Neurology* 2005; **64:** 1481–2.

Effects on the skin. Localised lipoatrophy at the injection site developed in 6 patients receiving glatiramer acetate.[1] Examination of 76 patients over a 6-month period in one centre[2] revealed evidence of lipoatrophy in at least one injection site in 34 patients; of these, 5 cases were severe. Prevalence of lipoatrophy was much higher than expected, and in some cases, it occurred only a few months after treatment started.[2]
Erythema nodosum confirmed by biopsy has been reported in one patient;[3] spontaneous resolution occurred without stopping treatment.

3. Thouvenot E, *et al.* Erythema nodosum and glatiramer acetate treatment in relapsing-remitting multiple sclerosis. *Multiple Sclerosis* 2007; **13:** 941–4.

Interactions

UK licensed product information reports that an increased incidence of injection-site reactions to glatiramer acetate has been seen in patients also given corticosteroids.

Pharmacokinetics

A substantial fraction of a subcutaneous dose of glatiramer is believed to be hydrolysed locally. Some of the injected dose is also presumed to enter the lymphatic system, either intact or partially hydrolysed.

Uses and Administration

Glatiramer acetate, a random polymer of L-alanine, L-glutamic acid, L-lysine, and L-tyrosine, is a polypeptide that has some structural resemblance to myelin basic protein, and is used to reduce the frequency of relapses in the management of relapsing-remitting multiple sclerosis (p.892). It is given by subcutaneous injection in a dose of 20 mg daily. It should not be given by the intravenous or intramuscular route. An oral formulation has been investigated with disappointing results.

Multiple sclerosis. Reviews[1,2] and a meta-analysis[3] of controlled studies of glatiramer acetate in the treatment of multiple sclerosis concluded that it is of benefit, although one systematic review[4] questions this and failed to find evidence to support its routine use. The mechanism of glatiramer acetate has also been reviewed.[5]

Glucomannan

E425; Glucomanano; Harina de Konjac; Konjac Flour; Konjac Mannan.

Profile

Glucomannan, a powdered extract from the tubers of *Amorphophallus konjac*, has been promoted as an anorectic. It has been claimed to reduce the appetite by absorbing liquid in the gastrointestinal tract. It is also used in the treatment of constipation and hyperlipidaemia. Glucomannan has been investigated as a dietary adjunct in the management of diabetes mellitus.

There is a risk of intestinal or oesophageal obstruction and faecal impaction, especially if it is swallowed dry. Therefore, it should always be taken with sufficient fluid and should not be taken immediately before going to bed. It should be avoided in patients who have difficulty swallowing.

Pharmacopoeias. In *US.*

USP 31 (Gluconolactone). A fine, white, practically odourless, crystalline powder. Freely soluble in water; sparingly soluble in alcohol; insoluble in ether.

Profile

Gluconolactone is hydrolysed to gluconic acid, a polyhydroxy acid. It has similar properties to the alpha hydroxy acids glycolic acid (p.1598) and mandelic acid (p.296) and has been used in skin disorders and for urinary catheter care. Gluconolactone and gluconic acid are also used as food additives.

Proprietary Preparations (details are given in Part 3)

Ital.: Neostrata.

Multi-ingredient: ***Arg.:*** Neoceuticals Crema Despigmentante de Dia†; Neoceuticals Gel de Limpieza Facial; Neostrata; ***Austral.:*** Neostrata; ***Canad.:*** Neostrata; ***Chile:*** Neostrata; ***Fr.:*** Ruboderm Plus; ***UK:*** Uriflex R; Uro-Tainer Solution R; ***USA:*** Renacidin.

Glucosamine *(USAN, rINN)*

Chitosamine; Glucosamina; Glucosaminum; NSC-758. 2-Amino-2-deoxy-β-D-glucopyranose.

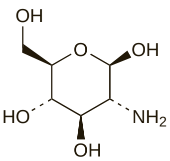
Глюкозамин

$C_6H_{13}NO_5$ = 179.2.

CAS — 3416-24-8.

ATC — M01AX05.

ATC Vet — QM01AX05.



Glucosamine Hydrochloride *(rINNM)*

Chitosamine Hydrochloride; Glucosamine, Chlorhydrate de; Glucosamini Hydrochloridum; Glukozaminy chlorowodorek; Hidrocloruro de glucosamina.

Глюкозамина Гидрохлорид

$C_6H_{13}NO_5,HCl$ = 215.6.

CAS — 66-84-2.

Pharmacopoeias. In *US.*

USP 31 (Glucosamine Hydrochloride). A 2% solution in water has a pH of 3.0 to 5.0. Store in airtight containers. Protect from light.

Glucosamine Sulfate Potassium Chloride

$(C_6H_{14}NO_5)_2SO_4,2KCl$ = 605.5.

Pharmacopoeias. In *US.*

USP 31 (Glucosamine Sulfate Potassium Chloride). A 2% solution in water has a pH of 3.0 to 5.0. Store in airtight containers. Protect from light.

Glucosamine Sulfate Sodium Chloride

$(C_6H_{14}NO_5)_2SO_4,2NaCl$ = 573.3.

Pharmacopoeias. In *US.*

USP 31 (Glucosamine Sulfate Sodium Chloride). A 2% solution in water has a pH of 3.0 to 5.0. Store in airtight containers. Protect from light.

Profile

Glucosamine is a natural substance found in chitin, mucoproteins, and mucopolysaccharides. It is involved in the manufacture of glycosaminoglycan, which forms cartilage tissue in the body; glucosamine is also present in tendons and ligaments. Glucosamine must be synthesised by the body but the ability to do this declines with age. Glucosamine and its salts have therefore been advocated in the treatment of rheumatic disorders including osteoarthritis. Glucosamine may be isolated from chitin or prepared synthetically; glucosamine sulfate and hydriodide, have also been used.

Effects on glucose metabolism. Glucosamine has a role in glucose metabolism, increasing insulin resistance in skeletal muscle,[1,2] which has raised concerns about its safety profile in diabetic patients.[3] However, alteration of glycaemic homoeostasis was not found in a 3-year randomised controlled study in patients without diabetes.[4] A review[5] of the literature found limited data on diabetic patients taking glucosamine supplements, and recommended close monitoring of blood glucose levels in this group until more data are available.

Osteoarthritis. Glucosamine and its salts are widely available as licensed products or so-called 'health supplements' used for the management of osteoarthritis (p.11); they may be combined with other substances supposed to be of benefit, including chondroitin (p.2280), vitamins, and various herbs. Meta-analyses[1,2] of randomised placebo-controlled studies concluded that while there was some evidence for efficacy of glucosamine and chondroitin in the treatment of osteoarthritis, methodological flaws and publication bias had led to exaggeration of its potential benefit,[1] and that further studies are needed to fully characterise their disease-modifying properties.[2] A systematic review[3] of the use of glucosamine for osteoarthritis that included later controlled studies concluded that glucosamine is as safe as placebo but there was little evidence of improvement in pain or function. A further randomised controlled study[4] in 222 patients with hip osteoarthritis found no benefit after treatment with glucosamine for 2 years compared with placebo, and a meta-analysis[5] of controlled studies of chondroitin for osteoarthritis of the knee or hip concluded that chondroitin had minimal or no benefit. Further research is needed to confirm whether there are differences in efficacy between glucosamine salts, preparations, or routes, and when used with other agents (e.g. chondroitin) or in different patient subgroups.[3] A large multicentre double-blind study[6] in 1583 patients with symptomatic knee osteoarthritis to compare glucosamine and chondroitin, either alone or in combination, found no clear evidence of benefit in pain reduction compared with placebo or celecoxib, although there was a tendency to more positive results in a subset of patients with moderate to severe knee pain.

Skin reactions. The Australian Adverse Drug Reactions Advisory Committee (ADRAC)[1] has received 51 reports of allergic skin reactions with glucosamine, including erythematous rash, angioedema, urticaria, rash, and pruritus. It was noted that some preparations contain glucosamine sourced from seafood and therefore people with an allergy to shellfish may be at greater risk for hypersensitivity reactions.

Glucose Oxidase

Corylophyline; β-D-Glucopyranose aerodehydrogenase; Glucosa oxidasa; Microcide; Notatin; P-FAD.

CAS — 9001-37-0.

Profile

Glucose oxidase is an enzyme obtained from certain fungi, which catalyses the oxidation of glucose to gluconic acid, with the concomitant production of hydrogen peroxide. It is used for its preservative properties as an additive in certain foods, sometimes with catalase (p.2278). It is also used in fertility tests and tests of diabetic control. It has been used as an ingredient of toothpastes for its supposed benefits in the prophylaxis of dental caries.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Braz.:*** Bromelin†; Expectoral†; ***Singapore:*** Biotene; ***UK:*** Biotene Dry Mouth; Biotene Oralbalance; ***USA:*** Biotene with Calcium.

Glucose Tests

Glucosa, pruebas de.

Profile

Several tests are available so that patients with diabetes mellitus (p.431) can monitor their disease. Tests can be employed to detect the presence of glucose in the urine and some of the preparations are used to detect several substances in the urine. These tests are easy to carry out but are not considered reliable enough for insulin-dependent patients who should ideally check their blood-glucose concentrations using one of the available blood tests. Diabetic clinics often measure the degree of haemoglobin glycosylation as an indicator of mean blood-glucose control over a period of weeks or months.

Urine tests generally use either the copper-reduction method or the glucose-oxidase method and both produce a colour change in the presence of glucose. Blood tests generally use the glucose-oxidase method; they may be read visually or by means of a meter. A meter gives the more precise reading. Patients should be properly trained in the use of these tests and in the interpretation of the results; they should be aware that concomitant drug therapy might affect the result.

Precautions. Preparations that contain, or are metabolised to, maltose (p.1956), galactose (p.1481), or xylose (p.2416) may interfere with the results from glucose tests based on dehydrogenase pyrroloquinolinequinone (GDH-PQQ) monitoring systems as these are non-specific for glucose. Overestimation of glucose results may mask hypoglycaemia, resulting in the inappropriate use of insulin.[1,2]

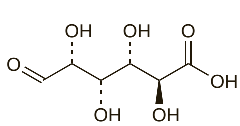
Glucuronic Acid

D-Glucuronic acid.

$C_6H_{10}O_7$ = 194.1.

CAS — 576-37-4 (D,L-glucuronic acid); 6556-12-3 (D-glucuronic acid); 3789-97-7 (glucuronamide); 3574-23-0 (D-glucuronamide); 61914-43-0 (D-glucuronamide); 63-29-6 (glucurolactone); 32449-92-6 (glucurolactone); 14984-34-0 (sodium glucuronate).



(D-glucuronic acid)

Profile

Glucuronic acid is one of the components of hyaluronic acid (p.2320) and also has an important role in the metabolism of many endogenous substances, drugs, and toxins. It has been used topically as a potential precursor of hyaluronic acid, and has also been used as a nutritional supplement. Glucuronamide, glucurolactone (glucuronic acid lactone), diolamine glucuronate, and other glucuronates have also been used as supplements.

Preparations

Proprietary Preparations (details are given in Part 3)

Hong Kong: Guronsan†.

Gluten

Profile

Gluten is a mixture of 2 proteins, gliadin and glutenin, and is present in wheat flour and to a lesser extent in barley and rye. Gliadin is a prolamine, one of the 2 chief groups of plant proteins, and glutenin belongs to the other main group termed glutelins.

Gluten is of medicinal and pharmaceutical interest in that patients with coeliac disease (p.1922) are sensitive to the protein fraction of gluten contained in the normal diet. Treatment consists of the use of gluten-free diets; gluten-free foods are available.

A gluten-free diet may also be beneficial in patients with dermatitis herpetiformis (p.1578).

Glycerol *(rINN)*

E422; Glicerin; Glicerol; Glicerolis; Gliserin; Gliserol; Glisin; Glycerin; Glycerine; Glycérol; Glycerolum; Glyseroli. Propane-1,2,3-triol.

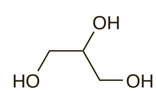
Глицерол

$C_3H_8O_3$ = 92.09.

CAS — 56-81-5.

ATC — A06AG04; A06AX01.

ATC Vet — QA06AG04; QA06AX01; QA16QA03.



Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Int., Jpn, US,* and *Viet.*

Eur. and *Int.* also include Glycerol (85 per cent).

Ph. Eur. 6.2 (Glycerol). A clear, colourless or almost colourless, very hygroscopic, syrupy liquid, unctuous to the touch. Miscible with water and with alcohol; slightly soluble in acetone; practically insoluble in fixed oils and in essential oils. Store in airtight containers.

USP 31 (Glycerin). A clear, colourless, hygroscopic, syrupy liquid. Has not more than a slight characteristic odour, which is neither harsh nor disagreeable. Miscible with water and with alcohol; insoluble in chloroform, in ether, and in fixed and volatile oils. Its solutions are neutral to litmus. Store in airtight containers.

Incompatibility. Strong oxidising agents form explosive mixtures with glycerol. Black discoloration has been reported with glycerol and bismuth subnitrate or zinc oxide when exposed to light.

Adverse Effects and Precautions

The adverse effects of glycerol are primarily due to its dehydrating action.

When taken orally glycerol may cause headache, nausea, and vomiting; diarrhoea, thirst, dizziness, and mental confusion may occur less frequently. Cardiac arrhythmias have been reported.

Glycerol increases plasma osmolality resulting in the withdrawal of water from the extravascular spaces. The consequent expansion of extracellular fluid, especially if sudden, can lead to circulatory overload, pulmonary oedema, and heart failure; glycerol must therefore be used with caution in patients at risk, such as those with hypervolaemia, cardiac failure, or renal disease. Severe dehydration can occur and glycerol should be used cautiously in dehydrated patients. Patients with diabetes mellitus may additionally develop hyperglycaemia and glycosuria after metabolism of glycerol. Nonketotic hyperosmolar hyperglycaemic coma is rare, but fatalities have been reported.

Haemolysis, haemoglobinuria, and acute renal failure have also been associated with glycerol when given intravenously (see Raised Intracranial Pressure, below).

Glycerol can cause irritation when given topically or rectally. A local anaesthetic may be used before application of glycerol to the cornea to reduce the likelihood of a painful response.

For incompatibilities with glycerol, including the risk of explosive mixtures, see above.

Effects on the cardiovascular system. A 73-year-old man, free of cardiac complaints but who had previously had an acute myocardial infarction, developed severe pulmonary oedema after use of glycerol orally for elevated intra-ocular pressure.[1] The necessity for detailed cardiac evaluation before the use of oral glycerol was emphasised.

1. Almog Y, *et al.* Pulmonary edema as a complication of oral glycerol administration. *Ann Ophthalmol* 1986; **18:** 38–9.

Effects on the ears. A 56-year-old man given 100 mL of glycerol and 100 mL of sodium chloride 0.9% as part of a test for Ménière's disease developed temporary hearing loss in the non-involved ear. Two previous reports of deterioration in hearing associated with the glycerol test were reviewed by the author.[1]

1. Mattox DE, Goode RL. Temporary loss of hearing after a glycerin test. *Arch Otolaryngol* 1978; **104:** 359–61.

Effects on the eyes. Caution in applying glycerol to the cornea has been recommended. Studies in *animals*[1] and in man[2] have indicated that the topical application of glycerol to the eye can damage the endothelial cells of the cornea.

1. Sherrard ES. The corneal endothelium in vivo: its response to mild trauma. *Exp Eye Res* 1976; **22:** 347–57.
2. Goldberg MH, *et al.* The effects of topically applied glycerin on the human corneal endothelium. *Cornea* 1982; **1:** 39–44.

Hyperosmolar nonketotic coma. Hyperosmolar nonketotic coma has been associated with the oral use of glycerol[1] and deaths have occurred.[2] The most susceptible patients are maturity-onset elderly diabetics with acute or chronic disease predisposing to fluid deprivation, and in these patients oral glycerol may be best avoided.[1] If glycerol is used in patients with predisposing conditions, adequate measures should be taken to recognise the development of hyperosmolar nonketotic hyperglycaemia and prevent dehydration.[1,2]

1. Oakley DE, Ellis PP. Glycerol and hyperosmolar nonketotic coma. *Am J Ophthalmol* 1976; **81:** 469–72.
2. Sears ES. Nonketotic hyperosmolar hyperglycemia during glycerol therapy for cerebral edema. *Neurology* 1976; **26:** 89–94.

Pharmacokinetics

Glycerol is readily absorbed from the gastrointestinal tract and undergoes extensive metabolism, mainly in the liver; it may be used in the synthesis of lipids, metabolised to glucose or glycogen, or oxidised to carbon dioxide and water. It may also be excreted in the urine unchanged.

Uses and Administration

Glycerol is an osmotic dehydrating agent with hygroscopic and lubricating properties. When given orally or parenterally, glycerol increases the plasma osmolality, resulting in the movement of water by osmosis from the extravascular spaces into the plasma.

Glycerol is given by mouth for the short-term reduction of vitreous volume and intra-ocular pressure before and after ophthalmic surgery, and as an adjunct in the management of acute glaucoma (p.1873). Its onset of action is rapid, with a maximal reduction in intra-ocular pressure occurring about 1 to 1⁄ hours after a dose; the duration of action is about 5 hours. The usual initial dose of glycerol is 1 to 1.8 g/kg given as a 50% solution. There can be problems of palatability when glycerol solutions are given orally; chilling or flavouring the solutions may help.

Glycerol may be applied topically to reduce corneal oedema, but as the effect is only transient its use is largely limited to an adjunct in eye examination and diagnosis. Glycerol eye drops can be painful on instillation and use of a local anaesthetic beforehand has been recommended.

Glycerol has also been given orally or intravenously to reduce intracranial pressure (see below).

Glycerol may be used rectally as suppositories or a solution in single doses to promote faecal evacuation in the management of constipation (p.1693). It usually acts within 15 to 30 minutes. Glycerol is commonly classified as an osmotic laxative but may act additionally or alternatively through its local irritant effects; it may also have lubricating and faecal softening actions.

Glycerol is used as a demulcent in cough preparations (p.1547).

Glycerol has many applications in pharmaceutical formulation; these include its use as a vehicle and solvent, as a sweetening agent, as a preservative in some liquid medications, as a plasticiser in tablet film-coating, and as a tonicity adjuster. It is often included in topical preparations such as eye drops, creams, and lotions as a lubricant and also for its moisturising properties since, when absorbed, its hygroscopic action can enhance moisture retention. Ear drops for the removal of ear wax often contain glycerol as a lubricating and softening agent.

Glycerol is also used as a cryoprotectant in cryopreservation.

Diagnosis of Ménière's disease. Glycerol has been used[1] in the diagnosis of Ménière's disease (p.564) to distinguish potentially reversible cochlear dysfunction from the relatively irreversible pathology of advanced disease, or to predict the results of endolymphatic sac surgery. Glycerol is given by mouth to reduce the endolymphatic fluid volume and pressure and any transient improvement in hearing is measured. However, the adverse effects of glycerol such as headache, nausea, and vomiting can be a problem and the test has been reported to have low sensitivity and to give false-positive results. See also under Effects on the Ears, above.

1. Skalabrin TA, Mangham CA. Analysis of the glycerin test for Meniere's disease. *Otolaryngol Head Neck Surg* 1987; **96:** 282–8.

Raised intracranial pressure. Glycerol has been given intravenously or by mouth for its osmotic diuretic effect to reduce cerebral oedema and hence decrease the intracranial pressure (p.1181). It is also reported to be able to increase blood flow to areas of brain ischaemia. It has been used in a variety of clinical conditions[1] including cerebral infarction or stroke,[2] Reye's syndrome,[3] and meningitis.[4,5] It has been postulated[5] that glycerol's beneficial action in preventing the neurological sequelae in bacterial meningitis is due to its effects in increasing cerebral plasma osmolality, which reduces cerebral oedema and enhances cerebral circulation by reducing the excretion of cerebrospinal fluid, and that this may be more important than the decrease in intracranial pressure induced by osmotic diuresis. Glycerol has been reported to be ineffective in hepatic coma.[6] Some patients have had serious adverse effects including haemolysis, haemoglobinuria, and renal failure.[7,8]

Trigeminal neuralgia. Selective destruction of pain-bearing nerves is reserved for patients who do not respond to conventional drug therapy for trigeminal neuralgia (p.9). This may be achieved by the instillation of glycerol among the trigeminal rootlets (percutaneous retrogasserian glycerol rhizolysis).[1-5] The efficacy and safety of this procedure have been debated,[1,4] but some centres report good long-term results in the majority of patients.[5] It has been suggested that variations in viscosity and osmolality may influence results.[2]

Glyceryl Palmitostearate

Glicerol, palmitoestearato de. A mixture of mono-, di-, and triglycerides of C_{16} and C_{18} fatty acids.

CAS — 8067-32-1.

Profile

Glyceryl palmitostearate is used in pharmaceutical manufacturing as a diluent and lubricant for tablets and capsules.

Glycopyrronium Bromide *(BAN, rINN)*

AHR-504; Bromuro de glicopirronio; Glikopironyum Bromür; Glycopyrrolate *(USAN)*; Glycopyrronii bromidum; Glycopyrronium, bromure de; Glykopyrroniumbromid; Glykopyrronium-bromidi. 3-(α-Cyclopentylmandeloyloxy)-1,1-dimethylpyrrolidinium bromide.

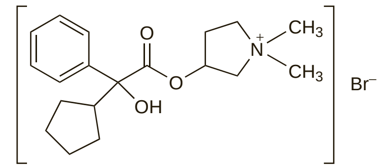
Гликопиррония Бромид

$C_{19}H_{28}BrNO_3 = 398.3.$

CAS — 596-51-0.

ATC — A03AB02.

ATC Vet — QA03AB02.



Pharmacopoeias. In *Chin.* and *US.*

USP 31 (Glycopyrrolate). A white, odourless, crystalline powder. Soluble 1 in 4.2 of water, 1 in 30 of alcohol, 1 in 260 of chloroform, and 1 in 35 000 of ether. Store in airtight containers.

Incompatibility. Glycopyrronium bromide is incompatible with alkalis.

Stability. Investigation of the compatibility of glycopyrronium bromide with infusion solutions and additives showed that the stability of glycopyrronium bromide is questionable above a pH of 6, owing to ester hydrolysis.[1]

1. Ingallinera TS, *et al.* Compatibility of glycopyrrolate injection with commonly used infusion solutions and additives. *Am J Hosp Pharm* 1979; **36:** 508–10. Correction. *ibid.*; 745.

Adverse Effects, Treatment, and Precautions

As for Atropine Sulfate, p.1219.

Renal impairment. A comparison[1] of the pharmacokinetics of intravenous glycopyrronium in 11 uraemic and 7 control patients indicated that the renal elimination of glycopyrronium is considerably prolonged in patients with uraemia. The mean amount of a dose excreted in the urine within 3 hours of a dose was 0.7% in the uraemic patients and 50% in the control patients; 24-hour excretion was 7% and 65%, respectively. The authors concluded that repeated or large doses of glycopyrronium should be avoided or perhaps the drug should not be used in patients with uraemia.

1. Kirvelä M, *et al.* Pharmacokinetics of glycopyrronium in uraemic patients. *Br J Anaesth* 1993; **71:** 437–9.

Interactions

As for Atropine Sulfate, p.1220.

Pharmacokinetics

Glycopyrronium bromide is poorly absorbed from the gastrointestinal tract; about 10 to 25% is absorbed after an oral dose. Glycopyrronium bromide penetrates the blood-brain barrier only poorly. Glycopyrronium is excreted in bile and urine.

Uses and Administration

Glycopyrronium bromide is a quaternary ammonium antimuscarinic with peripheral effects similar to those of atropine (p.1219). After intramuscular doses, onset of effects is within 15 to 30 minutes; vagal blocking effects last for 2 to 3 hours and antisialagogue effects persist for up to 7 hours. After intravenous doses, onset of actions occurs within 1 minute.

Glycopyrronium bromide is used similarly to atropine in anaesthetic practice. It has also been used in the iontophoretic treatment of hyperhidrosis and as an adjunct in the treatment of peptic ulcer disease. It is also under investigation for the treatment of chronic moderate to severe drooling in children.

See under headings below for details of dosage in specific indications.

Anaesthesia. Glycopyrronium bromide is given as a premedicant before general anaesthesia (see under Atropine, p.1221) to diminish the risk of vagal inhibition of the heart and to reduce salivary and bronchial secretions. It is given in doses of 200 to 400 micrograms intravenously or intramuscularly before the induction of anaesthesia; alternatively, it may be given in a dose of 4 to 5 micrograms/kg to a maximum of 400 micrograms. If necessary, similar or lower doses may be given intravenously during the operation and repeated if required. A suggested dosage for premedication in neonates is 5 micrograms/kg given intravenously or intramuscularly; doses in children aged 1 month and over are 4 to 8 micrograms/kg up to a maximum of 200 micrograms.

Glycopyrronium bromide is given before or with anticholinesterases to counteract their muscarinic effects when they are used to reverse the effects of competitive muscle relaxants (see Neostigmine, p.632). The dose is glycopyrronium bromide 200 micrograms intravenously per 1 mg of neostigmine (or per 5 mg of pyridostigmine); alternatively, it may be given in a dose of 10 to 15 micrograms/kg intravenously with neostigmine 50 micrograms/kg. A suggested dosage for neonates and children is 10 micrograms/kg intravenously with neostigmine 50 micrograms/kg. Glycopyrronium bromide can be given mixed in the same syringe with the anticholinesterase, and it has been suggested that greater cardiovascular stability results from use in this way.

Gastrointestinal disorders. Antimuscarinics, including glycopyrronium bromide, have a limited role as antispasmodics (see p.1692), and have been used as adjuncts in the treatment of peptic ulcer disease (see p.1702).

As an adjunct in the treatment of peptic ulcer disease the usual initial dose of glycopyrronium bromide has been 3 to 6 mg daily by mouth in divided doses adjusted according to response to a maximum of 8 mg daily; a maintenance dose of 1 mg twice daily is often adequate. Doses of 100 to 200 micrograms have been given by intramuscular or intravenous injection.

Hyperhidrosis. Adverse effects generally preclude oral use of antimuscarinics for the management of hyperhidrosis (p.1580), but glycopyrronium, has been applied topically as an alternative to aluminium salts.

In studies involving 22 patients with the Frey syndrome (localised flushing and sweating on eating) glycopyrronium bromide as 1 and 2% cream or roll-on solution gave good control of symptoms;[1] patients tended to prefer the roll-on lotion as it was easier to apply. Topical hyoscine as 0.25, 1, or 3% solution or cream also gave control of sweating, but was associated with a much higher incidence of adverse effects. Patients with diabetic gustatory sweating have also noted a reduction in the frequency and severity of episodes after applying glycopyrronium 0.5% cream.[2]

Glycopyrronium bromide has also been used as a 0.05% solution in the iontophoretic treatment of hyperhidrosis.

2. Shaw JE, *et al.* A randomised controlled trial of topical glycopyrrolate, the first specific treatment for diabetic gustatory sweating. *Diabetologia* 1997; **40:** 299–301.

Palliative care. Glycopyrronium bromide is used in palliative care as an alternative to hyoscine to reduce excessive respiratory secretions. A dose of 200 micrograms may be given subcutaneously or intramuscularly every 4 hours. Alternatively, a dose of 0.6 to 1.2 mg may be given by continuous subcutaneous infusion over 24 hours.

Respiratory-tract disorders. Antimuscarinics have potent bronchodilatory activity and some, such as ipratropium (p.1124), may be used in the management of reversible airways obstruction. Glycopyrronium has been studied, although it is not one of the preferred drugs.

Glycyrrhizic Acid

Glycyrrhizin; Glycyrrhizinic Acid.

$C_{42}H_{62}O_{16}$ = 822.9.

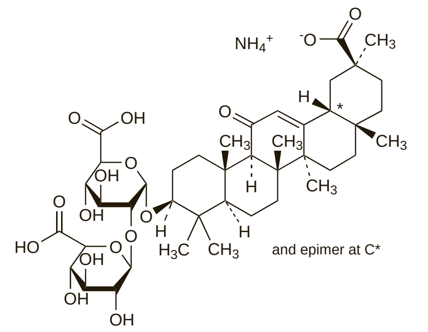
CAS — 1405-86-3.

Ammonium Glycyrrhizate

Ammonii glycyrrhizas; Ammonium, glycyrrhizate d'; Ammonium Glycyrrhizinate; Ammónium-glicirrizát; Ammoniumglycyrrhizat; Ammoniumglykyrritsaatti; Amonio glicirizatas; Amonium-glycyrrhizát; Glycyrram; Monoammonium Glycyrrhizinate.

$C_{42}H_{65}NO_{16}$ = 840.0.

CAS — 53956-04-0.



Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Ammonium Glycyrrhizate). A white or yellowish-white, hygroscopic powder. Slightly soluble in water; very slightly soluble in alcohol; practically insoluble in acetone. It dissolves in dilute solutions of acids and of alkali hydroxides. Store in airtight containers.

Dipotassium Glycyrrhizate

Potassium Glycyrrhizinate.

$C_{42}H_{60}K_2O_{16}$ = 899.1.

CAS — 68039-19-0 (potassium glycyrrhizate); 42294-03-1 (monopotassium glycyrrhizate); 68797-35-3 (dipotassium glycyrrhizate);.

Profile

Glycyrrhizic acid is a constituent of liquorice (p.1740). The mild anti-inflammatory and mineralocorticoid properties of liquorice have been attributed to the presence of glycyrrhizic acid and its metabolite glycyrrhetinic acid (Enoxolone, p.50).

Glycyrrhizic acid and its ammonium and potassium salts have been used in products promoted for the relief of coughs, viral infections, and gastrointestinal, liver, and skin disorders. Ammonium glycyrrhizate has also been used as a sweetener, flavour enhancer, and as an emulsifying and gel-forming agent in foodstuffs and cosmetics.

Other derivatives of glycyrrhizic acid discussed elsewhere include metoclopramide glycyrrhizinate (p.1749) and enoxolone (p.50).

Preparations

Proprietary Preparations (details are given in Part 3)

Arg.: Epigen; ***Indon.:*** Neo-Minophagen C; ***Jpn:*** Neo-Minophagen C; ***Mex.:*** Epigen; ***Rus.:*** Epigen (Эпиген).

Multi-ingredient: ***Austria:*** Enicul; ***Fr.:*** Keracnyl stop bouton; Topialyse Fluide; Topialyse Plus; ***Ital.:*** Biothymus DS; ***Jpn:*** Colgen Kowa Bien Soft Mini; ***Mex.:*** Bexident Pediatrics†; ***Port.:*** Alkagin; Bexident.

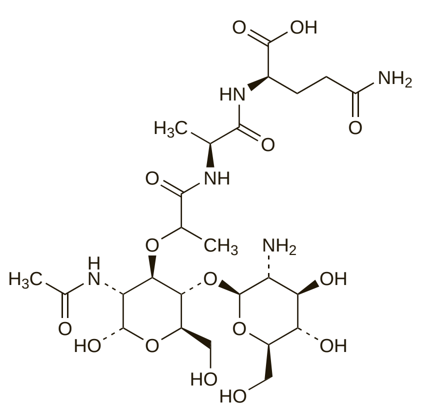
GMDP

Glucosaminylmuramyl Dipeptide. *N*-acetylglucosaminyl-β1-4-*N*-acetylmuramyl-alanyl-D-isoglutamine.

ГМДП

$C_{25}H_{43}N_5O_{15}$ = 653.6.

CAS — 97590-38-0.



Profile

GMDP, a component of bacterial cell walls, is reported to have immunomodulator properties and is used in a wide range of diseases stated to be associated with secondary immunodeficiency.

Preparations

Proprietary Preparations (details are given in Part 3)

Rus.: Licopid (Ликопид).

Gold

Aurum; E175; Or; Oro.

Au = 196.966569.

CAS — 7440-57-5.

Profile

Gold is a bright-yellow, malleable, and ductile metal; the finely divided powder may be black, ruby, or purple. The main use of metallic gold in health care is now in dentistry. Gold may also be used as a colouring agent for some foodstuffs. In the treatment of rheumatoid arthritis, gold is used in the form of compounds such as auranofin (p.25), aurothioglucose (p.26), and sodium aurothiomalate (p.122). The radionuclide gold-198 is described in the chapter on radiopharmaceuticals (p.2053). There have been rare reports of hypersensitivity reactions to metallic gold.

Homoeopathy. Gold has been used in homoeopathic medicines under the following names: Aurum; Aurum met.; Aurum metallicum; Aur. met.

Preparations

Proprietary Preparations (details are given in Part 3)

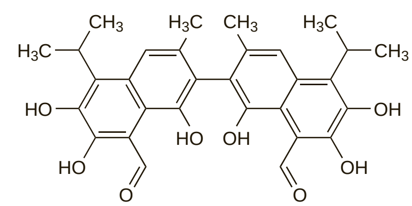
Multi-ingredient: ***Ger.:*** Cefassin†.

Gossypol

Gosipol. 2,2′-Bis(1,6,7-trihydroxy-3-methyl-5-isopropylnaphthalene-8-carboxaldehyde).

$C_{30}H_{30}O_8$ = 518.6.

CAS — 303-45-7.



Profile

Gossypol is a pigment extracted from cottonseed oil (p.2288). It possesses antispermatogenic activity and has been studied, especially in China, as a male contraceptive. It has also been investigated for its antineoplastic, antiprotozoal, antiviral, and spermicidal activity and has been studied in women in the treatment of gynaecological disorders.

Adverse effects have included fatigue, changes in appetite, gastrointestinal effects, burning sensation of the face and hands, some loss of libido, and persistent oligospermia. Hypokalaemia has occurred.

◊ The pharmacology and therapeutic potential of gossypol have been reviewed.[1] Although controlled studies[2,3] have shown gossypol to be an effective male contraceptive, WHO concluded[4] that gossypol would not be acceptable as a male antifertility drug because of the occurrence of adverse effects such as hypokalaemia and irreversible testicular damage resulting in azoospermia or severe oligozoospermia.

Grape

Grapevine; Rebe; Vigne Rouge; Weinstock.

NOTE. Distinguish from grape bark, Cocillana, p.1554.

Pharmacopoeias. *Fr.* includes Red Vine Extract (Extrait de Vigne Rouge (Sec)), prepared from the leaves.

Profile

The seeds and the leaves of the grape, *Vitis vinifera* (Vitaceae), are used in herbal medicine. The dried fruit (raisins) have laxative and demulcent properties.

Many parts of the plant including the fruit skin, seeds, and leaves are used. Both dietary sources and various extracts are promoted for their antioxidant properties in venous insufficiency and capillary impairment, and it has been suggested that they may protect against atherosclerosis.

A standardised red vine leaf extract (AS-195) has been given for the management of chronic venous insufficiency.

Grape seed and grape seed extracts have been included in preparations for peripheral vascular disorders and venous insufficiency and for prophylaxis of cardiovascular disorders. Extracts of grape seed proanthocyanidins, including IH636, are being investigated for a range of other disorders in which antioxidant and free-radical scavenging activity is thought to be beneficial, including cancer prevention, hepatic disorders, radiation-induced fibrosis, cataracts, and macular degeneration, although there is currently little evidence of effectiveness.

Resveratrol, a compound present in grapes, (see p.2378) is also promoted as an antoxidant.

Grape seed oil is included in topical preparations.

The fresh and dried fruits of the grape and the leaves are used as foodstuffs.

◊ Review.

Ph. Eur. 6.2 (Greater Celandine). The dried, whole, or cut aerial parts of *Chelidonium majus* collected during flowering. It contains a minimum of 0.6% of total alkaloids expressed as chelidonine ($C_{20}H_{19}NO_5$ = 353.4), calculated with reference to the dried drug.

Profile

Greater celandine has sedative and spasmolytic properties and the aerial parts are used for liver, biliary, and gastrointestinal disorders, and have also been used for respiratory-tract disorders. The latex has been used externally for warts and other skin conditions.

It has been reported to cause hepatotoxicity.

Homoeopathy. Greater celandine has been used in homoeopathic medicines under the following names: Chelidonium; Chelidonium majus; Chelidonium, Flos; Chelidonium majus e floribus; Che. maj.

Effects on the liver. References.

Green-lipped Mussel

Extracto de mejillón de labios verdes.

Зеленого Губчатого Моллюска

Profile

An extract from the green-lipped mussel *Perna canaliculus* (Mytilidae), stated to contain omega-3 polyunsaturated fatty acids, amino acids, fats, carbohydrates, and minerals, has been promoted for the treatment of rheumatic disorders including rheumatoid arthritis (p.11). It has also been tried in asthma.

Rheumatic disorders. Reviews of the investigation of green-lipped mussel in the treatment of arthritis have not revealed conclusive evidence of its usefulness.[1,2]

Multi-ingredient: ***Austral.:*** Prost-1†; ***Ital.:*** Osteoclar; ***UK:*** Healtheries Musseltone & Glucosamine.

Griffonia Simplicifolia

Profile

The leaf, stem, and twigs of *Griffonia simplicifolia* (Fabaceae) have been used for a variety of disorders in its native West Africa. It is included in herbal and nutritional supplements. It is a source of lectins and has insecticidal properties.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Fr.:*** Prosatietil†; Tryptonat; ***Ital.:*** Brioplus; Calmason; Climil Complex.

Grindelia

Gum Plant; Gumweed; Tar Weed.

Pharmacopoeias. In *Fr.* which allows *Grindelia camporum*, *G. humilis*, *G. robusta*, and *G. squarrosa*.

Profile

Various *Grindelia* spp. (Asteraceae) have been included in herbal preparations used for respiratory-tract disorders.

Homoeopathy. Grindelia has been used in homoeopathic medicines under the following names: Grindelia robusta; Grind. ro.

Preparations

Proprietary Preparations (details are given in Part 3)

Ground Ivy

Ale-hoof; Gundelrebe; Gundermann; Hiedra terrestre; Lierre Terrestre.

Pharmacopoeias. In *Chin.* and *Fr.*

Profile

Ground ivy, the aerial parts of *Glechoma hederacea* (*Nepeta hederacea*) (Labiatae) has been used for respiratory-tract and gastrointestinal disorders.

Homoeopathy. Ground ivy has been used in homoeopathic medicines.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** Gerard House Water Relief Tablets; Water Naturtabs.

Guaiacum Resin

Guaiac; Guaiacum; Guajakharz; Gwajakowa żywica; Resina de guayaco.

CAS — 9000-29-7.

Profile

Guaiacum resin is obtained from guaiacum wood (lignum vitae; *Guaiacum officinale* or *G. sanctum*) (Zygophyllaceae) and has been used in the treatment of rheumatism. It is used in herbal medicine.

Guaiacum resin is used in the detection of occult blood in the faeces. The accuracy of the guaiacum test has been questioned and some drugs may interfere with the result.

Homoeopathy. Guaiacum resin has been used in homoeopathic medicines under the following names: Guaiacum; Guajacum; Guaic.

◊ References.

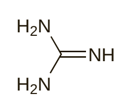
Guanidine Hydrochloride

Carbamidine Hydrochloride; Guanidina, hidrocloruro de; Guanidyny chlorowodorek; Iminourea Hydrochloride.

CH_5N_3,HCl = 95.53.

CAS — 113-00-8 (guanidine); 50-01-1 (guanidine hydrochloride).



(guanidine)

Profile

Guanidine hydrochloride enhances the release of acetylcholine from nerve terminals. It has been given by mouth to reverse neuromuscular blockade in patients with botulism (p.2207), but its efficacy has not been established. Guanidine hydrochloride has also been tried in Eaton-Lambert myasthenic syndrome (p.629)

and other neurological disorders, but its use has been associated with bone-marrow suppression in some patients.

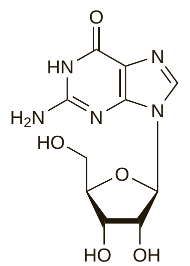
Guanosine

Guanine Riboside; NSC-19994; Vernine. 2-Amino-9-β-D-ribofuranosyl-9*H*-purin-6(1*H*)-one.

Гуанозин

$C_{10}H_{13}N_5O_5$ = 283.2.

CAS — 118-00-3.



Profile

Guanosine is an endogenous guanine nucleoside involved in many biological processes; it is one of the components of nucleic acids (p.2355). Guanosine is included in preparations for peripheral and cerebral vascular disorders and myopathies; guanosine monophosphate has been used similarly.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Cz.:*** Laevadosin†; ***Spain:*** Nutracel.

Gutta Percha

Gummi Plasticum; Gutapercha; Gutt. Perch.

Pharmacopoeias. In *US.*

USP 31 (Gutta Percha). The coagulated, dried, purified latex of the trees of the genera *Palaquium* and *Payena* and most commonly *Palaquium gutta* (Sapotaceae). It occurs in lumps or blocks of variable size; externally brown or greyish-brown to greyish-white in colour; internally reddish-yellow or reddish-grey and having a laminated or fibrous appearance. It is flexible but only slightly elastic. Has a slight, characteristic odour. Insoluble in water; partly soluble in carbon disulfide, in turpentine oil, and in benzene; about 90% soluble in chloroform. Store under water. Protect from light.

Profile

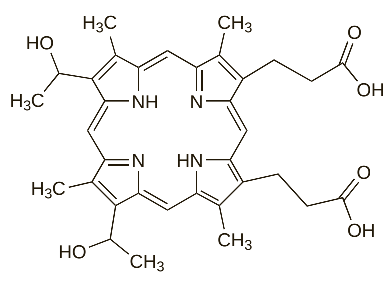
Gutta percha has been used in various dressings. In dentistry, gutta percha has been used as a filling material and as the basis of compounds for taking dental impressions.

Haematoporphyrin

Hematoporfirina.

$C_{34}H_{38}N_4O_6$ = 598.7.

CAS — 14459-29-1.



Profile

Haematoporphyrin is a red pigment, free from iron, obtained from haematin. It is an ingredient of preparations promoted as tonics, particularly for the elderly, and has been used in the treatment of depression. Derivatives of haematoporphyrin are used as photosensitisers in the photodynamic therapy of malignant neoplasms (see Porfimer Sodium, p.764).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** KH3; ***Chile:*** Actebral; KH3-Vit†; KH3†; ***Ger.:*** KH3†; Revicain comp plus†; ***Hong Kong:*** KH3; ***Ital.:*** Porfirin 12; Tonogen; Vit-Porphyrin†; ***NZ:*** KH3; ***Thai.:*** KH3.

Hamamelis

Amamelide; Csodamogyorólevél (hamamelis leaf); Hamamelidis; Hamamelidis folium (hamamelis leaf); Hamameliksenlehti (hamamelis leaf); Hamamélis de virginie; Hamamélis, feuille d' (hamamelis leaf); Hamamelisblad (hamamelis leaf); Hamamelių lapai (hamamelis leaf); Trollhassel; Vilínový list (hamamelis leaf); Virginsk Troldnød; Witch Hazel; Zauberhasel; Zaubernuss.

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Hamamelis Leaf). The whole or cut dried leaves of *Hamamelis virginiana* containing not less than 3% tannins, expressed as pyrogallol ($C_6H_6O_3$ = 126.1), calculated with reference to the dried drug. Protect from light.

USP 31 (Witch Hazel). A clear, colourless distillate prepared from recently cut and partially dried dormant twigs of *Hamamelis virginiana*. pH between 3.0 and 5.0. Store in airtight containers at a temperature not exceeding 40°.

Profile

Hamamelis has astringent properties and contains gallic acid, a bitter principle, and a trace of volatile oil. It is used in preparations for the symptomatic relief of haemorrhoids (p.1697). Hamamelis water is used as a cooling application and has been applied as a haemostatic.

Hamamelis is used in herbal preparations for a variety of disorders.

Homoeopathy. Hamamelis has been used in homoeopathic medicines under the following names: Hamamelis virginiana; Hamamelis, Folium; Hamamelis virginiana e foliis; Hamamelis virginiana ex cortice summitatibusque; Hamamelis virginica; Ham. virg.

Preparations

USP 31: Witch Hazel.

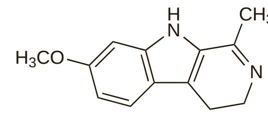
Harmaline

Harmalina. 3,4-Dihydroharmine.

$C_{13}H_{14}N_2O$ = 214.3.

CAS — 304-21-2.



Description. Harmaline is an alkaloid obtained from peganum, the dried seeds of *Peganum harmala* (Zygophyllaceae).

The following terms have been used as 'street names' (see p.vi) or slang names for various forms of harmaline or preparations containing harmaline:

Caapi; Huasca; Purga, la; Vine; Yage.

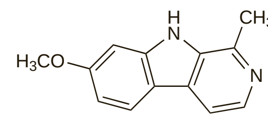
Harmine

Harmina; 7-Methoxy-1-methyl-9*H*-pyrido[3,4-*b*]indole.

Хармин

$C_{13}H_{12}N_2O$ = 212.2.

CAS — 442-51-3.



Description. Harmine is an alkaloid obtained from peganum, the dried seeds of *Peganum harmala* (Zygophyllaceae), also known as syrian rue.

Harmine is identical with an alkaloid known as banisterine or telepathine obtained from *Banisteriopsis caapi* (Malpighiaceae).

The following terms have been used as 'street names' (see p.vi) or slang names for various forms of harmine or preparations containing harmine:

Rue.

Profile

Harmine and harmaline are the main active principles of a hallucinogenic drink, known in South American regions as 'ayahuasca', 'caapi', or 'yagé', that is made from closely related plants of the family Malpighiaceae. They have no therapeutic use.

Helonias

Blazing Star; Chamaelirium; False Unicorn; Starwort.

Profile

Helonias is the root of *Chamaelirium luteum* (*Helonias dioica*) (Liliaceae). It is used in herbal medicine particularly for gynaecological disorders.

Homoeopathy. Helonias has been used in homoeopathic medicines under the following names: Chamaelirium luteum; Helonias dioica; Helon.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Capsella Complex; Nervatona Calm; Nervatona Focus; ***UK:*** Period Pain Relief.

Henna

Henna Leaf; Henné; Lawsonia.

Profile

Henna is the dried leaves of *Lawsonia inermis* (*L. alba*) (Lythraceae), containing lawsone (p.2331). Powdered henna is used for dyeing the hair, skin, and nails.

Adverse effects. Allergic skin reactions to henna used to dye the skin have been reported.[1] Such reactions were usually due to additives used to shorten the application time of the dye and allergic reactions to 'plain' henna were rare. Similar reactions have been reported[2-10] after henna tattoos on the skin. The adulterant, which is added to natural henna to darken it ('black henna'), was identified[2,5] as paraphenylenediamine (p.2363). There have been reports of the paraphenylenediamine adulterant producing permanent skin pigment changes[7,10] and also cross-sensitisation to paraphenylenediamine-containing hair dyes[7-10] and textile dyes;[10] there is also the possibility of sensitisation to other allergens such as natural rubber latex.[10]

The suggestion that henna may cause neonatal hyperbilirubinaemia is discussed under Lawsone, p.2331.

Heptaminol Hydrochloride *(BANM, rINNM)* ⊗

Heptaminol, Chlorhydrate d'; Heptaminol, chlorhydrate de; Heptaminol hydrochlorid; Heptaminol-hidroklorid; Heptaminolhydroklorid; Heptaminoli hydrochloridum; Heptaminolihydrokloridi; Heptaminolio hidrochloridas; Hidrocloruro de heptaminol; RP-2831. 6-Amino-2-methylheptan-2-ol hydrochloride.

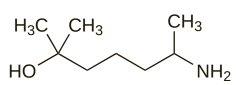
Гептаминола Гидрохлорид

$C_8H_{19}NO,HCl = 181.7.$

CAS — 372-66-7 (heptaminol); 543-15-7 (heptaminol hydrochloride).

ATC — C01DX08.

ATC Vet — QC01DX08.



(heptaminol)

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Heptaminol Hydrochloride). A white or almost white crystalline powder. Freely soluble in water; soluble in alcohol; practically insoluble in dichloromethane.

Profile

Heptaminol hydrochloride is a cardiac stimulant and vasodilator and has been given in the treatment of cardiovascular disorders. Heptaminol and heptaminol adenosine phosphate have also been used.

Preparations

Proprietary Preparations (details are given in Part 3)

Fr.: Ampecyclal; Hept-A-Myl; ***Indon.:*** Hept-a-myl; ***Ital.:*** Coreptil†.

Multi-ingredient: ***Arg.:*** Flebitol; ***Cz.:*** Ginkor Fort; ***Fr.:*** Debrumyl; Ginkor Fort; ***Ger.:*** Normotin-R†; Perivar†; Veno-Tebonin N†; ***Hong Kong:*** Ginkor Fort; ***Hung.:*** Ginkor Fort; ***Malaysia:*** Ginkor Fort; ***Port.:*** Debrumyl; Forticol; ***Rus.:*** Ginkor Fort (Гинкор Форт); ***Spain:*** Denubil; Largatrex†; ***Thai.:*** Ginkor Fort.

Herniaria

Bruchkraut; Herba Herniariae; Herniary; Rupturewort; Rupturewort.

Profile

Herniaria consists of the dried leaves and flowering tops of various species of rupture-wort, chiefly *Herniaria glabra* and *H. hirsuta* (Caryophyllaceae). It has astringent and diuretic properties and has been given in urinary-tract disorders.

Homoeopathy. Herniaria has been used in homoeopathic medicines under the following names: Herniaria glabra; Hern. gla.

Preparations

Proprietary Preparations (details are given in Part 3)

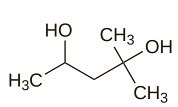
Multi-ingredient: ***Austria:*** Blasentee St Severin; Uropurat; ***Cz.:*** Urologicka Cajova Smes.

Hexylene Glycol

Hexilenglicol. 2-Methyl-2,4-pentanediol.

$C_6H_{14}O_2 = 118.2.$

CAS — 107-41-5.



Pharmacopoeias. In *USNF.*

USNF 26 (Hexylene Glycol). A clear, colourless, viscous liquid. Absorbs moisture when exposed to moist air. Miscible with water and with many organic solvents including alcohol, acetone, chloroform, ether, and hexanes. Store in airtight containers.

Profile

Hexylene glycol has properties similar to those of propylene glycol (p.2374). It is used as a pharmaceutical aid.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***USA:*** Bodi Kleen.

Hibiscus

Guinea Sorrel; Hibisci Flos (flowers); Hibisci Sabdariffae Flos (flowers); Hibiscusblüten (flowers); Jamaica Sorrel; Jamaikinių hibiskų žiedai (flowers); Karkadé; Květ ibišku sudánského (flowers); Oseille de Guinée; Red Sorrel; Rosella; Rosellenkukka (flowers) ; Rosellhibiskusblomma (flowers); Rozella (flowers).

Гибискус Сабдарифа; Кислица Ямайская

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Roselle; Hibisci Sabdariffae Flos). The whole or cut dried calyces and epicalyces of *Hibiscus sabdariffa* collected during fruiting.

Profile

Hibiscus is a large genus of flowering plants in the Malvaceae family. The flowers of roselle, *Hibiscus sabdariffa*, are included in herbal preparations for loss of appetite and a range of disorders of the upper respiratory and gastrointestinal tracts.

Culinary uses of *H. sabdariffa* include hibiscus tea, a refreshing caffeine-free beverage made from the flowers.

Homoeopathy. *Hibiscus sabdariffa* has been used in homoeopathic medicines under the following names: Sabdariffa.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Fr.:*** Calmophytum; Hydracur.

Histamine

Histamiini; Histamin; Histamina; Histaminum. 2-(Imidazol-4-yl)ethylamine.

$C_5H_9N_3,2H_3PO_4,H_2O = 325.2.$

CAS — 51-74-1 (anhydrous histamine phosphate).

ATC — V04CG03.

ATC Vet — QV04CG03.

Pharmacopoeias. In *Eur.* (see p.vii). *Chin.* and *US* specify the anhydrous substance.

Ph. Eur. 6.2 (Histamine Phosphate). Colourless, long prismatic crystals. Freely soluble in water; slightly soluble in alcohol. A 5% solution in water has a pH of 3.75 to 3.95. Protect from light.

USP 31 (Histamine Phosphate). Anhydrous histamine phosphate occurs as colourless, odourless, long prismatic crystals. Is stable in air but is affected by light. Soluble 1 in 4 of water. Its solutions are acid to litmus. Store in airtight containers. Protect from light.

Stability. A study concluded that solutions of histamine phosphate could be sterilised by heating in an autoclave with little degradation.[1] Autoclaved solutions could be stored for a minimum of 4 months.

1. McDonald C, *et al.* Stability of solutions of histamine acid phosphate after sterilization by heating in an autoclave. *J Clin Pharm Ther* 1990; **15:** 41–4.

Adverse Effects and Treatment

Injection of histamine salts can produce adverse effects including headache, flushing of the skin, general vasodilatation with a fall in blood pressure, tachycardia, bronchial constriction and dyspnoea, visual disturbances, vomiting, diarrhoea, and other gastrointestinal effects. These reactions can be severe; excessive dosage can produce collapse and shock, and may be fatal. Reactions may occur at the injection site.

Some of these effects may be relieved by an antihistamine, but adrenaline may be required and should always be available.

Precautions

Histamine salts should be used with care in patients with asthma or other hypersensitivity disorders, in elderly patients, and in patients with cardiovascular disorders.

Pharmacokinetics

Histamine salts exert a rapid, though transient, effect when given parenterally. Histamine is rapidly metabolised by methylation and oxidation; the metabolites are excreted in the urine.

◊ References.

1. Middleton M, *et al.* Pharmacokinetics of histamine dihydrochloride in healthy volunteers and cancer patients: implications for combined immunotherapy with interleukin-2. *J Clin Pharmacol* 2002; **42:** 774–81.

Uses and Administration

Histamine causes stimulation of smooth muscle, especially of the bronchioles, and lowers blood pressure by dilating the arterioles and capillaries. It also stimulates exocrine gland secretion, especially the gastric glands.

Intradermal injection of histamine produces the characteristic 'triple response' of erythema, flare, and wheal. This is utilised as a control response in skin testing for hypersensitivity. Also, since it is mediated in part by axon reflexes, it has been used to test the integrity of sensory nerves, for example in leprosy.

Inhalation of histamine causes bronchoconstriction and is used as a test of bronchial reactivity.

Histamine has also been given subcutaneously to identify the causes of achlorhydria and intravenously in the diagnosis of phaeochromocytoma, but safer tests are generally preferred.

Histamine is included in some combination topical preparations for musculoskeletal disorders.

Histamine hydrochloride is under investigation as an adjunct in the management of acute myeloid leukaemia and malignant melanoma. It has also been tried as an adjunct to interferons and other drugs in the management of hepatitis C.

Histoplasmin

Histoplasmina.

Pharmacopoeias. In *US.*

USP 31 (Histoplasmin). A clear, colourless, sterile solution containing standardised culture filtrates of *Histoplasma capsulatum* grown on liquid synthetic medium. It may contain a suitable antimicrobial. Store at 2° to 8°. The expiry date is not later than 2 years after release from the manufacturer's cold storage.

Profile

Histoplasmin, in an intradermal (intracutaneous) dose of 0.1 mL of a 1 in 100 dilution, may be used as an aid to the diagnosis of histoplasmosis. However, the diagnostic value of the test has been questioned and it may interfere with serological tests for histoplasmosis.

Histoplasmin has also been used, in conjunction with other antigens, to assess cell-mediated immunity.

Preparations

USP 31: Histoplasmin.

Proprietary Preparations (details are given in Part 3)

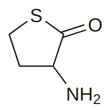
USA: Histolyn-CYL.

Homocysteine Thiolactone Hydrochloride

3-Aminodihydro-2(3*H*)-thiophenone hydrochloride.

$C_4H_8ClNOS = 153.6$.

CAS — 10593-85-8 (homocysteine thiolactone); 3622-59-1 (homocysteine thiolactone hydrochloride).



(homocysteine thiolactone)

Profile

Homocysteine thiolactone has been used in preparations for the treatment of liver disorders. Its hydrochloride salt has been used as a mucolytic. Homocysteine thiolactone is a metabolite of homocysteine and has been implicated in the pathogenesis of some cardiovascular diseases (see p.1941).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Braz.:*** Filogaster†.

Horseradish

Armoracia; Meerrettich; Rábano rusticano; Raifort.

Profile

Horseradish, the root of *Cochlearia armoracia* (*Armoracia rusticana*; *Nasturtium armoracia*; *Radicula armoracia*) (Cruciferae), has diuretic and antiseptic properties and stimulates the digestion. It is used in gastrointestinal, respiratory-tract, and urinary-tract disorders, and has also been used externally.

Horseradish is widely used as a food flavouring and condiment.

Homoeopathy. Horseradish has been used in homoeopathic medicines under the following names: Cochlearia armoracia; Coch. ar.

Hyaluronic Acid *(BAN)*

Hialurónico, ácido. (1→3)-*O*-(2-Acetamido-2-deoxy-β-D-glucopyranosyl)-(1→4)-*O*-β-D-glucopyranosiduronan.

CAS — 9004-61-9.

ATC — D03AX05; M09AX01; S01KA01.

ATC Vet — QD03AX05; QM09AX01; QS01KA01.

NOTE. The term Hyaluronan is used to cover both hyaluronic acid and sodium hyaluronate.

Sodium Hyaluronate *(BANM)*

Hialuronato sódico; Hyaluronate Sodium *(USAN)*; Natrii hyaluronas; Natrio hialuronatas; Nátrium-hialuronát; Natriumhyaluronaatti; Natriumhyaluronat; Natrium-hyaluronát; Sodium, hyaluronate de; Sodyum Hiyalüronat.

CAS — 9067-32-7.

ATC — D03AX05; M09AX01; S01KA01.

ATC Vet — QD03AX05; QM09AX01; QS01KA01.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Sodium Hyaluronate). The sodium salt of hyaluronic acid, a glycosaminoglycan consisting of D-glucuronic acid and *N*-acetyl-D-glucosamine disaccharide units. It is extracted from cocks' combs or obtained by fermentation from streptococci (Lancefield Groups A and C). A white or almost white, very hygroscopic powder or a fibrous aggregate. Sparingly soluble to soluble in water; practically insoluble in dehydrated alcohol and in acetone. A 0.5% solution in water has a pH of 5.0 to 8.5. Store in airtight containers. Protect from light and humidity.

Adverse Effects

There have been reports of a transient rise in intra-ocular pressure when sodium hyaluronate was given into the eye. When injected into the knee, pain and inflammation may occur at the injection site. There have also been occasional reports of hypersensitivity, including, rarely, anaphylaxis.

Effects on the eyes. Crystalline deposits on intra-ocular lenses have been reported in patients after use of a high viscosity sodium hyaluronate preparation during cataract surgery.[1]

1. Jensen MK, *et al.* Crystallization on intraocular lens surfaces associated with the use of Healon GV. *Arch Ophthalmol* 1994; **112:** 1037–42.

Effects on the skin. A cutaneous granulomatous reaction has been reported in a woman 5 weeks after treatment with synthetic hyaluronic acid for cosmetic use as a dermal filler.[1] All cutaneous lesions resolved spontaneously within 3 months without scarring.

1. Ghislanzoni M, *et al.* Cutaneous granulomatous reaction to injectable hyaluronic acid gel. *Br J Dermatol* 2006; **154:** 755–8.

Inflammatory reaction. Severe peritoneal inflammation has been reported[1] after use of a sodium hyaluronate-based bioresorbable membrane to prevent postoperative adhesion formation.

1. Klingler PJ, *et al.*. Seprafilm -induced peritoneal inflammation: a previously unknown complication: report of a case. *Dis Colon Rectum* 1999; **42:** 1639–43.

Uses and Administration

Hyaluronic acid is widely distributed in body tissues and intracellular fluids, including the aqueous and vitreous humour, and synovial fluid; it is a component of the ground substance or tissue cement surrounding cells.

A viscous solution of sodium hyaluronate is used during surgical procedures on the eye, for example for cataract extraction. Introduction of the solution into the anterior or posterior chamber via a fine cannula or needle allows tissues to be separated during surgery and protects them from trauma. Sodium hyaluronate eye drops 0.1% are also used for the relief of dry eye and as a contact lens lubricant.

Sodium hyaluronate is given by intra-articular injection in the treatment of osteoarthritis of the knee. Doses vary according to the preparation used, but are of the order of 20 to 25 mg once weekly for 5 weeks or up to 30 mg once weekly for 3 or 4 weeks; it is generally recommended that the treatment course for any individual joint should not be repeated within 6 months. Sodium hyaluronate is also used during arthroscopic procedures to flush out irrigating solutions and act as a temporary substitute for synovial fluid.

Hyaluronic acid is applied topically to promote wound healing. Zinc hyaluronate has also been used. A film containing sodium hyaluronate and carmellose is used to prevent surgical adhesion. Sodium hyaluronate has also been used in the management of lesions of the oral mucosa.

Hylans, which are polymers derived from hyaluronic acid, are used similarly for osteoarthritis and wound care.

Sodium hyaluronate instilled intravesically has been used as a temporary replacement of the glycosaminoglycan layer in the bladder for the symptomatic treatment of interstitial cystitis.

Topical formulations of diclofenac in hyaluronic acid (CT-1101, AT-2101) are used in the treatment of actinic keratoses (but distinguish from an oral formulation of isofagomine tartrate (p.2327) under investigation for use in Gaucher disease that also carries the code AT-2101).

Hyaluronic acid has been used as a dermal filler for the correction of moderate to severe facial wrinkles and folds (see Photoageing, p.1581).

Actinic keratoses. For references to the use of diclofenac in a hyaluronic acid gel in the treatment of actinic keratoses, see p.46.

Dry eye. The usual management of dry eye (p.2140) is with artificial tears. Sodium hyaluronate has also been reported to be of some benefit. Alleviation of symptoms[1-3] and an increase in tear film stability[1,2] has been shown after topical application of sodium hyaluronate solution (0.1 or 0.2%) compared with saline-based placebo solutions. However, another study[4] failed to show any advantage over placebo, although it has been suggested[4,5] that sodium hyaluronate might play a role in maintaining a healthy corneal epithelium.

5. Aragona P, *et al.* Long term treatment with sodium hyaluronate-containing artificial tears reduces ocular surface damage in patients with dry eye. *Br J Ophthalmol* 2002; **86:** 181–4.

Osteoarthritis. In osteoarthritis, the size and concentration of hyaluronic acid molecules naturally present in synovial fluid is reduced. Thus, one approach in the management of osteoarthritis (p.11) of the knee is viscosupplementation of the synovial fluid by the intra-articular injection of hyaluronic acid or its derivatives. Such injections may reduce pain over 1 to 6 months but may be associated with a short-term increase in knee inflammation; there is some suggestion that any benefit is longer lasting than with intra-articular corticosteroids. Some studies suggest that viscosupplementation may be an effective option for patients who are unable to take oral NSAIDs or have regular intra-articular corticosteroids, and who are unsuitable candidates for joint replacement surgery, although there appears to be considerable variability in clinical response between products, as well as in the variables being assessed and length of treatment.

Hyaluronidase *(BAN, rINN)*

Hialuronidasa; Hialuronidáz; Hialuronidazė; Hiyalüronidaz; Hyaluronidaasi; Hyaluronidas; Hyaluronidasa; Hyaluronidasum.

Гиалуронидаза

CAS — 9001-54-1.
ATC — B06AA03.
ATC Vet — QB06AA03.

NOTE. The name kinetin (p.1603) has also been used as a proprietary name for hyaluronidase.

Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii). *US* includes as an injectable form.

Ph. Eur. 6.2 (Hyaluronidase). An enzyme capable of hydrolysing mucopolysaccharides of the hyaluronic acid type. It is prepared from the testes of mammals by a method that has been shown to reduce contamination by known infectious agents to acceptable limits; a suitable stabilising agent may be added to the purified preparation. A white or yellowish-white, amorphous powder; it contains not less than 300 international units of hyaluronidase activity per mg, calculated with reference to the dried substance. Soluble in water; practically insoluble in alcohol and in acetone. A 0.3% solution in water has a pH of 4.5 to 7.5. Store at 2° to 8° in airtight containers.

Units

The international and USP units are equivalent. One international or USP unit is equivalent to one turbidity-reducing unit or about 3.3 viscosity-reducing units.

Adverse Effects and Precautions

Sensitivity to hyaluronidase occasionally occurs. Because of the danger of spreading infection, the enzyme generally should not be injected into or around an infected area. It has been suggested that the presence of malignancy may similarly be a contra-indication to the use of hyaluronidase. It should not be given by intravenous injection nor should it be used for anaesthetic procedures in cases of unexplained premature labour. Hyaluronidase should not be applied directly to the cornea. It should not be used to reduce the swelling of bites or stings.

Uses and Administration

Hyaluronidase is an enzyme that reversibly depolymerises hyaluronic acid (above), a component of the ground substance or tissue cement surrounding cells, thereby temporarily reducing its viscosity and rendering the tissues more readily permeable to injected fluids.

Hyaluronidase is used to increase the speed of absorption and reduce discomfort due to subcutaneous or intramuscular injection of fluids, to promote resorption of excess fluids and extravasated blood in the tissues, and to increase the effectiveness of local anaesthesia.

In the UK, the usual dose as an adjunct to subcutaneous or intramuscular injection is 1500 units, added directly to the injection. To aid the dispersal of extravasated fluids or blood, the same dose is given in 1 mL of Water for Injections or 0.9% sodium chloride into the affected area. Lower doses of hyaluronidase are used in some countries; in the USA, the usual dose is 150 units.

In hypodermoclysis, hyaluronidase is used to aid the subcutaneous administration of relatively large volumes of fluids, especially in infants and young children, where intravenous injection is difficult. Care should be taken in the treatment of children and the elderly to control the speed and total volume given and to avoid overhydration. Hyaluronidase may be added to the injection fluid or may be injected into the site before the fluid is given. In the UK, 1500 units of hyaluronidase is generally given with each 500 to 1000 mL of fluid for subcutaneous use, but in the USA, 150 units of hyaluronidase is considered adequate for each litre of hypodermoclysis solution.

The diffusion of local anaesthetics is accelerated by the addition of 1500 units (in the USA, 150 units) of hyaluronidase to the anaesthetic solution. It has also been used in ophthalmology as an aid to local anaesthesia at recommended doses of 15 units/mL of local anaesthetic solution. Hyaluronidase has also been used for the treatment of vitreous haemorrhage and diabetic retinopathy.

To improve the resorption of radiopaque agents in subcutaneous urography, hyaluronidase is injected subcutaneously in a dose of 75 units over each scapula followed by injection of the contrast medium at the same site.

Recombinant human hyaluronidase is used for the preparation of oocytes during IVF.

Hyalosidase (GL enzyme) is a highly purified form of hyaluronidase that has been studied.

◊ General references.

Ophthalmic surgery. In a study[1] involving 150 consecutive patients undergoing surgery for senile cataract, retrobulbar anaesthesia with lidocaine 2% solution plus adrenaline 1:100 000 and hyaluronidase 15 units/mL produced successful anaesthesia in 69 of 75 cases (92%), which was significantly better than 42 of 75 treated with lidocaine plus adrenaline alone. Although poor results have been reported from hyaluronidase and a local anaesthetic without adrenaline to restrict local anaesthetic absorption, the use of the enzyme and adrenaline was recommended as an aid to achieving complete ocular akinesia and anaesthesia in cataract surgery. Hyaluronidase has also been used with a mixture of bupivacaine and lidocaine for peribulbar anaesthesia, but results have been conflicting. In a study[2] in 50 patients, addition of hyaluronidase 25 units/mL of local anaesthetic mixture had no significant effect on time to satisfactory anaesthesia. However, in a second study[3] involving 200 patients, addition of hyaluronidase 50 or 300 units/mL improved the quality of the peribulbar block and, in the case of the higher concentration, also increased the speed of onset.

Hydrangea

Hidrangea; Seven Barks; Smooth Hydrangea; Wild Hydrangea.

Profile

Hydrangea, the root of *Hydrangea arborescens* (Hydrangeaceae), has diuretic and litholytic properties and is used for genitourinary disorders including renal and urinary calculi.

Homoeopathy. Hydrangea has been used in homoeopathic medicines under the following names: Hydrangea arborescens; Hydrang.

Preparations

Proprietary Preparations (details are given in Part 3)

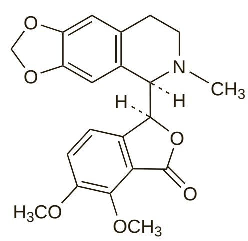
Multi-ingredient: ***UK:*** Antiglan; Backache.

Hydrastine Hydrochloride

Hidrastina, hidrocloruro de; Hydrastyny chlorowodorek. 6,7-Dimethoxy-3-(5,6,7,8-tetrahydro-6-methyl-1,3-dioxolo[4,5-g]isoquinolin-5-yl)isobenzofuran-1(3*H*)-one hydrochloride.

$C_{21}H_{21}NO_6,HCl = 419.9.$

CAS — 118-08-1 (hydrastine); 5936-28-7 (hydrastine hydrochloride).



(hydrastine)

Profile

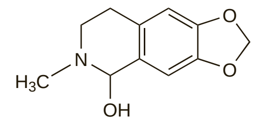
Hydrastine hydrochloride, the hydrochloride of an alkaloid obtained from *Hydrastis canadensis* (Ranunculaceae) (see Hydrastis, below), has been reputed to cause uterine contractions and arrest uterine haemorrhage but it is of doubtful value. It was also formerly used in gastrointestinal disorders. Toxic doses are reported to cause strychnine-like convulsions and relaxation of the gut.

Hydrastinine Hydrochloride

Idrastinina Cloruro. 5,6,7,8-Tetrahydro-6-methyl-1,3-dioxolo[4,5-g]isoquinolin-5-ol hydrochloride.

$C_{11}H_{11}NO_2,HCl = 225.7.$

CAS — 6592-85-4 (hydrastinine); 4884-68-8 (hydrastinine hydrochloride).



(hydrastinine)

Profile

Hydrastinine is a derivative of the alkaloid hydrastine (p.2321) and has been used similarly. It has vasoconstrictor properties and has been used as the hydrochloride as an ingredient of topical preparations for minor eye disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Dacrin; Haemanal.

Hydrastis

Golden Seal; Goldenseal; Hidraste; Hidrastis; Hydrast.; Hydrastidis Radix; Hydrastis rhizoma; Hydrastisjuuri; Hydrastisrot; Idraste; Kanadinių auksašaknių šakniastiebiai; Vodilkový kořen; Yellow Root.

Pharmacopoeias. In *Eur.* (see p.vii) and *US*.

Ph. Eur. 6.2 (Goldenseal Rhizome; Goldenseal Root BP 2008). The whole or cut, dried rhizome and root of *Hydrastis canadensis* containing not less than 2.5% of hydrastine and not less than 3.0% of berberine, calculated on the dried basis. Protect from light.

USP 31 (Goldenseal). The dried roots and rhizomes of *Hydrastis canadensis* (Ranunculaceae), containing not less than 2.0% of hydrastine and not less than 2.5% of berberine, calculated on the dried basis. Store in airtight containers. Protect from light, moisture, and heat.

Profile

Hydrastis was formerly used to arrest excessive uterine haemorrhage. It is included in some herbal preparations for gastrointestinal disorders and peripheral vascular disorders. The pharmacological activity of hydrastis is attributed primarily to 2 of its constituent alkaloids, berberine (p.2264) and hydrastine (above).

Homoeopathy. Hydrastis has been used in homoeopathic medicines under the following names: Hydrastis canadensis; Hydr. can.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Gingivitol N.

Multi-ingredient: ***Austral.:*** Bilberry Plus; Euphrasia Complex; Herbal Cleanse†; Hydrastis Complex†; Sambucus Complex†; Urapro†; Urinase†; ***Braz.:*** Bromidrastina†; ***Canad.:*** Echinacea Goldenseal Formula†; ***Fr.:*** Climaxol; ***Spain:*** Proctosor†; Solucion Schoum; ***Turk.:*** Ma-Ka-Ta; ***UK:*** Digestive; HRI Golden Seal Digestive; Wind & Dyspepsia Relief.

Hydrazine Sulfate

Hidrazina, sulfato de; Hydrazine Sulphate; Hydrazyny siarczan.

$H_6N_2O_4S = 130.1.$

CAS — 302-01-2 (hydrazine); 10034-93-2 (hydrazine sulfate).

$H_2N{-}NH_2$

(hydrazine)

Profile

Hydrazine sulfate is employed in various industrial processes. It is used in the preparation of hydrazine hydrate which is applied after a solution of platinic chloride for corneal tattooing. It has been tried, but with little if any benefit, in the management of cancer-related anorexia and cachexia.

Adverse effects and treatment. References to adverse effects resulting from exposure to hydrazine.[1-5] Pyridoxine has been used in the management of hydrazine intoxication.[6-8]

Proprietary Preparations (details are given in Part 3)
Rus.: Sehydrin (Сегидрин).

Hydrochloric Acid

Acide chlorhydrique; Acidum Hydrochloricum; Acidum hydrochloridum; Clorhídrico, ácido; E507; Kloorivetyhappo; Kwas solny; Kyselina chlorovodíková; Saltsyra; Salzsäure; Sósav; Suolahappo; Vandenilio chlorido rūgštis; Vetykloridihappo.

HCl = 36.46.
CAS — 7647-01-0.
ATC — A09AB03; B05XA13.
ATC Vet — QA09AB03; QB05XA13.

NOTE. The impure acid of commerce is known as Spirits of Salt and as Muriatic Acid.

Pharmacopoeias. *Chin.*, *Eur.* (see p.vii), *Int.*, *Jpn*, *Swiss*, and *Viet.* include various concentrations. Also in *USNF.*

Ph. Eur. 6.2 (Hydrochloric Acid, Concentrated; Acidum Hydrochloridum Concentratum; Hydrochloric Acid BP 2008). It contains 35.0 to 39.0% w/w of HCl. A clear, colourless, fuming liquid. Miscible with water. Store below 30° in stoppered containers of glass or other inert material.

Ph. Eur. 6.2 (Hydrochloric Acid, Dilute; Acidum Hydrochloridum Dilutum). It contains 9.5 to 10.5% w/w of HCl prepared by mixing hydrochloric acid 274 g with water 726 g.

USNF 26 (Hydrochloric Acid). It contains 36.5 to 38.0% w/w of HCl. A colourless, fuming liquid having a pungent odour. It ceases to fume when it is diluted with 2 volumes of water. Store in airtight containers.

USNF 26 (Diluted Hydrochloric Acid). It contains 9.5 to 10.5% w/v of HCl and may be prepared by mixing hydrochloric acid 226 mL with sufficient water to make 1000 mL. A colourless, odourless liquid. Store in airtight containers.

Adverse Effects

Hydrochloric acid is highly irritant and corrosive and ingestion has proved fatal. The corrosive effect causes chemical burns and severe pain. There may be violent vomiting, haematemesis, and circulatory collapse; acids can also produce intravascular coagulation and haemolysis. Ulceration may lead to perforation and patients can suffer strictures and pyloric stenosis. Asphyxiation may result from laryngeal oedema. Inhalation of acid fumes or aspiration of ingested acids may cause pneumonitis.

◊ References.

1. WHO. Chlorine and hydrogen chloride. *Environmental Health Criteria 21*. Geneva: WHO, 1982. Available at: http://www.inchem.org/documents/ehc/ehc/ehc21.htm (accessed 16/06/04)
2. Munoz Munoz E, *et al*. Massive necrosis of the gastrointestinal tract after ingestion of hydrochloric acid. *Eur J Surg* 2001; **167:** 195–8.

Treatment of Adverse Effects

Treatment of ingestion is mainly symptomatic. Gastric lavage and activated charcoal are not generally appropriate and emetics must *not* be used. Small amounts of water or milk may be given to dilute the acid but larger volumes may increase the risk of emesis and hence of further damage. Neutralising agents are not recommended because of the possibility of heat being produced during exothermic reactions, which may increase the injury further. Opioid analgesia may be required for pain. Endoscopy should be performed and surgical intervention may be necessary. There is little evidence to support the value of corticosteroids in preventing stricture formation.

Acid burns of the skin should be flooded immediately with water and the washing should be copious and prolonged. Any affected clothing should be removed while flooding is being carried out. For burns in the eye, the lids should be kept open and the eye flushed with a steady stream of water at room temperature or sodium chloride 0.9%. A few drops of a local anaesthetic solution will relieve lid spasm and facilitate irrigation.

Uses and Administration

Hydrochloric acid has been used as an escharotic. It has been used in the diluted form for the treatment of achlorhydria and other gastrointestinal disorders. It has also been given intravenously in the management of metabolic alkalosis (p.1667). An acid perfusion test using hydrochloric acid has been used in the diagnosis of oesophageal disorders. When taken orally, it should be sipped through a straw to protect the teeth.

Homoeopathy. Hydrochloric acid has been used in homoeopathic medicines under the following names: Acidum hydrochloricum; Muriaticum acidum; Hydrochloridum acidum; Chlorhydricum acidum; Acidum muriaticum; Ac. mur.

Diagnosis and testing. References and comments on the use of an acid perfusion test in the diagnosis of oesophageal disorders,[1-5] such as gastro-oesophageal reflux disease (p.1696) and oesophageal motility disorders (p.1702). The test involves intra-oesophageal perfusion of 0.1M hydrochloric acid; subsequent development of pain indicates an acid-sensitive oesophagus. This test has also been used in the differential diagnosis of angina.[2]

Multi-ingredient: *Ital.:* Gastro-Pepsin; ***S.Afr.:*** Sentinel Ulcer Mixture.

Hydrofluoric Acid

Fluohydric Acid; Fluorhídrico, ácido; Fluoric Acid; Kwas fluorowodorowy.

HF = 20.01.
CAS — 7664-39-3.

Description. Hydrofluoric acid is a solution of hydrogen fluoride in water. Various strengths are used. It attacks glass strongly.

Adverse Effects

As for Hydrochloric Acid, above. Although the corrosive effects of hydrofluoric acid tend to predominate, absorption may produce systemic fluoride poisoning as described under Sodium Fluoride, p.1962.

The pain from contact with weak solutions may be delayed, so that the patient is not aware of being burnt until some hours later, when the area begins to smart; intense pain then sets in and this may persist for several days. Destruction of tissue proceeds under the toughened coagulated skin, so that the ulcers extend deeply, heal slowly, and leave a scar.

The fumes of hydrofluoric acid are highly irritant.

Treatment of Adverse Effects

The initial treatment of poisoning after oral exposure to hydrofluoric acid is similar to that described for hydrochloric acid, see above. Calcium gluconate should also be given intravenously to correct known or suspected hypocalcaemia. Burns in the eye are also managed as for hydrochloric acid, although irrigation of the eye may be continued with calcium gluconate solution 2% after initial flood with water or sodium chloride 0.9%.

In the event of skin burns with hydrofluoric acid, contaminated clothing or articles should be removed and the skin washed with copious cold water. A calcium gluconate gel is sometimes used and it may be necessary to infiltrate the affected areas with calcium gluconate intradermally or subcutaneously. Regional intravenous infusion of calcium gluconate may be necessary in severe burns of the forearm, hand, or fingers; if ineffective, intra-arterial infusion for burns of the fingers may be considered. Hydrofluoric acid passes through finger- and toe-nails without causing any apparent damage; nails will therefore have to be removed or perforated to be able to treat the underlying tissues. Other first-aid measures reported to be effective include prolonged soaks in iced solutions of benzalkonium chloride; iced water has sometimes been used as has iced magnesium sulfate solution. Local anaesthesia may be needed. Burn eschars should be excised and necrotic tissue debrided. Absorption may lead to systemic fluoride toxicity and the need for intravenous calcium gluconate to manage hypocalcaemic symptoms.

7. Foster KN, *et al.* Hydrofluoric acid burn resulting from ignition of gas from a compressed air duster. *J Burn Care Rehabil* 2003; **24:** 234–8.

Uses

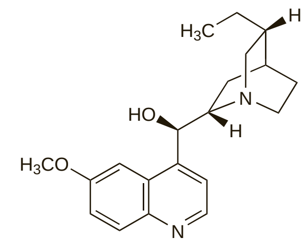
Hydrofluoric acid is used in industry. Its main use has been for the production of fluorocarbons for use as refrigerants and propellants. It has also been used as an ingredient of preparations for glass etching and rust removal.

Homoeopathy. Hydrofluoric acid has been used in homoeopathic medicines under the following names: Fluoricum acidum; Acidum hydrofluoricum; Ac. fluor.

Hydroquinine Hydrobromide

Dihydrochinin Hydrobromide; Dihydroquinine Hydrobromide; Hidroquinina, hidrobromuro de; Hydrochinin Hydrobromide; Methylhydrocupreine Hydrobromide. 8α,9*R*-10,11-Dihydro-6′-methoxycinchonan-9-ol hydrobromide.

$C_{20}H_{26}N_2O_2,HBr$ = 407.3.
CAS — 522-66-7 (hydroquinine).
ATC — M09AA01.
ATC Vet — QM09AA01.



(hydroquinine)

NOTE. Do not confuse with Hydroquinone (p.1598).

Profile

Hydroquinine is a derivative of quinine (p.612) used similarly in the treatment of nocturnal muscle cramps. It is given as the hydrobromide in an oral dose of 200 mg with the evening meal and a further 100 mg at bedtime for 14 days.

Muscle spasm. Quinine and its derivatives such as hydroquinine have traditionally been used for the prevention of nocturnal cramps (p.1887) but there has been concern over their efficacy and potential for adverse effects, especially in the elderly.

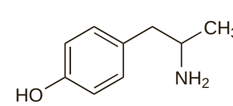
Hydroxyamfetamine Hydrobromide

(BANM, rINNM) ⊗

Bromhidrato de Hidroxianfetamina; Hidrobromuro de hidroxianfetamina; Hydroxyamfétamine, Bromhydrate d'; Hydroxyamfetamini Hydrobromidum; Hydroxyamphetamine Hydrobromide; *p*-Hydroxyamphetamine Hydrobromide; Oxamphetamine Hydrobromide. (±)-4-(2-Aminopropyl)phenol hydrobromide.

Гидроксиамфетамина Гидробромид

$C_9H_{13}NO,HBr$ = 232.1.
CAS — 103-86-6 (hydroxyamfetamine); 1518-86-1 ((±)-hydroxyamfetamine); 306-21-8 (hydroxyamfetamine hydrobromide); 140-36-3 ((±)-hydroxyamfetamine hydrobromide).



(hydroxyamfetamine)

Pharmacopoeias. In *US.*

USP 31 (Hydroxyamphetamine Hydrobromide). A white, crystalline powder. Freely soluble in water and in alcohol; slightly soluble in chloroform; practically insoluble in ether. Its solutions in water are slightly acid to litmus, having a pH of about 5. Protect from light.

Profile

Hydroxyamfetamine hydrobromide is a sympathomimetic with an action similar to that of ephedrine (p.1559), but it has little or no stimulant effect on the CNS. It was formerly used as a vasopressor and in the management of some cardiac disorders.

In ophthalmology, hydroxyamfetamine hydrobromide has been used in a 1% solution as a mydriatic and in the diagnosis of Horner's syndrome.

Preparations

USP 31: Hydroxyamphetamine Hydrobromide Ophthalmic Solution.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***USA:*** Paremyd.

Hydroxyapatite *(BAN)*

542 (edible bone phosphate); Durapatite *(USAN)*; Hidroxiapatito; Hydroxylapatite; Win-40350. Decacalcium dihydroxide hexakis(orthophosphate).

$3Ca_3(PO_4)_2,Ca(OH)_2$ =1004.6;
$Ca_5(OH)(PO_4)_3$ =502.3.
CAS — 1306-06-5.

Profile

Hydroxyapatite is a natural mineral with composition similar to that of the mineral in bone. Hydroxyapatite for therapeutic purposes is prepared from bovine bone and contains, in addition to calcium and phosphate, trace elements, fluoride and other ions, proteins, and glycosaminoglycans. It is given orally to patients requiring both calcium and phosphorus supplementation. Hydroxyapatite with tricalcium phosphate has been used in bone grafts.

Hydroxyapatite derived from marine coral has been used in the construction of orbital implants for use after surgical removal of the eye. A synthetic calcium hydroxyapatite (CaHA) is used for the correction of facial lipoatrophy in patients with HIV infection and as a cosmetic filler for moderate to severe facial wrinkles and folds.

Adverse effects. Reference to problems associated with the use of coral-derived orbital implants[1] and synthetic calcium hydroxyapatite.[2]

1. Shields CL, *et al.* Problems with the hydroxyapatite orbital implant: experience with 250 consecutive cases. *Br J Ophthalmol* 1994; **78:** 702–6.
2. Sankar V, McGuff HS. Foreign body reaction to calcium hydroxylapatite after lip augmentation. *J Am Dent Assoc* 2007; **138:** 1093–96.

Uses. A mixture of calcium phosphates with calcium carbonate could be combined to form a paste which could be injected into acute fractures;[1] under physiological conditions the paste hardened within minutes, due to the formation of dahllite, a carbonated apatite, and held the bones in place as it was progressively replaced by living bone.

1. Constantz BR, *et al.* Skeletal repair by in situ formation of the mineral phase of bone. *Science* 1995; **267:** 1796–9.

ATC Vet — QA01AB07; QD08AH03; QG01AC30; QR02AA14.

Pharmacopoeias. In *Br., Fr.,* and *Ger.*

BP 2008 (Potassium Hydroxyquinoline Sulphate). An equimolecular mixture of potassium sulfate and quinolin-8-ol sulfate monohydrate. It contains 50.6 to 52.6% of quinolin-8-ol and 29.5 to 32.5% of potassium sulfate, calculated with reference to the anhydrous substance. A pale yellow, odourless or almost odourless, microcrystalline powder. Freely soluble in water; insoluble in ether. On extraction with hot dehydrated alcohol a residue of potassium sulfate and a solution of quinolin-8-ol sulfate are obtained.

Profile

Hydroxyquinoline sulfate and potassium hydroxyquinoline sulfate have antibacterial, antifungal, and deodorant properties, and have been used similarly in the topical treatment of skin, oropharyngeal, and vaginal disorders. Potassium hydroxyquinoline sulfate is often used with benzoyl peroxide.

Derivatives of hydroxyquinoline including the salicylate, benzoate, borate, hydrofluoride, iodochloride, silicofluoride, and sodium hydroxyquinoline sulfate have been used similarly.

Preparations

BP 2008: Potassium Hydroxyquinoline Sulphate and Benzoyl Peroxide Cream.

Hyoscyamus

Banotu; Beleño; Bilsenkraut; Bolmört; Giusquiamo; Henbane; Hullukaali; Hyoscy.; Hyoscyami; Hyoscyami folium (hyoscyamus leaf); Jusquiame; Jusquiame Noire; Jusquiame noire, feuille de (hyoscyamus leaf); Meimendro.

Pharmacopoeias. *Chin.* specifies only the seeds.

Eur. (see p.vii) includes a form for homoeopathic preparations.

Ph. Eur. 6.2 (Hyoscyamus for Homoeopathic Preparations; Hyoscyamus Niger ad Praeparationes Homoeopathicas). The whole, fresh flowering plant of *Hyoscyamus niger.* Protect from light.

Profile

Hyoscyamus contains the alkaloid hyoscyamine with varying amounts of hyoscine and has peripheral and central effects similar to those of atropine (p.1219); its preparations have been used mainly for the relief of visceral spasm. The fresh whole flowering plant (*Hyoscyamus niger*) as well as the dried leaves have been used in herbal and medicine.

Homoeopathy. Hyoscyamus has been used in homoeopathic medicines under the following names: Hyoscyamus leaf; Hyoscyamus niger; Hyos. nig.

Preparations

Proprietary Preparations (details are given in Part 3)
Austria: Kelosoft; ***Switz.:*** Kelosoft; ***Venez.:*** Atroveran.

Multi-ingredient: ***Arg.:*** Hepacur; Trixol†; ***Braz.:*** Dorveran†; Ductoveran; Espasmalgon†; MM Expectorante; Sedatux†; ***Denm.:*** Zink-Calmitol†; ***Fr.:*** Laccoderme a l'huile de cade; ***Ger.:*** Unguentum lymphaticum; ***Switz.:*** Cardiodoron†; Dragees S contre la toux†; Gouttes contre la toux "S"; Kelimed; Sirop pectoral contre la toux S; Sirop S contre la toux et la bronchite; ***UK:*** Onopordon Comp B; ***Venez.:*** Atrobel; Cloverin†; Cratex†; Linfoderm; Neo-Atropan†; Tropifen†.

Hypoglycin A

Hipoglicina A. L-2-Amino-3-(2-methylenecyclopropyl)propionic acid.

$C_7H_{11}NO_2$ = 141.2.
CAS — 156-56-9.

Profile

Hypoglycin A is a toxic substance present in the arillus of unripe ackee (akee), the fruit of *Blighia sapida* (Sapindaceae). It is responsible for Jamaican vomiting sickness, with symptoms of acute and severe vomiting, hypoglycaemia, muscular weakness, CNS depression, convulsions, and coma, frequently fatal. Glycine has been suggested for the management of hypoglycin A toxicity.

Hypophosphorous Acid

Acidum Hypophosphorosum; Hipofosforoso, ácido; Phosphinic Acid.

H_3PO_2 = 66.0.
CAS — 6303-21-5; 14332-09-3.

Pharmacopoeias. In *USNF.*

USNF 26 (Hypophosphorous Acid). It contains 30 to 32% of H_3PO_2. A colourless or slightly yellow, odourless liquid. Store in airtight containers.

Profile

Hypophosphorous acid is used as an antoxidant. Hypophosphates were used in tonics; like the glycerophosphates they are not a suitable source of phosphorus.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** Dispello.

Hyssop

Herba Hyssopi; Hysope; Hyssop Wort; Ysop.

Pharmacopoeias. In *Fr.*

Profile

Hyssop is the fresh or dried aerial parts of *Hyssopus officinalis* (Lamiaceae). The herb and its preparations are included in herbal preparations mainly for disorders of the gastrointestinal and upper respiratory tracts.

It is the source of hyssop oil which is used in aromatherapy.

Preparations

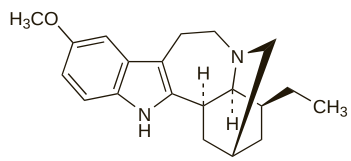
Proprietary Preparations (details are given in Part 3)
Cz.: Yzop Lekarsky†.

Multi-ingredient: ***Arg.:*** Arceligasol; ***Austria:*** The Chambard-Tee; ***Fr.:*** Item Lentes; Mediflor Tisane Circulation du Sang No 12; Mediflor Tisane Digestive No 3; ***Ital.:*** Tisana Kelemata; ***Pol.:*** Pectosol; ***Port.:*** Solubeol†; ***Rus.:*** Linkus (Линкас); Linkus Lor (Линкас Лор); ***Spain:*** Agua del Carmen; Natusor Asmaten†; ***Switz.:*** Saintbois; ***UK:*** Catarrh Mixture; Tickly Cough & Sore Throat Relief; Vegetable Cough Remover.

Ibogaine

Ibogaina; NIH-10567. 12-Methoxyibogamine.

$C_{20}H_{26}N_2O$ = 310.4.
CAS — 83-74-9.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of ibogaine or preparations containing ibogaine:
Iboga.

Profile

Ibogaine is a hallucinogenic indole alkaloid extracted from the West African shrub *Tabernanthe iboga* (Apocynaceae). It has been investigated as an aid to withdrawal from drug addiction.

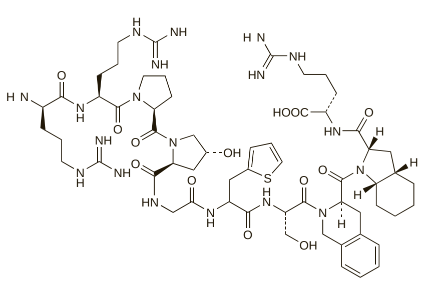
Icatibant Acetate *(USAN, rINNM)*

Hoe-140 (icatibant, icatibant acetate); Icatibant, Acétate d'; Icatibanti Acetas; Icatibanto; JE-049 (icatibant). (*R*)-Arginyl-(*S*)-arginyl-(*S*)-prolyl-(2*S*,4*R*)-(4-hydroxyprolyl)glycyl-(*S*)-[3-(2-thienyl)-alanyl]-(*S*)-seryl-(*R*)-[(1,2,3,4-tetrahydro-3-isoquinolyl)-carbonyl]-(2*S*,3a*S*,7a*S*)-[(hexahydro-2-indolinyl)-carbonyl]-(*S*)-arginine acetate.

Икатибанта Ацетат

$C_{59}H_{89}N_{19}O_{13}S,xC_2H_4O_2$.
CAS — 130308-48-4 (icatibant); 138614-30-9 (icatibant acetate).



Profile

Icatibant acetate is a selective bradykinin B_2 antagonist under investigation for hereditary angioedema.

Iceland Moss

Islandinių kerpenų gniužulas; Isländisches Moos; Islandslav; Islanninjäkälä; Izlandi zuzmó; Lichen d'Islande; Lichen islandicus; Lišejník islandský; Porost islandzki.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Iceland Moss; Lichen Islandicus). The whole or cut dried thallus of *Cetraria islandica*. Protect from light.

Profile

Iceland moss, *Cetraria islandica* (Parmeliaceae), is a lichen with demulcent and mild antimicrobial activity. It is included in herbal medicines for dry cough, and irritation or inflammation of the oral and pharyngeal mucosa. It is also used as a bitter to stimulate the appetite.

Iceland moss has been used as a foodstuff and a flavouring agent.

Preparations

Proprietary Preparations (details are given in Part 3)

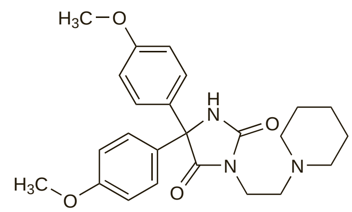
Idanpramine

Idampramina. 5,5-Bis(4-methoxyphenyl)-3-[2-(1-piperidinyl)-ethyl]-2,4-imidazolidinedione.

Иданпрамин

$C_{24}H_{29}N_3O_4$ = 423.5 112 25466-44-8.
ATC — A03AX06.
ATC Vet — QA03AX06.



Idanpramine Hydrochloride

Иданпрамина Гидрохлорид

$C_{24}H_{29}N_3O_4$,HCl = 460.0.
CAS — 25466-21-1.
ATC — A03AX06.
ATC Vet — QA03AX06.

Idanpramine Sulfate

Idampramina Sulfato.

Иданпрамина Сульфат

ATC — A03AX06.
ATC Vet — QA03AX06.

Profile

Idanpramine is an antimuscarinic that has been used as the hydrochloride and sulfate salts in the relief of visceral spasms.

Preparations

Proprietary Preparations (details are given in Part 3)
Port.: Gastroidam.

Idursulfase *(BAN, USAN, rINN)*

Iduronate-2-sulfatase; Idursulfasa; Idursulfasum; Idusulfase. α-L-Iduronate sulfate sulfatase.

Идусульфас

CAS — 50936-59-9.
ATC — A16AB09.
ATC Vet — QA16AB09.

Profile

Idursulfase is recombinant human iduronate-2-sulfatase used as enzyme replacement therapy in the treatment of mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder that results in the accumulation of glycosaminoglycans in cells with consequent progressive damage. Idursulfase is given by intravenous infusion in a dose of 500 micrograms/kg once a week. Infusion reactions are common and treatment with antihistamines with or without corticosteroids, or a reduction in infusion rate may be necessary. Stopping the infusion should be considered in severe reactions. Anaphylactoid reactions have been reported, in some cases up to 24 hours after the infusion.

Idursulfase should be diluted in 100 mL of sodium chloride 0.9% and infused over 1 to 3 hours. The initial infusion rate should be 8 mL/hour for the first 15 minutes, which may then be increased by 8 mL/hour every 15 minutes if well tolerated, up to a maximum rate of 100 mL/hour. If the infusion rate is decreased because of infusion reactions, the infusion time should not exceed 8 hours because of lack of preservative in the product.

Preparations

Proprietary Preparations (details are given in Part 3)
Cz.: Elaprase; ***Port.:*** Elaprase; ***UK:*** Elaprase; ***USA:*** Elaprase.

Indigo Carmine

Blue X; Ceruleinum; CI Food Blue 1; Colour Index No. 73015; Disodium Indigotin-5,5′-disulphonate; E132; FD & C Blue No. 2; Indicarminum; Indigo Karmin; Indigotina; Indigotindisulfonate Sodium; Indigotine; Indygokarmin; Sodium Indigotindisulphonate. Disodium 3,3′-dioxo-2,2′-bi-indolinylidene-5,5′-disulphonate.

$C_{16}H_8N_2Na_2O_8S_2$ = 466.4.
CAS — 483-20-5 (indigotin-5,5′-disulphonic acid); 860-22-0 (indigo carmine).
ATC — V04CH02.
ATC Vet — QV04CH02.

NOTE. The name Cerulein has been applied to Ceruletide (p.2279).

Pharmacopoeias. In *It.*, *Jpn*, and *US.*

USP 31 (Indigotindisulfonate Sodium). A dusky, purplish-blue powder, or blue granules having a coppery lustre. Soluble 1 in 100 of water; slightly soluble in alcohol; practically insoluble in most other organic solvents. Its solutions have a blue or bluish-purple colour. Store in airtight containers at a temperature of 25°, excursions permitted between 15° and 30°. Protect from light.

Adverse Effects and Precautions

Indigo carmine may cause nausea, vomiting, hypertension, and bradycardia, and occasionally, hypersensitivity reactions such as skin rash, pruritus, and bronchoconstriction. Skin discoloration may occur after large parenteral doses.

Hypersensitivity. Cardiac arrest after a dose of indigo carmine 80 mg intravenously resulted in the deaths of 2 elderly patients.[1] Both had a history of asthmatic bronchitis. A life-threatening anaphylactoid reaction associated with indigo carmine use has also been reported, although the authors commented that such events are rare.[2]

1. Voiry AM, *et al.* Deux accidents mortels lors d'une injection peropératoire de carmin d'indigo. *Ann Med Nancy* 1976; **15:** 413–19.
2. Gousse AE, *et al.* Life-threatening anaphylactoid reaction associated with indigo carmine intravenous injection. *Urology* 2000; **56:** 508.

Uses and Administration

On intravenous injection indigo carmine is rapidly excreted, principally by the kidneys. It has been used in a test of renal function, but has largely been replaced by agents that give more precise results. It is used as a marker dye, particularly in urological procedures, when it is given in a usual dose of 40 mg, preferably by intravenous injection but sometimes intramuscularly. It has also been used as a marker dye in amniocentesis.

Indigo carmine has been used as a blue dye in medicinal preparations but it is relatively unstable. It has also been investigated as a dye-spray in the detection of colorectal adenomas. It is used as a food colour.

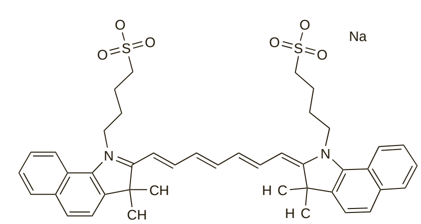
Preparations

USP 31: Indigotindisulfonate Sodium Injection.

Indocyanine Green

Verde de indocianina. Sodium 2-{7-[1,1-dimethyl-3-(4-sulphobutyl)benz[e]indolin-2-ylidene]hepta-1,3,5-trienyl}-1,1-dimethyl-1*H*-benz[e]indolio-3-(butyl-4-sulphonate).

$C_{43}H_{47}N_2NaO_6S_2$ = 775.0.
CAS — 3599-32-4.



Pharmacopoeias. In *Chin.* and *US.*

USP 31 (Indocyanine Green). An olive-brown, dark green, blue-green, dark blue, or black powder. Is odourless or has a slight odour. It contains not more than 5.0% of sodium iodide, calculated on the dried basis. Soluble in water and in methyl alcohol; practically insoluble in most other organic solvents. Its solutions are deep emerald-green in colour. pH of a 0.5% solution in water is about 6. Its aqueous solutions are stable for about 8 hours. Store at a temperature of 25°, excursions permitted between 15° and 30°.

Adverse Effects and Precautions

Indocyanine green is reported to be well tolerated. Anaphylaxis and urticaria have been reported. Solutions contain a small amount of sodium iodide and should be used with caution in patients hypersensitive to iodine. Clearance of indocyanine green may be altered by drugs that interfere with liver function.

◊ References.

1. Jackson TL. Indocyanine green accused. *Br J Ophthalmol* 2005; **89:** 395–6.
2. Cheng SN, *et al.* Ocular toxicity of intravitreal indocyanine green. *J Ocul Pharmacol Ther* 2005; **21:** 85–93.

Hypersensitivity. A report of anaphylactoid reactions to indocyanine green in 3 patients.[1] The authors commented that of 20 reactions that had been reported 9 involved anaphylactoid shock (with 2 subsequent deaths) and 11 involved hypotension or bronchospasm; they suggested that such reactions were dose-dependent and had a non-immune mechanism.

1. Speich R, *et al.* Anaphylactoid reactions after indocyanine-green administration. *Ann Intern Med* 1988; **109:** 345–6.

Pharmacokinetics

After intravenous injection indocyanine green is rapidly bound to plasma protein. It is taken up by the liver and is rapidly excreted unchanged into the bile.

Uses and Administration

Indocyanine green is an indicator dye used for assessing cardiac output and liver function, and for examining the choroidal vasculature in ophthalmic angiography. It is also used to assess blood flow and haemodynamics in various organs including the liver.

The usual dose for cardiac assessment is 5 mg injected rapidly via a cardiac catheter. A suggested dose for children is 2.5 mg, and for infants 1.25 mg. Several doses need to be given to obtain a number of dilution curves. However, the total dose should not exceed 2 mg/kg.

The usual dose of indocyanine green for testing liver function is 500 micrograms/kg given intravenously.

Diagnostic use. Indocyanine green has been used to assess blood flow to various organs and in other haemodynamic studies. However, some methods of determination of indocyanine green clearance as a measure of liver blood flow have been questioned on the grounds that extraction of the dye by the liver is not complete as is often assumed.[1] Interindividual variability in indocyanine clearance may introduce further error.[2]

There have been reports of the use of indocyanine green to assess cerebral blood flow in children during cardiopulmonary bypass[3] and to measure plasma volume in neonates.[4] In ophthalmology, indocyanine green angiography is used to visualise the choroidal circulation,[5,6] and as a stain during surgical repair of macular holes.[7,8]

Inhibin

Inhibina.

Ингибин

CAS — 57285-09-3.

NOTE. The name inhibin has also been used as a proprietary name for hydroquinine hydrobromide (p.2322).

Profile

Inhibin is a dimeric glycoprotein secreted by the testes and ovaries that suppresses secretion of follicle-stimulating hormone by the pituitary. As a member of the transforming growth factor-β family, it is also involved in mediation and regulation of many other physiological processes. Its two isoforms inhibin A and inhibin B have been widely investigated for their potential as markers of male infertility, ovarian cancer, and placental function. It has also been studied as a prognostic indicator of ovarian function in women undergoing assisted reproduction.

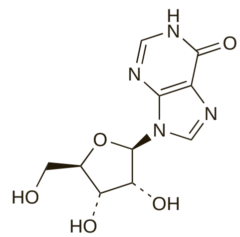
ATC Vet — QD06BB05; QG01AX02; QS01XA10.



Pharmacopoeias. In *Chin.*

Profile

Inosine has been used in the treatment of anaemias and cardiovascular, liver, and skin disorders and has been used as a tonic.

Preparations

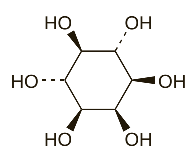
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Cz.:*** Laevadosin†; ***Ital.:*** Neo-Eparbiol†; ***Spain:*** Nutracel; Rubrocortin†.

Inositol

i-Inositol; *meso*-Inositol; Inositoli; Inositolum; *myo*-Inositolum; mio-Inozytol; myo-Inositol; myo-Inositoli; myo-Inositolum. *myo*-Inositol.

$C_6H_{12}O_6$ = 180.2.
CAS — 87-89-8.
ATC — A11HA07.
ATC Vet — QA11HA07.



Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (*myo*-Inositol). A white or almost white, crystalline powder. Very soluble in water; practically insoluble in alcohol.

USNF 26 (Inositol). A white or almost white, crystalline powder. Very soluble in water; practically insoluble in dehydrated alcohol and in ether.

Profile

Inositol, an isomer of glucose, has traditionally been considered to be a vitamin B substance although it has an uncertain status as a vitamin and a deficiency syndrome has not been identified in man. Sources of inositol include whole-grain cereals, fruits, and plants, in which it occurs as the hexaphosphate, fytic acid. It also occurs in both vegetables and meats in other forms. The usual daily intake of inositol from the diet is about 1 g. It is an ingredient of numerous vitamin preparations and dietary supplements, and of preparations promoted for a wide variety of disorders.

Inositol appears to be involved physiologically in lipid metabolism and has been tried, with little evidence of efficacy, in disorders associated with fat transport and metabolism. It has been investigated in the treatment of depression and anxiety, in diabetic neuropathy, and in neonatal respiratory distress syndrome and retinopathy of prematurity.

Neonatal respiratory distress syndrome. Inositol supplementation has been tried in premature infants with respiratory distress syndrome (p.1508). A meta-analysis[1] found that infants given inositol had improved survival and lower rates of bronchopulmonary dysplasia and retinopathy of prematurity than those given placebo.

1. Howlett A, Ohlsson A. Inositol for respiratory distress syndrome in preterm infants. Available in The Cochrane Database of Systematic Reviews; Issue 4. Chichester: John Wiley; 2003 (accessed 19/04/06).

Preparations

Interleukins

Интерлейкины

Profile

Interleukins are cytokines (p.2292) that are thought to target leukocytes. As with other cytokines, interleukins are involved in the regulation of normal immune and inflammatory responses and have both proinflammatory and anti-inflammatory actions. Interleukins used clinically include interleukin-1 (p.2325), interleukin-2 (p.735), and aldesleukin (recombinant interleukin-2) (p.735). Interleukins under investigation include interleukin-3 (p.1073), ilodecakin (recombinant interleukin-10) (p.2326), and edodekin alfa (recombinant interleukin-12) (p.2326).

Interleukins have also been implicated in the pathogenesis of some diseases, and inhibitors of interleukins or their receptors may therefore be of therapeutic value.

Antagonists acting against interleukin receptors used clinically include anakinra (recombinant interleukin-1 receptor antagonist) (p.19), basiliximab (p.1821), and daclizumab (p.1833), which are all interleukin-2 receptor antibodies, and tocilizumab (recombinant interleukin-6 receptor antibody) (p.2326) Inolimomab (p.1835) is an interleukin-2 receptor antibody under investigation.

Antibodies targeting interleukins have been developed and those under investigation include mepolizumab (recombinant interleukin-5 antibody) (p.743) and elsilimomab (recombinant interleukin-6 antibody) (p.2326).

Interleukin fusion toxins are produced by combining interleukin protein sequences with a bacterial toxin (e.g. diphtheria or pseudomonas) with the aim of inhibiting specific interleukin activity. Those under investigation include interleukin-2 fusion toxins (p.2326), interleukin-4 fusion toxins, and cintredekin besudotox, an interleukin-13 fusion toxin.

Soluble interleukin receptors may have therapeutic value and are also being tried therapeutically: rilonacept (p.2379) is an interleukin-1 blocker used in the treatment of a group of rare inherited auto-inflammatory disorders; interleukin-4 receptor is also being investigated.

Inhibitors of cysteine protease IL-1β converting enzyme (ICE) have been investigated as a means of reducing secretion of interleukin-1β (p.2325).

Interleukin-1

Catabolin; Endogenous Pyrogen; Haematopoietin-1; IL-1; Interleucina 1; Leucocyte Endogenous Mediator; Lymphocyte Activating Factor.

Интерлейкин-1

Profile

Interleukin-1 is one of a number of polypeptides known collectively as interleukins (p.2325). It is produced in blood and a variety of tissues by mononuclear phagocytes involved in the complex regulation of immune responses. It enhances the immune response and has proinflammatory and pyrogenic properties. There are two distinct forms, interleukin-1α and interleukin-1β.

Interleukin-1 may also be produced by recombinant DNA technology, and human recombinant interleukin-1β has been used as an adjunct to cancer chemotherapy or radiotherapy for its haematopoietic activity. It has also been investigated for its immunotropic effects in purulent infections of the lung and ear, although it has no intrinsic antibacterial activity. Adverse effects of interleukin-1 include fever, chills, flu-like symptoms, hypotension, and pain, swelling, and erythema at the site of subcutaneous injection.

Interleukin-1 is also implicated in the pathogenesis of some diseases, particularly auto-immune and inflammatory diseases such as rheumatoid arthritis and inflammatory bowel disease.

Preparations

Proprietary Preparations (details are given in Part 3)
Rus.: Betaleukin.

Interleukin-1 Receptor Antagonists

Antagonista del Receptor de la Interleucina 1; IL-1ra; IL-1i; Interleukin-1 Inhibitors.

Profile

Endogenous antagonists to interleukin-1 receptor block the actions of interleukin-1 (p.2325) and recombinant forms have been investigated in inflammatory and immune-modulated disorders.

Anakinra (p.19) is a human recombinant interleukin-1 receptor antagonist used in the treatment of rheumatoid arthritis.

Interleukin-2 Fusion Toxins

Toxinas de fusión de interleucina 2.

Profile

Interleukin-2 fusion toxin is produced by replacing the receptor binding domain of diphtheria toxin with sequences from interleukin-2, thus producing specific cytotoxicity in cells expressing the interleukin-2 receptor. The interleukin-2 fusion toxin denileukin diftitox (p.710) is used in the treatment of cutaneous T-cell lymphoma. The related compound DAB_{486} interleukin-2 has also been investigated in a variety of disorders.

Interleukin-6

B-cell Stimulatory Factor-2; BSF-2; Hepatocyte-Stimulating Factor; Hybridoma Growth Factor; IFN-β_2; IL-6; Interferon-β2.

Интерлейкин-6

Profile

Interleukin-6 is one of a number of polypeptides known collectively as interleukins (p.2325). It is produced by many cell types and induces differentiation of B-lymphocytes and activation of T-cells. It has proinflammatory and pyrogenic properties and is involved in the regulation of immune responses and inflammation. Interleukin-6 has also been implicated in haematopoiesis.

Atexakin alfa is human recombinant interleukin-6 under investigation.

Since overproduction of interleukin-6 plays a crucial role in the pathogenesis of chronic inflammatory diseases, interleukin-6 antibodies (p.2326) and interleukin-6 receptor antagonists (p.2326) are being investigated or used as therapeutic agents.

Interleukin-6 Antibodies

IL-6 Antibody.

Elsilimomab *(rINN)*

Elsilimomabum. Immunoglobulin G1, anti-(human interleukin 6) (mouse monoclonal B-E8 heavy chain), disulfide with mouse monoclonal B-E8 κ-chain, dimer.

Эльсилимомаб

CAS — 468715-71-1.

Profile

Monoclonal antibodies to interleukin-6 (p.2326) are under investigation for the treatment of disorders including post-transplant lymphoproliferative disorders and renal cell carcinoma.

Elsilimomab is an interleukin-6 monoclonal antibody under investigation.

Interleukin-6 Receptor Antagonists

Tocilizumab *(USAN, rINN)*

Atlizumab; MRA; R-1569; Tocilizumabum. Immunoglobulin G1, anti-(human interleukin 6 receptor) (human-mouse monoclonal MRA heavy chain), disulfide with human-mouse monoclonal MRA κ-chain, dimer.

Тоцилизумаб

CAS — 375823-41-9.

Profile

Antagonists to the interleukin-6 receptor block the actions of interleukin-6 (p.2326) and are under investigation for rheumatoid arthritis, systemic-onset juvenile idiopathic arthritis, adult-onset Still's disease, Crohn's disease, and haemolytic anaemia.

Tocilizumab is a recombinant monoclonal antibody that targets the interleukin-6 receptor and is used for the treatment of Castleman's disease, a rare lymphoproliferative disorder. It is also used for the treatment of rheumatoid arthritis and juvenile idiopathic arthritis.

Preparations

Proprietary Preparations (details are given in Part 3)
Jpn: Actemra.

Interleukin-10

CSIF; Cytokine synthesis inhibitory factor; IL-10.

Интерлейкин-10

CAS — 130068-27-8.

Ilodecakin *(USAN, rINN)*

Ilodecakina; Ilodécakine; Ilodecakinum; Interleukin-10 (human clone pH15C); rhIL-10; Sch-52000.

Илодекакин

CAS — 149824-15-7.

Profile

Interleukin-10 is one of a number of polypeptides known collectively as interleukins (p.2325). It regulates the differentiation and proliferation of several immune cells including T-cells and B-cells. It is postulated that it has immunostimulant as well as immunosuppressive properties; it also has anti-inflammatory actions. Interleukin-10 is under investigation for inflammatory bowel disease, malignant neoplasms, skin disorders including psoriasis and reduction of scarring, rheumatoid arthritis, hepatitis C, and organ transplantation.

Ilodecakin is a recombinant form of interleukin-10 under investigation.

Interleukin-12

IL-12.

Интерлейкин-12

Edodekin Alfa *(USAN, rINN)*

Edodekina alfa; Édodékine Alfa; Edodekinum Alfa; Ro-24-7472/000.

Эдодекин Альфа

CAS — 187348-17-0.

Description. A recombinant human interleukin-12.

Profile

Interleukin-12 is one of a number of polypeptides known collectively as interleukins (p.2325). It is produced by macrophages and dendritic cells and enhances cellular immunity through induction of the activity of interferon-γ and cytotoxic T-lymphocytes. It has been investigated for the treatment of severe infections such as mycobacterial infections; it is worthy of note that children with a rare inherited susceptibility to fatal mycobacterial infections exhibit mutations in the interleukin-12 gene. Interleukin-12 is also under study for the treatment of various cancers, including as adenovirus-mediated gene therapy.

Edodekin alfa is human recombinant interleukin-12 under investigation for the treatment of renal cell carcinoma.

Intrinsic Factor

Antianemic Factor; Castle's Intrinsic Factor; Gastric Intrinsic Factor.

Внутренне Присущий Фактор

CAS — 9008-12-2.

Profile

Intrinsic factor, a glycoprotein secreted by the parietal glands in the stomach, is required for absorption of vitamin B_{12} in the small intestine. Deficiency in intrinsic factor leads to vitamin B_{12} deficiency disorders and pernicious anaemia.

Intrinsic factor is given orally with cyanocobalamin in the Schilling test in the differential diagnosis of pernicious anaemia (see p.1981). It is also included in some oral preparations containing cyanocobalamin, presumably as an aid to absorption.

◊ Difficulty in obtaining intrinsic factor and/or radio-labelled cyanocobalamin for the original Schilling test prompted studies using a recombinant human intrinsic factor in a new vitamin B_{12} absorption test. Initial results with this recombinant form were promising.[1]

1. Hvas A-M, *et al.* The effect of recombinant human intrinsic factor on the uptake of vitamin B12 in patients with evident vitamin B12 deficiency. *Haematologica* 2006; **91:** 805–8.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Braz.:*** Hemofer†; ***Indon.:*** Biosanbe; ***Philipp.:*** TriHEMIC; ***USA:*** Anemagen†; Chromagen; Contrin; Ferotrinsic; Fetrin; Livitrinsic-f; Pronemia Hematinic; TriHEMIC; Trinsicon.

Inulin *(BAN)*

Alant Starch; Inulina.

CAS — 9005-80-5.

Pharmacopoeias. In *Br.* and *US.*

BP 2008 (Inulin). A polysaccharide obtained from the tubers of *Dahlia variabilis*, *Helianthus tuberosus*, and other genera of the family Compositae. It is a white, odourless or almost odourless, hygroscopic, amorphous, granular powder. Slightly soluble in cold water, but freely soluble in hot water; slightly soluble in organic solvents.

USP 31 (Inulin). A polysaccharide which, on hydrolysis, yields mainly fructose. A white, friable, chalk-like, amorphous, odourless powder. Soluble in hot water; slightly soluble in cold water and in organic solvents. A 10% solution in water has a pH of 4.5 to 7.0. Store at a temperature of 25°, excursions permitted between 15° and 30°.

Pharmacokinetics

Inulin is rapidly removed from the circulation after intravenous doses but is not metabolised. A trace may be found in the bile and may cross the placenta, but it is mainly eliminated in the urine by glomerular filtration without secretion or reabsorption in the renal tubule.

Uses and Administration

Inulin is used intravenously as a diagnostic agent to measure the glomerular filtration rate. Although an accurate test, it is complex to perform and is generally reserved for research purposes. Crystals of inulin may be deposited on storage of the injection; they should be dissolved by heating for not more than 15 minutes before use and the injection cooled to a suitable temperature before use.

Polyfructosan, an inulin analogue of lower average molecular weight, has been used similarly.

Preparations

BP 2008: Inulin Injection;
USP 31: Inulin in Sodium Chloride Injection.

Proprietary Preparations (details are given in Part 3)
Austria: Inutest; ***Cz.:*** Inutest†.

Multi-ingredient: ***Chile:*** Reduc-Te; Reducform-F; ***Fr.:*** Actyfilus; Effadiane relipidantes; ***Ital.:*** Enterolactis; Lactolas; Naturalass; Snell'it.

Iris Versicolor

Blue Flag; Iris Virginica.

Profile

The rhizomes of *Iris versicolor* (Iridaceae) are used in herbal preparations for skin and gastrointestinal disorders.

Homoeopathy. Iris versicolor has been used in homoeopathic medicines under the following names: Iris; Iris ver.

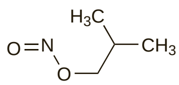
Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** Catarrh Mixture; HRI Clear Complexion; Skin Eruptions Mixture.

Isobutyl Nitrite

$C_4H_9NO_2$ = 103.1.
CAS — 542-56-3.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of isobutyl nitrite:
Aroma of men; Bolt; Bullet; Climax; Hardware; Krypt tonight; Locker room; Poppers; Quicksilver; Rush; Rush Snappers; Snappers; Thrust; White out; Whiteout.

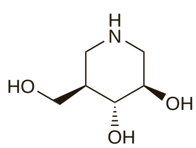
Profile

Isobutyl nitrite is not used medicinally but, as with other volatile nitrites, is abused for its vasodilating and related effects following inhalation (see Abuse, under Amyl Nitrite, p.1437).

Isofagomine

AT-2101 (tartrate). (3*R*,4*R*,5*R*)-3,4-Dihydroxy-5-(hydroxymethyl)piperidine.

$C_6H_{13}NO_3$ = 147.2.
CAS — 169105-89-9 (isofagomine); 161302-93-8 (isofagomine hydrochloride).



NOTE. The code AT-2101 has also been applied to a topical formulation of diclofenac in hyaluronic acid used in the treatment of actinic keratoses.

Profile

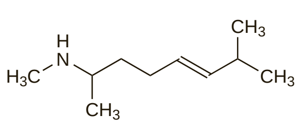
Isofagomine is an iminosugar under investigation as the tartrate for oral therapy of Gaucher disease (p.2249). It is a pharmacological chaperone that stabilises the variant lysosomal glucocerebrosidase facilitating its folding and transport from the endoplasmic reticulum into lysosomes, thereby increasing the pool of active endogenous enzyme.

Isometheptene Hydrochloride *(BANM, rINNM)* ⊗

Hidrocloruro de isometepteno; Isométheptène, Chlorhydrate d'; Isometheptení Hydrochloridum. 1,5,*N*-Trimethylhex-4-enylamine hydrochloride; 1,5-Dimethylhex-4-enyl(methyl)amine hydrochloride.

Изометептена Гидрохлорид

$C_9H_{19}N,HCl$ = 177.7.
CAS — 503-01-5 (isometheptene); 6168-86-1 (isometheptene hydrochloride).
ATC — A03AX10.
ATC Vet — QA03AX10.



(isometheptene)

Isometheptene Mucate *(BANM, rINNM)* ⊗

Isométheptène, Mucate d'; Isometheptení Mucas; Mucato de isometepteno. Isometheptene galactarate.

Изометептена Мукат

$(C_9H_{19}N)_2,C_6H_{10}O_8$ = 492.6.
CAS — 7492-31-1.
ATC — A03AX10.
ATC Vet — QA03AX10.

Pharmacopoeias. In *Br.* and *US.*

BP 2008 (Isometheptene Mucate). A white crystalline powder. Very soluble in water; slightly soluble in dehydrated alcohol; very slightly soluble in chloroform; practically insoluble in ether. A 5% solution in water has a pH of 5.4 to 6.6. Store in airtight containers. Protect from light.

USP 31 (Isometheptene Mucate). A white crystalline powder. Freely soluble in water; soluble in alcohol; practically insoluble in chloroform and in ether. pH of a 5% solution in water is between 6.0 and 7.5.

Adverse Effects and Precautions

As for Sympathomimetics, p.1407.

Porphyria. Isometheptene mucate has been associated with acute attacks of porphyria and is considered unsafe in porphyric patients.

Interactions

As for Sympathomimetics, p.1407. Isometheptene has been reported to produce severe hypertensive reactions in patients receiving MAOIs.

Bromocriptine. For a report of hypertension and life-threatening complications after use of isometheptene and *bromocriptine*, see under Sympathomimetics, p.800.

Uses and Administration

Isometheptene is an indirect-acting sympathomimetic (p.1408). It is included for its vasoconstrictor effect, usually as the mucate, in some analgesic combination products used to treat acute migraine attacks (p.616). Typical oral doses of isometheptene mucate in migraine are 130 mg at the beginning of an attack, with 65 mg hourly thereafter as necessary, up to a total maximum dose of 325 mg in a 12-hour period.

Isometheptene hydrochloride has also been used in the management of migraine and smooth muscle spasm; it has been given orally, as well as by intramuscular, or occasionally subcutaneous, or slow intravenous, injection. The mucate has also been used in the management of muscle spasms.

Preparations

USP 31: Isometheptene Mucate, Dichloralphenazone, and Acetaminophen Capsules.

Proprietary Preparations (details are given in Part 3)
Turk.: Octinum.

Multi-ingredient: ***Braz.:*** Cefaldina; Doralgina; Doridina; Dorsedin; Migranette; Neomigran†; Neosaldina; Neuralgina; Sedalgina; Sedol; Tensaldin; ***Hong Kong:*** Midrid†; ***UK:*** Midrid; ***USA:*** Duradrin†; Midrin; MigraTen; Migratine†.

Isospaglumic Acid *(rINN)*

Acide Isospaglumique; Ácido isospaglúmico; Acidum Isospaglumicum; NAAGA. *N*-(*N*-Acetyl-L-α-aspartyl)-L-glutamic acid.

Изоспаглумовая Кислота

$C_{11}H_{16}N_2O_8$ = 304.3.
CAS — 3106-85-2.

Spaglumic Acid *(rINN)*

Acide Spaglumique; Ácido espaglúmico; Acidum Spaglumicum. *N*-(*N*-Acetyl-L-β-aspartyl)-L-glutamic acid.

Спаглумовая Кислота

CAS — 4910-46-7.
ATC — R01AC05; S01GX03.
ATC Vet — QR01AC05; QS01GX03.

Profile

N-Acetyl-L-aspartylglutamate is a mast cell stabiliser and has been used as the sodium or magnesium salts of spaglumic or isospaglumic acids in eye drops for allergic eye conditions and in nasal solutions for allergic rhinitis.

N-Acetyl-L-aspartylglutamate also has a role as a neurotransmitter and has been investigated in CNS disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: Naabak; ***Austria:*** Rhinaaxia; ***Braz.:*** Naabak; Naaxia; ***Chile:*** Alerbak; Naaxia; ***Cz.:*** Naaxia†; ***Fr.:*** Naabak; Naaxia; Naaxiafree; Rhinaaxia; ***Gr.:*** Rhinaaxia†; ***Hong Kong:*** Naaxia; ***Hung.:*** Naaxia; Rhinaaxia†; ***Ital.:*** Naaxia; Rhinaaxia; ***Philipp.:*** Naaxia; ***Port.:*** Naabak; Naaxia†; ***Singapore:*** Naabak; ***Spain:*** Naaxia; ***Switz.:*** Rhinaaxia†; ***Turk.:*** Naaxia; ***Venez.:*** Naabak.

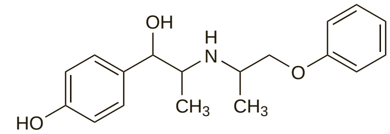
Multi-ingredient: ***Gr.:*** Naaxia; ***S.Afr.:*** Naaxia†; ***Switz.:*** Naaxia.

Isoxsuprine Hydrochloride *(BANM, rINNM)*

Caa-40; Hidrocloruro de isoxsuprina; Isoksupriinihydrokloridi; Isoxsuprin hydrochlorid; Isoxsuprine, chlorhydrate d'; Isoxsuprinhydroklorid; Isoxsuprini hydrochloridum; Izoksuprino hidrochloridas; Izoxszuprin-hidroklorid; Phenoxyisopropylnorsuprifen. 1-(4-Hydroxyphenyl)-2-(1-methyl-2-phenoxyethylamino)propan-1-ol hydrochloride.

Изоксуприна Гидрохлорид

$C_{18}H_{23}NO_3,HCl$ = 337.8.
CAS — 395-28-8 (isoxsuprine); 579-56-6 (isoxsuprine hydrochloride).
ATC — C04AA01.
ATC Vet — QC04AA01.



(isoxsuprine)

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Isoxsuprine Hydrochloride). A white or almost white crystalline powder. Sparingly soluble in water and in alcohol; practically insoluble in dichloromethane. A 1% solution in water has a pH of 4.5 to 6.0. Protect from light.

USP 31 (Isoxsuprine Hydrochloride). A white, odourless, crystalline powder. Soluble 1 in 500 of water, 1 in 100 of alcohol and of 0.1N sodium hydroxide solution, and 1 in 2500 of 0.1N hydrochloric acid; practically insoluble in chloroform and in ether. pH of a 1% solution in water is between 4.5 and 6.0. Store in airtight containers.

Adverse Effects

Isoxsuprine may cause transient flushing, hypotension, tachycardia, rashes, and gastrointestinal disturbances. Maternal pulmonary oedema and fetal tachycardia have been reported after intravenous use in premature labour.

Pulmonary oedema. Pulmonary oedema has been reported in mothers given isoxsuprine for premature labour.[1,2]

1. Nagey DA, Crenshaw MC. Pulmonary complications of isoxsuprine therapy in the gravida. *Obstet Gynecol* 1982; **59** (suppl): 38S–42S.
2. Nimrod C, *et al.* Pulmonary edema associated with isoxsuprine therapy. *Am J Obstet Gynecol* 1984; **148:** 625–9.

Precautions

Isoxsuprine is contra-indicated after recent arterial haemorrhage. It should not be given immediately post partum, nor should it be used for premature labour if there is infection.

In women being treated for premature labour, the risk of pulmonary oedema means that extreme caution is required and the precautions and risk factors discussed under Salbutamol Sulfate, p.1132, apply.

Pregnancy. Ileus was found to be more common in the offspring of mothers who received isoxsuprine than in matched controls.[1] The incidence of respiratory distress syndrome also rose as the isoxsuprine concentration in cord blood exceeded 10 nanograms/mL; likewise the incidence of hypocalcaemia and hypotension rose progressively with increasing concentrations. The cord concentrations correlated inversely with the drug-free interval before delivery and it was suggested that with frequent assessment of uterine response it should be possible to avoid delivering infants at a time when they have high plasma-isoxsuprine concentrations.[1]

In another study[2] of the association between ruptured membranes, beta-adrenergic therapy, and respiratory distress syndrome, it was found that both therapy with isoxsuprine and premature rupture of membranes were individually associated with a lowered incidence of respiratory distress syndrome, but when present together they resulted in an increased risk of respiratory distress syndrome. It was suggested that therapy with beta-adrenergic drugs including isoxsuprine should be restricted to patients with intact membranes.[1]

1. Brazy JE, *et al.* Isoxsuprine in the perinatal period II: relationships between neonatal symptoms, drug exposure, and drug concentration at the time of birth. *J Pediatr* 1981; **98:** 146–51.
2. Curet LB, *et al.* Association between ruptured membranes, tocolytic therapy, and respiratory distress syndrome. *Am J Obstet Gynecol* 1984; **148:** 263–8.

Pharmacokinetics

Isoxsuprine hydrochloride is well absorbed from the gastrointestinal tract. The peak plasma concentration occurs about 1 hour after an oral dose. A plasma half-life of about 1.5 hours has been reported. Isoxsuprine is excreted in the urine mainly as conjugates.

Uses and Administration

Isoxsuprine is a vasodilator that also stimulates beta-adrenergic receptors. It causes direct relaxation of vascular and uterine smooth muscle and its vasodilating action is greater on the arteries supplying skeletal muscles than on those supplying skin. Isoxsuprine also produces positive inotropic and chronotropic effects.

Isoxsuprine hydrochloride has been used to arrest premature labour (p.2003), but drugs with a more selective action are now preferred. It has also been given in the treatment of cerebral and peripheral vascular disease.

For use as a vasodilator, isoxsuprine hydrochloride is given by mouth in doses of 10 to 20 mg 3 or 4 times daily.

To arrest premature labour, isoxsuprine hydrochloride is given initially by intravenous infusion in doses of 200 to 500 micrograms/minute, adjusted according to the patient's response, until control is achieved. It is now common practice to give beta agonists by syringe pump when using them to delay premature labour. Maternal blood pressure and hydration, and maternal and fetal heart rates should be monitored during the infusion. Once labour has been arrested intramuscular injections of 10 mg are given every 3 to 8 hours for several days. Prophylaxis may be continued by mouth with 30 to 90 mg daily in divided doses.

The resinate has also been used similarly.

Preparations

USP 31: Isoxsuprine Hydrochloride Injection; Isoxsuprine Hydrochloride Tablets.

Proprietary Preparations (details are given in Part 3)

Arg.: Duvadilan; Fadaespasmol†; Isodilan; Isotenk; Samaruc; Uterine; ***Austria:*** Xuprin; ***Braz.:*** Inibina; ***Gr.:*** Duvadilan†; ***India:*** Duvadilan; ***Indon.:*** Duvadilan; Hystolan; ***Israel:*** Vasolan†; ***Ital.:*** Vasosuprina Ilfi; ***Mex.:*** Vadosilan; ***Philipp.:*** Duvadilan; Isoxilan; ***Port.:*** Dilum; ***Thai.:*** Duvadilan†; ***USA:*** Vasodilan; Voxsuprine; ***Venez.:*** Duvadilan.

Ivy

Břečťanový list (ivy leaf); Efeu; Gebenių lapai (ivy leaf); Hederae folium (ivy leaf); Herba Hederae Helicis; Lierre, feuille de (ivy leaf); Lierre Grimpant; Muratinlehti (ivy leaf); Murgröneblad (ivy leaf).

Pharmacopoeias. *Eur.* (see p.vii) includes the leaf and also a form for homoeopathic preparations.

Ph. Eur. 6.2 (Ivy Leaf; Hederae Folium). The whole or cut, dried leaves of *Hedera helix*, collected in the spring. It contains a minimum of 3% of hederacoside C ($C_{59}H_{96}O_{26}$ = 1221.4), calculated with reference to the dried drug. Protect from light.

Ph. Eur. 6.2 (Hedera Helix for Homoeopathic Preparations; Hedera Helix ad Praeparationes Homoeopathicas). The fresh, young, fully developed but not yet lignified branch of *Hedera helix*, harvested immediately before or at the beginning of flowering. Protect from light.

Profile

The dried leaves of ivy, *Hedera helix* (Araliaceae), contain saponins, and extracts are reported to have expectorant and spasmolytic actions. Ivy leaf is used for catarrh and chronic inflammation of the respiratory tract. It has also been applied externally.

Fresh ivy leaves can cause allergic contact dermatitis.

Homoeopathy. Ivy has been used in homoeopathic medicines under the following names: Hedera helix; Hed. hel.

Jin Bu Huan

Profile

Jin bu huan is a traditional Chinese remedy used as a sedative and analgesic and variously stated to contain *Lycopodium serratum* or *Polygala chinensis*. Adverse effects including CNS depression and acute hepatotoxicity have been attributed to its alkaloidal content of L-tetrahydropalmatine.

Adverse effects. Acute hepatitis has been reported in 7 previously healthy patients after taking jin bu huan; symptoms occurred again in 2 after re-use.[1] It was noted that the content of plant material did not seem to correspond to the labelled species. Hepatitis and extreme fatigue have also been reported in 3 adults after taking jin bu huan for periods ranging from 6 days to 6 months.[2]

Accidental ingestion of jin bu huan by 3 children[2] produced profound lethargy and muscle weakness. Two of the children also developed respiratory depression and bradycardia.

Juniper

Baccae Juniperi; Boróka tobozbogyó; Enbär; Enebro; Genièvre; Iuniperi pseudo-fructus; Jalovcový plod; Juniper Berry; Juniper Fruit; Juniperi Fructus; Juniperi Galbulus; Juniperi Pseudo-fructus; Kadagių vaisiai; Katajanmarja; Szyszkojagoda jałowca; Wacholderbeeren; Zimbro.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Juniper). The dried ripe cone berry of *Juniperus communis*. It contains not less than 1% v/w of essential oil, calculated with reference to the anhydrous drug. It has a strongly aromatic odour, especially if crushed. Protect from light.

Profile

Juniper is the source of juniper oil (below). It has carminative, diuretic, antiseptic, and anti-inflammatory properties. It is used in herbal medicine and as a flavour in gin.

Homoeopathy. Juniper has been used in homoeopathic medicines under the following names: Juniperus communis; Juniperus communis sicc.; Juniperus communis e fructibus siccatis; Junip. c.

Preparations

Proprietary Preparations (details are given in Part 3)

Cz.: Plod Jalovce†.

Juniper Oil

Borókaolaj; Enbärsolja; Enebro, aceite esencial de; Essence de Genièvre; Genièvre, huile essentielle de; Iuniperi aetheroleum; Jalovcová silice; Juniper Berry Oil; Juniperi Aetheroleum; Juniperi Etheroleum; Kadagių vaisių eterinis aliejus; Katajanmarjaöljy; Oleum Juniperi; Wacholderöl.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Juniper Oil). The essential oil obtained by steam distillation from the ripe, non-fermented berry cones of *Juniperus communis*. A suitable antoxidant may be added. A mobile, colourless to yellowish liquid with a characteristic odour. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

Profile

Juniper oil has been used as a carminative and as an ingredient of herbal remedies for urinary-tract disorders and muscle and joint pain. It is also used in aromatherapy. Prolonged use may cause gastrointestinal irritation and there may be a risk of renal damage from high doses.

Preparations

Proprietary Preparations (details are given in Part 3)

Ger.: Caprisana†; Leukona-Stoffwechsel-Bad†; Roleca Wacholder.

Kallidinogenase *(BAN, rINN)*

Callicrein; Kalidinogenasa; Kalléone; Kallidinogenaasi; Kallidinogenas; Kallidinogénase; Kallidinogenasum; Kallikrein.

Каллидиногеназа

CAS — 9001-01-8.
ATC — C04AF01.
ATC Vet — QC04AF01.

Pharmacopoeias. In *Jpn.*

Profile

Kallidinogenase is an enzyme isolated from the pancreas and urine of mammals. It converts kininogen into the kinin, kallidin. Kallidinogenase has been used in male infertility (p.2080) since the kallikrein-kinin system has a physiological role in the male genital tract. It also has vasodilating properties and has been used in the treatment of peripheral vascular disease (p.1178).

Preparations

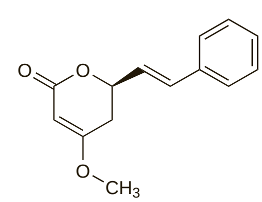
Proprietary Preparations (details are given in Part 3)

Austria: Padutin.

Kava

Kava-Kava.

CAS — 500-64-1 (kawain); 495-85-2 (methysticin); 500-62-9 (yangonin).



(kawain)

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of kava:
'ava; 'awa; Grog; Kawa; Lewena; Sakau; Waka; Wati; Yaqona.

Profile

Kava is the rhizome of *Piper methysticum* (Piperaceae), a shrub indigenous to islands of the South Pacific. It contains pyrones including kawain, methysticin, and yangonin. Kava has been used in the South Pacific to produce an intoxicating beverage used for recreational purposes and during convalescence. It is reported to have sedative, skeletal muscle relaxant, and anaesthetic properties. It is given in some anxiety- and stress-related disorders. It was formerly used as an antiseptic and diuretic in inflammatory conditions of the genito-urinary tract in the form of a liquid extract. Kawain has also been used for nervous disorders and as a tonic.

A characteristic rash resembling that of pellagra occurs in some heavy consumers of kava. Extrapyramidal effects and cases of hepatitis have been reported. Preparations of kava for internal use have been withdrawn in the UK and some other western countries on account of its potential for serious hepatotoxic effects.

Homoeopathy. Kava has been used in homoeopathic medicines under the following names: Piper methysticum; Piper. m.

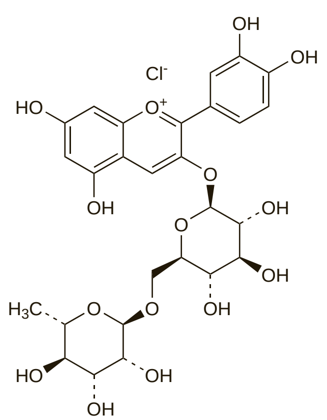
Keracyanin *(rINN)*

Cyaninoside; Keracianina; Kéracyanine; Keracyaninum. 3-[6-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyloxy]-3′,4′,5,7-tetrahydroxyflavylium chloride.

Керацианин

$C_{27}H_{31}ClO_{15}$ = 631.0.
CAS — 18719-76-1.



Profile

Keracyanin is claimed to improve visual function in poor light conditions and has been given orally in vision disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Meralop†; ***Spain:*** Meralop†.

Keratinase

Queratinasa.
CAS — 9025-41-6.

Profile

Keratinase is a proteolytic enzyme that has been obtained from cultures of *Streptomyces fradiae*. It can digest keratin, which is resistant to most proteolytic enzymes, in the presence of trace amounts of metal ions. It is used in the commercial separation of hair from animal hides, and has been tried as a depilatory; it has also been included in some topical antibacterial ointments, presumably to aid penetration of the active substances.

Kinkeliba

Combreti Folium; Kinkéliba.

Pharmacopoeias. In *Fr.*

Profile

Kinkeliba is the dried leaves of *Combretum micranthum* (*C. altum*; *C. raimbaultii*) (Combretaceae), a shrub indigenous to West Africa. It has been used as an ingredient of herbal remedies given for the treatment of biliary, liver, and gastrointestinal disorders. Other species of *Combretum* are also used.

Homoeopathy. Kinkeliba has been used in homoeopathic medicines.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Fr.:*** Hepaclem; Hepax; Jecopeptol; Mediflor Tisane Hepatique No 5; Romarene; Solution Stago Diluee; ***Mon.:*** Romarinex; ***Switz.:*** Bilifuge.

Klebsiella Pneumoniae Glycoprotein

Glucoproteína de Klebsiella pneumoniae; RU-41740.

Profile

Klebsiella pneumoniae glycoprotein is an immunostimulant that has been used in the management of respiratory-tract infections, wounds, and burns.

Preparations

Proprietary Preparations (details are given in Part 3)
Braz.: Biostim; ***Cz.:*** Biostim; ***Fr.:*** Biostim†; ***Ital.:*** Acintor; Biostim; ***Mex.:*** Biostim; ***Port.:*** Biostim†.

Knotgrass

Knotweed; Nat' rdesna ptačího; Pihatatar; Polygoni avicularis herba; Renouée des oiseaux; Takažolių žolė; Trampgräs; Vogelknöterichkraut; Ziele rdestu ptasiego.

Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii).

Ph. Eur. 6.2 (Knotgrass; Polygoni Avicularis Herba). It consists of the whole or cut, dried aerial parts of *Polygonum aviculare*. It contains not less than 0.3% of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$ = 464.4) calculated with reference to the dried drug. Protect from light.

Profile

Knotgrass, *Polygonum aviculare* (*P. heterophyllum*) (Polygonaceae), is included in herbal preparations for mild catarrh and associated upper respiratory-tract disorders.

Homoeopathy. Knotgrass has been used in homoeopathic medicines under the following names: Polygonum aviculare.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Cz.:*** Pulmoran; Species Urologicae Planta; ***Pol.:*** Cholesol; Reumosol.

Krebiozen

Crebiocén.

Кребиозен

CAS — 9008-19-9.

Profile

Krebiozen is the name of a preparation that was formerly promoted as a 'cancer cure' in the USA, but totally discredited by the FDA. It was stated to be obtained from the blood of horses previously injected with an extract of *Actinomyces bovis*.

Kveim Antigen

Antígeno de Kveim.

Profile

Kveim antigen is a fine suspension in physiological saline of sarcoid tissue prepared from spleens taken from patients with active sarcoidosis. It is used as an intradermal injection in the Kveim (Kveim-Siltzbach) test for the diagnosis of sarcoidosis (p.1512).

◊ References.

1. James DG, Williams WJ. Kveim-Siltzbach test revisited. *Sarcoidosis* 1991; **8:** 6–9.

◊ The safety of the Kveim test has been questioned, particularly with reference to the risk of transmission of sarcoidosis, and of hepatitis B, HIV, and Creutzfeldt-Jakob disease.[1] However, the procedure to identify acceptable sarcoid spleens and the method of preparation were considered sufficient to reduce the risk of transmission of infections[2] and of Creutzfeldt-Jakob disease.[3]

Laburnum

Golden Chain; Golden Rain; Lluvia de oro.

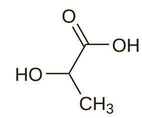
Profile

All parts of laburnum, *Laburnum anagyroides* (*L. vulgare*; *Cytisus laburnum*) (Leguminosae), are toxic. The toxic principle is cytisine (p.2291) which has actions similar to nicotine.

Lactic Acid

Acide lactique; Acidum lacticum; E270; E326 (potassium lactate); Kwas mlekowy; Kyselina mléčná; Láctico, ácido; Laktik Asit; Maitohappo; Milchsäure; Mjölksyra; Pieno rūgštis; Tejsav. 2-Hydroxypropionic acid; 2-Hydroxypropanoic acid.

$C_3H_6O_3$ = 90.08.
CAS — 50-21-5; 79-33-4 ((+)-lactic acid); 10326-41-7 ((−)-lactic acid); 598-82-3 ((±)-lactic acid).
ATC — G01AD01.
ATC Vet — QG01AD01; QP53AG02.



Pharmacopoeias. In *Chin.*, *Int.*, *Jpn*, and *US*.
Eur. (see p.vii) includes monographs for the racemate and the (*S*)-enantiomer.

Ph. Eur. 6.2 (Lactic Acid). A mixture of lactic acid, its condensation products, such as lactoyl-lactic acid and other polylactic acids, and water. The equilibrium between lactic acid and polylactic acids depends on the concentration and temperature. It is usually the racemate (*RS*-lactic acid), and contains the equivalent of 88 to 92% w/w of $C_3H_6O_3$. A colourless or slightly yellow, syrupy liquid. Miscible with water and with alcohol.

Ph. Eur. 6.2 ((*S*)-Lactic Acid). A mixture of (*S*)-lactic acid, its condensation products, such as lactoyl-lactic acid and other polylactic acids, and water. The equilibrium between lactic acid and polylactic acids depends on the concentration and temperature. It contains the equivalent of 88 to 92% w/w of $C_3H_6O_3$, of which not less than 95% is the (*S*)-enantiomer. A colourless or slightly yellow, syrupy liquid. Miscible with water and with alcohol.

USP 31 (Lactic Acid). A mixture of lactic acid and lactic acid lactate equivalent to a total of 88 to 92% w/w of $C_3H_6O_3$. It is obtained by the lactic fermentation of sugars or is prepared synthetically. Lactic acid obtained by fermentation of sugars is laevorotatory, while that prepared synthetically is racemic.

A colourless or yellowish, hygroscopic, practically odourless, syrupy liquid. When it is concentrated by boiling, lactic acid lactate is formed. Miscible with water, with alcohol, and with ether; insoluble in chloroform. Store in airtight containers.

Adverse Effects and Treatment

As for Hydrochloric Acid, p.2322, although in the concentrations used it is less corrosive.

Neonates. There was evidence that neonates had difficulty in metabolising *R*-(−)-lactic acid and this isomer and the racemate should not be used in foods for infants less than 3 months old.[1]

1. FAO/WHO. Toxicological evaluation of certain food additives with a review of general principles and of specifications: seventeenth report of the joint FAO/WHO expert committee on food additives. *WHO Tech Rep Ser 539* 1974.

Uses and Administration

Lactic acid has actions similar to those of acetic acid (p.2244) and has been used similarly in the treatment of infective skin and vaginal disorders. It has been used in the preparation of lactate injections and infusions to provide a source of bicarbonate for the treatment of metabolic acidosis (for the problems of using lactate in metabolic acidosis, see p.1667). It is also applied topically in the treatment of warts (p.1584), often with salicylic acid, and in emollient creams. Other uses include the treatment of severe aphthous stomatitis in terminally ill, immunocompromised patients.

Lactic acid has also been used as a food preservative and as an ingredient of cosmetics.

Preparations

BP 2008: Lactic Acid Pessaries;
USP 31: Compound Clioquinol Topical Powder.

Proprietary Preparations (details are given in Part 3)

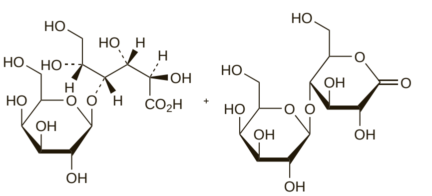
Lactobionic Acid

Acide Lactobionique; Acidum lactobionicum; Kwas laktobionowy; Kyselina laktobionová; Laktobionihappo; Laktobiono rūgštis; Laktobionsyra.

CAS — 96-82-2 (4-O-β-D-galactopyranosylD-gluconic acid).



Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Lactobionic Acid). A mixture in variable proportions of 4-*O*-β-D-galactopyranosyl-D-gluconic acid ($C_{12}H_{22}O_{12}$ = 358.3) and 4-*O*-β-D-galactopyranosyl-D-glucono-1,5-lactone ($C_{12}H_{20}O_{11}$ = 340.3). A white or almost white powder. Freely soluble in water; slightly soluble in anhydrous ethanol, methyl alcohol, and glacial acetic acid.

Profile

Lactobionic acid is used to form water-soluble salts of drugs such as calcium and the macrolide antibacterials clarithromycin and erythromycin. It is present, in the form of potassium lactobionate, in preservation fluids such as UW (University of Wisconsin) solution for organ transplantation; the lactobionate anion acts as an impermeant and provides an osmotic force to oppose cellular oedema in the stored organ. Lactobionic acid has similar properties to gluconic acid (p.2313) and is being tried in skin care products.

Lactoferrin

Lactotransferrin; rhLF (talactoferrin alfa).

CAS — 308240-58-6 (talactoferrin alfa).

Profile

Lactoferrin is an iron-binding protein found in milk, saliva, and other exocrine secretions. It has antimicrobial actions and has been used in preparations for the management of dry mouth (p.2140) and other mouth disorders.

Lactoferrin and other whey proteins have also been used as nutritional supplements. Recombinant forms of lactoferrin such as talactoferrin alfa are under investigation.

◊ Reviews.

Preparations

Proprietary Preparations (details are given in Part 3)

Austral.: Immune Boost; ImmunoDefence; ***Ital.:*** Endvir Simplex.

Multi-ingredient: ***Indon.:*** Laktobion; ***Ital.:*** Liverton; Nepiros; Rivuclin; ***Singapore:*** Biotene; ***UK:*** Biotene Dry Mouth; BioXtra†; ***USA:*** Biotene with Calcium.

Lactoperoxidase

CAS — 9003-99-0.

Profile

Lactoperoxidase is a peroxidase enzyme that is present in milk and saliva. It reacts with hydrogen peroxide and thiocyanate to produce an antibacterial effect and has been used in preparations for the management of dry mouth (p.2140) and other mouth disorders. It has also been used for its preservative action in cosmetics and skin-care products.

In the lactoperoxidase system for milk preservation, sodium thiocyanate and sodium percarbonate (a source of hydrogen peroxide) are added to fresh bovine milk to activate the lactoperoxidase it contains.

◊ Reviews.

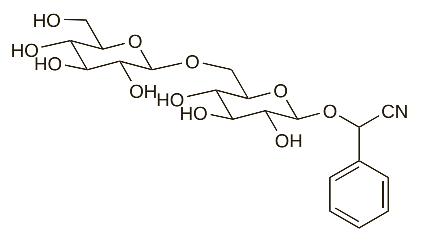
Laetrile

CAS — 1332-94-1 (laetrile); 29883-15-6 (amygdalin).



(amygdalin)

Profile

Laetrile is the term used for a product consisting chiefly of amygdalin, which is the major cyanogenic glycoside of apricot kernels. Amygdalin is *R*-α-cyanobenzyl-6-*O*-β-D-glucopyranosyl-β-D-glucopyranoside ($C_{20}H_{27}NO_{11}$ = 457.4). Laetrile is also used as a term for *R*-α-cyanobenzyl-6-*O*-β-D-glucopyranosiduronic acid ($C_{14}H_{15}NO_7$ = 309.3).

Laetrile was claimed to be preferentially hydrolysed in cancer cells by β-glucosidases to benzaldehyde and hydrogen cyanide, which killed the cell, but amygdalin does not appear to be absorbed from the gastrointestinal tract, and both normal and malignant cells contain only traces of β-glucosidases. Laetrile has also been claimed to be 'vitamin B_{17}', the deficiency of which is said to result in cancer; there is no evidence for this view and laetrile is of no known value in human nutrition.

There have been several reports of cyanide poisoning and other adverse reactions associated with the use of laetrile, especially when taken orally.

◊ A systematic review[1] concluded that data from controlled studies do not support the claims of efficacy for laetrile in cancer patients. Further references[2-4] to laetrile, including case reports[3,4] of toxic effects.

Laminaria

Stipites Laminariae; Styli Laminariae; Thallus Eckloniae; Thallus Laminariae.

Pharmacopoeias. In *Chin.*

Profile

Laminaria is the dried stalks of the seaweeds *Laminaria japonica*, *L. digitata*, and possibly other species of *Laminaria*. The stalks swell in water to about 6 times their volume and have been used surgically to dilate cavities and to dilate the cervix in labour or abortion induction.

An extract of various species of *Laminaria* has been used as a dietary supplement (see Seaweeds, Kelps, and Wracks, p.2384).

Adverse effects. Anaphylaxis[1-3] and toxic shock syndrome[4] have been reported after the insertion of laminaria for cervical dilatation.

1. Nguyen MT, Hoffman DR. Anaphylaxis to laminaria. *J Allergy Clin Immunol* 1995; **95:** 138–9.

Preparations

Proprietary Preparations (details are given in Part 3)

Rus.: Okovidit (Оковидит).

Multi-ingredient: ***Fr.:*** Marinol; ***Spain:*** Fucusor†.

Lappa

Bardana; Bardanae Radix; Bardane (Grande); Burdock; Burdock Root; Lappa Root.

Pharmacopoeias. In *Fr.*

Chin. and *Jpn* include the fruits.

Profile

Lappa is the dried root of the great burdock, *Arctium lappa* (*A. majus*), and other species of *Arctium* (Compositae). It was formerly used in the form of a decoction as a diuretic and diaphoretic but there is little evidence of its efficacy. Herbal preparations containing lappa have been used in the treatment of skin, musculoskeletal, and gastrointestinal disorders. The leaves and fruits of *Arctium* spp. have also been used.

Homoeopathy. Lappa has been used in homoeopathic medicines under the following names: Lappa major; Lap. maj.

Preparations

Laronidase (USAN, rINN)

Alpha-L-iduronidase; Alronidase; Laronidasa; Laronidasum; Laronidaz. 8-L-Histidine-α-L-iduronidase (human).

Ларонидаз

CAS — 210589-09-6.
ATC — A16AB05.
ATC Vet — QA16AB05.

Adverse Effects, Treatment, and Precautions

Anaphylactic and other infusion reactions, sometimes delayed in onset, have been reported in patients given laronidase and facilities for resuscitation should be available whenever laronidase is used. Common symptoms include flushing, fever, headache, and rash; bronchospasm has also been reported. Other adverse effects commonly reported include abdominal pain, arthralgia, back pain, nausea, vomiting, diarrhoea, cough, dyspnoea, urticaria, angioedema, pruritus, chills, paraesthesia, dizziness, tachycardia, increased blood pressure, and decreased oxygen saturation. Patients with existing respiratory disease may be at risk of more severe reactions. Antihistamines and/or antipyretics (e.g. paracetamol or ibuprofen) may relieve symptoms. A reduction in the rate of infusion to half the rate at which the reaction occurred should also be considered for mild or moderate reactions; for severe reactions, the infusion should be stopped until symptoms have subsided, and then restarted at one-half to one-quarter the rate at which the reaction occurred. Adrenaline should be used with caution because there is a greater incidence of coronary artery disease in patients with mucopolysaccharidosis I. Pre-treatment with antihistamines and/or antipyretics about 60 minutes before infusion is recommended to prevent reactions. IgG antibodies to laronidase are expected to develop within 3 months of starting treatment in the majority of patients, although the effect of this on safety and efficacy is not clear. However, such patients may be at increased risk of hypersensitivity reactions and should be treated with caution. Injection site reactions have also been reported.

Interactions

Licensed product information for laronidase recommends that it should not be given with chloroquine or procaine because of the potential risk of interference with the intracellular uptake of the enzyme.

Uses and Administration

Laronidase is recombinant human α-L-iduronidase and is used as enzyme replacement therapy for the treatment of the non-neurological manifestations of mucopolysaccharidosis I (see below). It is given by intravenous infusion in a dose of 100 units/kg each week. The initial infusion rate should be 2 units/kg per hour, increased every 15 minutes during the first hour, as tolerated, to a maximum of 43 units/kg per hour such that the infusion is completed in about 3 to 4 hours (but see also under Adverse Effects, Treatment, and Precautions, above). In some countries, the dose is expressed as mg/kg: 100 units is equivalent to about 580 micrograms of laronidase.

Mucopolysaccharidosis I. Mucopolysaccharidosis I is a progressive disorder characterised by deficiency of the enzyme α-L-iduronidase, which is necessary to catalyse the hydrolysis of terminal α-L-iduronic residues of the glycosaminoglycans, dermatan sulfate and heparan sulfate. This results in their accumulation in tissues, with many clinical manifestations including hepatomegaly, skeletal abnormalities, pulmonary disease, eye disease, and progressive deterioration of the CNS. Mucopolysaccharidosis I has traditionally been classified into three main forms based on clinical symptoms and severity: Hurler syndrome, Hurler-Scheie syndrome, and Scheie syndrome. Hurler syndrome is the most severe form with a life expectancy of less than 10 years. However, there is a degree of overlap between the syndromes and they are indistinguishable by routine enzyme or urine tests.

Treatment was previously limited to symptomatic management but other options to halt disease progression are now available. Haematopoietic stem-cell transplantation using bone marrow or umbilical cord blood is of benefit in systemic disease and can prevent (but not usually reverse) CNS deterioration. However, substantial adverse effects limit its use to patients with severe disease. Enzyme replacement therapy with laronidase has been reported to confer benefit on the systemic manifestations of the disease, but since it does not cross the blood-brain barrier in appreciable amounts, beneficial effect on CNS symptoms is again predicted to be unlikely. However, the improvements conferred by enzyme replacement therapy might make haematopoietic stem-cell transplantation easier to tolerate.

Lavender

English Lavender; Kwiat lawendy (lavender flower); Lavande, fleur de (lavender flower); Lavande Vrai; Lavandulae flos (lavender flower); Lavendelblomma (lavender flower); Lavendelblüten; Laventelinkukka (lavender flower); Levandų žiedai (lavender flower); Levandulový květ (lavender flower); Levendulavirág (lavender flower).

Pharmacopoeias. *Eur.* (see p.vii) includes lavender flower.
Ph. Eur. 6.2 (Lavender Flower; Lavandulae flos). It consists of the dried flower of *Lavandula angustifolia* (*L. officinalis*). It contains not less than 1.3% v/w of essential oil, calculated with reference to the anhydrous drug. Protect from light.

Profile

Lavender flower is used as a sedative. It has also been used as a cholagogue. It is an ingredient of herbal remedies used for a variety of disorders.

Lavender flowers are the source of lavender oil (below).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Lavandula Oligoplex; ***Austral.:*** Cimicifuga Compound; ***Austria:*** Euka; Mentopin; ***Braz.:*** Balsamo Branco; Traumac; ***Cz.:*** Melaton†; Schlaf-Nerventee N†; Valofyt Neo; ***Fr.:*** Mediflor Tisane Digestive No 3; ***Ger.:*** Presselin Dyspeptikum†; ***NZ:*** Botanica Hayfever; ***Pol.:*** Lumewal; Nervinolum; Nervosol; Reumobonisol; ***Port.:*** Cholagutt†; Erpecalm; ***S.Afr.:*** Krampdruppels; ***Spain:*** Linimento Naion; ***Switz.:*** Tisane relaxante N†; ***UK:*** Vital Eyes.

Lavender Oil

English Lavender Oil (from *L. intermedia*); Esencia de Alhucema; Esencia de Espliego; Essência de Alfazema; Foreign Lavender Oil (from *L. officinalis*); Huile Essentielle de Lavande; Lavanda, aceite esencial de; Lavande, huile essentielle de; Lavandulae aetheroleum; Lavandulae Etheroleum; Lavanta Yağı; Lavendelöl; Lavendelolja; Lavender Flower Oil; Laventeliöljy; Levandų eterinis aliejus; Levandulová silice; Olejek lawendowy; Oleum Lavandulae.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Lavender Oil). An essential oil obtained by steam distillation from the flowering tops of *Lavandula angustifolia* (*L. officinalis*). A colourless or pale yellow clear liquid with a characteristic odour. Relative density 0.878 to 0.892. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

Profile

Lavender oil has been used as a carminative and as a flavour. It is sometimes applied externally as an insect repellent. Its chief use is in perfumery and it is occasionally used in ointments and other pharmaceutical preparations to cover disagreeable odours. It has been suggested that lavender oil may have sedative properties after inhalation. It is also used in aromatherapy.

Lavender oil has been reported to produce nausea, vomiting, headache, and chills when inhaled or absorbed through the skin. It may cause contact allergy and phototoxicity.

Adverse effects. There have been reports of contact dermatitis associated with lavender oil in a shampoo,[1] and facial dermatitis after application of the oil to pillows for its sedative properties.[2]

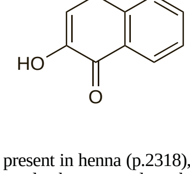
Lawsone

Lawsonia. 2-Hydroxy-1,4-naphthoquinone.
$C_{10}H_6O_3$ = 174.2.
CAS — 83-72-7.



Profile

Lawsone is a dye present in henna (p.2318), the leaves of *Lawsonia* spp., and may also be prepared synthetically. It has been used with dihydroxyacetone in sunscreen preparations. There appears to be no evidence that it has any sunscreening properties when used alone.

Adverse effects. Observation that lawsone causes oxidative damage to red blood cells *in vitro* supported a suggestion that percutaneous absorption of henna could contribute to unexplained neonatal hyperbilirubinaemia in countries where the ceremonial use of henna is widespread.[1]

1. Zinkham WH, Oski FA. Henna: a potential cause of oxidative hemolysis and neonatal hyperbilirubinemia. *Pediatrics* 1996; **97:** 707–9.

Lead

Blei; Plomb; Plomo; Plumbum.
Pb = 207.2.
CAS — 7439-92-1.

Description. Lead is a grey, malleable and ductile metal.

Adverse Effects

Lead poisoning (plumbism) may be due to inorganic or organic lead and may be acute or, more often, chronic. It has followed exposure to a wide range of compounds and objects from which lead may be absorbed following ingestion or inhalation. Some of those that have been incriminated include paint, pottery glazes, crystal glassware, domestic water supplies, petrol, poteen, cosmetics (particularly home-made or traditional forms such as kohl or surma), herbal or folk remedies, including traditional Chinese medicines, newsprint, and retained bullets. Children are often the victims of accidental poisoning and may be vulnerable to chronic exposure to lead from environmental pollution.

Acute effects of lead poisoning include metallic taste, abdominal pain, diarrhoea, vomiting, hypotension, muscle weakness and cramps, fatigue, abnormal liver function tests, and acute interstitial nephritis. Encephalopathy may occur and is more common in children. Symptoms of chronic poisoning with inorganic lead include anorexia, abdominal pain, constipation, anaemia, headache, fatigue, irritability, peripheral neuropathy, and encephalopathy with convulsions and coma. There may be kidney damage and impairment of mental function. Children with elevated lead concentrations may be asymptomatic apart from intellectual deficits and behavioural disorders.

Organic lead poisoning produces mainly CNS symptoms; there can be gastrointestinal and cardiovascular effects, and renal and hepatic damage.

Treatment of Adverse Effects

The main aim in the management of both acute and chronic lead poisoning is to control the symptoms and reduce the concentration of lead in the body. Patients should be removed from the source of exposure and iron and calcium deficiencies corrected.

Treatment of acute symptomatic poisoning entails supportive therapy including intravenous fluids. Renal and hepatic function should also be monitored and convulsions controlled with a benzodiazepine. Encephalopathy, which is rare in adults but more common in children, requires urgent treatment.

Acute ingestion of lead or its salts should be treated if appropriate by activated charcoal or gastric lavage if within 1 hour of ingestion of a potentially life-threatening dose. Emesis is not recommended for organic lead compounds.

In severe cases of inorganic or organic lead poisoning, chelation therapy may be required to facilitate removal of lead from the body. A lead mobilisation test that measures urinary excretion of lead after a standard dose of sodium calcium edetate (p.1462) has been widely used as a means of assessing the need for therapy. However, because of difficulties in administering the test and uncertainties in interpreting results, some authorities have recommended blood-lead concentrations as a guide to treatment. The lead mobilisation test in addition to measurement of blood-lead concentrations may be useful in determining the necessity for chelation therapy in children (see below). Blood-lead concentrations should be obtained before starting chelation therapy, and then again after the first course since mobilisation of stored lead from body tissues may cause blood-lead concentrations to rebound after an initial drop; a second course of chelator may then be required. Raised blood-lead concentrations despite chelation therapy could also indicate continued exposure.

Chelation therapy is not indicated for children with a blood-lead concentration less than 25 micrograms per 100 mL. Children with a blood-lead concentration of 25 to 44 micrograms per 100 mL and a positive sodium calcium edetate mobilisation test should be considered for treatment with oral succimer (p.1466); alternative chelators are oral penicillamine (p.1456), and in the USA but not UK, dimercaprol (p.1444). For blood-lead concentrations of 45 to 70 micrograms per 100 mL, oral succimer should be given, followed by a second course if necessary. If encephalopathy is present or blood-lead concentrations are over 70 micrograms per 100 mL, parenteral sodium calcium edetate should be given with monitoring of renal and hepatic function, followed by a second course of chelator if necessary. In the USA, dimercaprol is given with sodium calcium edetate and 4 hours before the first dose; While dimercaprol has been used in the UK, it is not currently recommended as first-line treatment for lead poisoning.

It is considered that asymptomatic adults do not generally require chelation therapy. Symptomatic adults without encephalopathy may be treated with succimer; alternatives are unithiol, penicillamine or sodium calcium edetate. Adults with severe toxicity or encephalopathy should be treated with parenteral sodium calcium edetate followed by a second course if necessary. As with children (see above), dimercaprol is given with sodium calcium edetate in the USA but not in the UK.

Lead foreign bodies may need to be removed surgically or endoscopically to prevent further exposure. Long-term management of chronic lead poisoning involves eliminating environmental lead exposure. Chelation therapy is not a substitute for environmental controls in those suffering occupational exposure.

◊ Results from one study[1] indicated that succimer did not improve scores on tests of cognition, behaviour, or neuropsychological function despite lowering blood levels of lead in children who had initial levels of less than 45 micrograms per 100 mL. The authors suggested that, since succimer is as effective a chelator as any other currently available, chelation therapy in general may not be beneficial in children with these blood-lead levels.

1. Rogan WJ, *et al.* The effect of chelation therapy with succimer on neuropsychological development in children exposed to lead. *N Engl J Med* 2001; **344:** 1421–6.

Lead in the Environment

Many countries have taken action to reduce lead exposure from environmental sources, including food, paint, and petrol, by limiting or banning altogether the use of lead compounds in such sources. Such measures have been of value in reducing childhood exposure to lead. Screening of all children to detect those at risk of chronic lead poisoning and developmental deficit has been advocated, but selective screening in areas perceived as high risk may be more appropriate in countries where the overall level of lead contamination is low.

Pharmacokinetics

Lead is absorbed from the gastrointestinal tract. It is also absorbed by the lungs from dust particles or fumes.

Inorganic lead is not absorbed through intact skin, but organic lead compounds may be absorbed rapidly.

Lead is distributed in the soft tissues, with higher concentrations in the liver and kidneys. In the blood it is associated with the erythrocytes. Over a period of time lead accumulates in the body and is deposited in calcified bone, hair, and teeth. Lead crosses the placental barrier. It is excreted in the faeces, urine, and sweat, and also appears in breast milk.

Uses and Administration

Lead compounds were formerly used as astringents, but the medicinal use of preparations containing lead is no longer recommended. The lead salts or compounds that have been used have included lead acetate and lead subacetate (for lead lotion, still known sometimes as lotio plumbi), lead carbonate, lead monoxide, and lead oleate (for lead plaster-mass).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Vulpuran; ***Mex.:*** Emplasto Monopolis.

Lecithin

E322; E442 (ammonium phosphatides); Lécithine; Lecithinum; Lecitina; Lesitinler.

Pharmacopoeias. In *Ger.* Also in *USNF.*

USNF 26 (Lecithin). A complex mixture of acetone-insoluble phosphatides, which consists chiefly of phosphatidyl choline, phosphatidyl olamine, phosphatidyl serine, and phosphatidyl inositol, combined with various amounts of other substances such as triglycerides, fatty acids, and carbohydrates, as separated from the crude vegetable oil source. It contains not less than 50% of acetone-insoluble matter.

The consistency of both natural grades and refined grades of lecithin may vary from plastic to fluid, depending upon the content of free fatty acid and oil, and upon the presence or absence of other diluents. Its colour varies from light yellow to brown, depending on the source, on crop variations, and on whether it is bleached or unbleached.

It is odourless or has a characteristic, slight nutlike odour. It is partially soluble in water, but readily hydrates to form emulsions. The oil-free phosphatides are soluble in fatty acids, but are practically insoluble in fixed oils. When all phosphatide fractions are present, lecithin is partially soluble in alcohol and practically insoluble in acetone.

Profile

Lecithin is an emulsifying and stabilising agent used in both the pharmaceutical and the food industries.

Lecithin has also been used as a source of choline in the treatment of dementia (p.362) but with little evidence of clinical benefit. Phosphatidyl serine (p.2367) has been used similarly. Other constituents of lecithin such as phosphatidyl olamine and phosphatidyl inositol may be found in natural pulmonary surfactants (p.2375).

Lecithin is also an ingredient of preparations promoted as tonics and dietary supplements in an enormous range of disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Arg.: Herbaccion Lecitina; Reducin; ***Austral.:*** Buerlecithin; ***Austria:*** Buerlecithin Compact; Dermo WAS; ***Cz.:*** Buerlecithin†; Essentiale N†; ***Ger.:*** Buerlecithin; ***India:*** Essentiale-L; ***Indon.:*** Neurochol; ***Mex.:*** Leciderm; ***Pol.:*** Lecitan; ***Port.:*** Pansebase Solido†; ***Switz.:*** Buerlecithin Compact†; ***Venez.:*** Lecivar.

Multi-ingredient: ***Arg.:*** Ayton; Cholesterol Reducing Plan†; Herbaccion Memory; KLB6 Fruit Diet; No-Gras; Prueboi†; Sojasterol†; Top Life Diet†; ***Austral.:*** Berberis Complex; Bioglan Zellulean with Escin; Extralife Arthri-Care; Extralife Extra-Brite; Extralife Liva-Care; ML 20†; Plantiodine Plus†; ***Austria:*** Bilatin; Buerlecithin; Lecikur; ***Canad.:*** Complex 15†; Kyolic 104†; ***Chile:*** Cartilago T-500; ***Cz.:*** Vita Buerlecithin†; ***Fr.:*** Cholegerol†; ***Ger.:*** Hicoton†; Lipidavit; Tears Again; Vita Buerlecithin†; ***Hong Kong:*** Apaisac; Ginkgo-PS†; Wari-Procomil; ***India:*** Livage; ***Indon.:*** BIO-EPL; Cholesvit; Curson; Epatin; Hepachol; Lanagogum; Lanaven Plus; Lesichol; Nutriflam; Verona; ***Ital.:*** Nutrigel†; Ottovis; Solecin; Tricortin; ***Malaysia:*** Livguard; ***Mex.:*** Lecifar-K†; ***Philipp.:*** Korgivit-E; Liverine; Memori Plus; Memory DD; ***Pol.:*** Lecigal†; Lecytyna E; ***Port.:*** Pansebase; Pansebase Composto; Secpel; Secpel Composto; ***Singapore:*** Ginkgo-PS; ***Switz.:*** Biovital Ginseng; Vita Buerlecithin; ***Thai.:*** Wari-Procomil†; ***UK:*** Kelp Plus 3; S.P.H.P.; ***USA:*** KLB6; ***Venez.:*** Lecivar Plus.

Leishmanin

Leishmanina.

Profile

Leishmanin is a suspension of *Leishmania* promastigotes used in an intradermal test to indicate previous exposure to leishmanial antigens. Its chief use is in epidemiological studies of leishmaniasis (p.824). The leishmanin skin test has also been known as the Montenegro test.

Lemon

Pharmacopoeias. *Br.* includes dried lemon peel and *Swiss* includes fresh lemon peel.

BP 2008 (Dried Lemon Peel). The dried outer part of the pericarp of the ripe, or nearly ripe, fruit of *Citrus limon*. It contains not less than 2.5% v/w of volatile oil.

Profile

Lemon, *Citrus limon* (*Citrus limonum*) (Rutaceae), is an ingredient of herbal remedies used for gastrointestinal disorders and as tonics. The juice is traditionally included in preparations for colds and coughs. Lemon is a source of bioflavonoids used to improve capillary function (see Flavonoid Compounds, p.2304). The peel is the source of lemon oil (p.2332). Citrus fruits are a source of vitamin C (p.1983).

Photosensitivity is associated with citrus oils.

Preparations

BP 2008: Concentrated Compound Gentian Infusion;
USNF 26: Lemon Tincture.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Gencydo; ***Braz.:*** Balsamo Branco; ***Ger.:*** Doppelherz Melissengeist†; Gencydo; ***Ital.:*** Altadrine; ***Port.:*** Erpecalm; ***Rus.:*** Doppelherz Melissa (Доппельгерц Мелисса); ***Switz.:*** Gencydo.

Lemon Oil

Aetheroleum Citri; Citri Etheroleum; Citrinų eterinis aliejus; Citromolaj; Citron, huile essentielle de; Citronenöl; Citronolja; Citronová silice; Esencia de Cidra; Essence de Citron; Essência de Limão; Limón, aceite esencial de; Limonis aetheroleum; Ol. Limon.; Olejek cytrynowy; Oleum Citri; Oleum Limonis; Sitruunaöljy.

Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Lemon Oil). The essential oil obtained by suitable mechanical means without the aid of heat from the fresh peel of *Citrus limon*. It contains a maximum of 0.5% β-caryophyllene, 0.5 to 2.3% geranial, 0.1 to 0.8% geranyl acetate, 56.0 to 78.0% limonene, 0.3 to 1.5% neral, 0.2 to 0.9% neryl acetate, 7.0 to 17.0% β-pinene, 1.0 to 3.0% sabinene, 6.0 to 12.0% γ-terpinene, and a maximum of 0.6% α-terpineol.

A clear mobile pale yellow to greenish-yellow liquid with a characteristic odour. It may become cloudy at low temperatures. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light. Where applicable the label should state that the contents are Italian-type lemon oil.

USNF 26 (Lemon Oil). The volatile oil obtained by expression, without the aid of heat, from the fresh peel of the fruit of *Citrus × limon* (Rutaceae), with or without the previous separation of the pulp and the peel. The total aldehyde content, calculated as citral, is not less than 2.2% and not more than 3.8% for California-type lemon oil, and not less than 3.0% and not more than 5.5% for Italian-type lemon oil. Store in well-filled airtight containers.

Profile

Lemon oil is chiefly used in perfumery and as a flavour. It is used in the preparation of terpeneless lemon oil (below). It has also been used with other volatile agents in rubefacient preparations and preparations for respiratory-tract disorders. Both lemon oil and lemon petitgrain oils (prepared from the leaves and twigs) are used in aromatherapy.

Photosensitivity reactions and contact dermatitis have been reported.

Preparations

BP 2008: Aromatic Ammonia Spirit;
USNF 26: Compound Orange Spirit.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Genuine Australian Eucalyptus Drops†; ***Austria:*** Spasmo Claim; ***Canad.:*** SH-206; ***Chile:*** Agua del Carmen; Agua Melisa Carminativa; ***Cz.:*** Amol; Coldastop; ***Fr.:*** Ephydrol; Poudre du Marcheur; ***Ger.:*** Amol Heilkrautergeist N; Babix-Wundsalbe N†; GeloSitin; Melissengeist; ***Indon.:*** OBH; ***Israel:*** Garonsept; ***Ital.:*** Esoklin; Valda Timo e Limone; Venalta; ***NZ:*** Electric Blue Headlice; Lemsip Dry Cough†; ***Pol.:*** Amol; Argol Essenza Balsamica; Argol Grip; Argol Rheuma; Aromatol; Carmolis; ***Rus.:*** Carmolis (Кармолис)†; ***S.Afr.:*** Balsem Vita GEEL; Balsem Vita ROOI; Spiritus Contra Tussim Drops; ***Switz.:*** Alcoolat de Melisse†; Carmol; Neo-Angin au miel et citron; Perskindol Classic; Pirom; Sansilla; Sibrovita; ***UK:*** Melissa Comp.; ***USA:*** Mexsana.

Terpeneless Lemon Oil

Limón exento de terpeno, aceite esencial de; Oleum Limonis Deterpenatum.

Pharmacopoeias. In *Br.*

BP 2008 (Terpeneless Lemon Oil). A clear colourless or pale yellow liquid, visibly free from water, with the characteristic odour and taste of lemon, prepared by concentrating lemon oil under reduced pressure until most of the terpenes have been removed, or by solvent partition. It contains not less than 40% w/w of aldehydes calculated as citral. Soluble 1 in 1 of alcohol (80%). Store in well-filled containers at a temperature not exceeding 25°. Protect from light.

Profile

Terpeneless lemon oil is used as a flavour. It has the advantages of being stronger in taste and odour and more readily soluble than the natural oil and is used in the preparation of lemon spirit and lemon syrup.

Photosensitivity is associated with citrus oils.

Preparations

BP 2008: Compound Orange Spirit; Lemon Spirit; Lemon Syrup.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** Lemsip Cough & Cold Dry Cough; Meltus Honey & Lemon.

Lemon Grass Oil

Essência de Capim-Limão; Indian Melissa Oil; Indian Verbena Oil; Lemongrass, aceite de; Lemongrass Oil; Oleum Graminis Citrati.

Profile

Lemon grass oil is the volatile oil obtained by distillation from *Cymbopogon flexuosus* or *C. citratus* (Gramineae). It contains citral (p.2284) and citronellal.

Lemon grass oil was formerly given as a carminative. It has been used in perfumery and as a flavour. It is also used in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Apex Repel Natural; ***NZ:*** Apex Repel Natural; ***Switz.:*** Carmol; Carmol Plus†.

Lemon Verbena

Herba Lippiae Citriodorae; Herba Verbenae Odoratae; Hierba luisa; Verbenae citriodoratae folium (lemon verbena leaf); Verveine Odorante; Verveine odorante, feuille de (lemon verbena leaf).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Lemon Verdana Leaf). The whole or fragmented, dried leaves of *Aloysia citriodora* (*A. triphylla*, *Verbena triphylla*, *Lippia citriodora*). It contains a minimum of 2.5% acteoside ($C_{29}H_{36}O_{15}$ = 624.6) expressed as ferulic acid and not less than 0.3% v/w essential oil for the whole drug and 0.2% v/w essential oil for the fragmented drug, all calculated with reference to the dried drug. After grinding it has a characteristic odour reminiscent of lemon.

Profile

Lemon verbena, the flowering tops or leaves of *Lippia citriodora* (*Aloysia triphylla*; *Verbena triphylla*) (Verbenaceae), has antispasmodic and sedative actions and has been used for gastrointestinal disorders and as a tonic. It is most commonly used as an ingredient of herbal teas.

Preparations

Proprietary Preparations (details are given in Part 3)

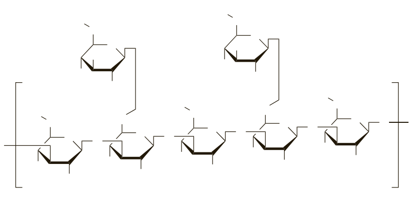
Multi-ingredient: ***Spain:*** Agua del Carmen.

Lentinan

LC-33; Lentinano.

Лентинан

CAS — 37339-90-5.
ATC — L03AX01.
ATC Vet — QL03AX01.



Profile

Lentinan is a β-1,3-D-glucan extracted from the shiitake mushroom *Lentinus edodes* (*Lentinula edodes*). It appears to act as an immunostimulant and has been tried in the treatment of malignant neoplasms and in HIV infection.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***USA:*** Better Cholesterol.

Lepromin

Lepromina.

Profile

Lepromin is a suspension of killed *Mycobacterium leprae* prepared from the skin of heavily infected patients suffering from lepromatous leprosy (lepromin H) or from armadillo tissue infected with *M. leprae* (lepromin A). It is used in an intradermal skin test for the classification of leprosy (p.176) and the assessment of immune responsiveness to *M. leprae.* The test is not diagnostic for leprosy.

◊ The original lepromin (of Mitsuda and Hayashi), a suspension of the whole autoclaved homogenised lepromа including some tissue elements, is sometimes called integral lepromin, whereas purified bacillary suspensions are sometimes called bacillary lepromins.[1] Leprolins are the soluble proteins of the bacilli with or without proteins of the lepra, not coagulated by heating, and do not elicit the early reaction. The Dharmendra antigen is neither a lepromin nor a leprolin and is used especially for testing the early reactions; it gives only a weak late reaction. Purified protein derivatives of *Mycobacterium leprae*, such as leprosin A,[2] have also been developed.

Leptin

Leptina; OB protein.

Лептин

Profile

Leptin, an endogenous peptide hormone produced mainly by white adipocytes in adipose tissue, is involved in the long-term maintenance of body-weight through regulation of food intake and energy expenditure. Leptin has a negative feedback effect on hypothalamic control of neurotransmitters involved in the control of appetite: thus, an increase in adipose tissue mass results in an increase in leptin concentrations that in turn suppresses expression of appetite stimulatory peptides and *vice versa*. Mutations of either the leptin receptor or the *ob* gene that encodes the leptin protein result in failure of leptin's control over appetite producing forms of morbid early-onset obesity. However, it is not clear that common obesity (p.2149) is associated with similar genetic mutations or, as also postulated, is associated with functional leptin resistance caused by sustained high leptin concentrations.

Leptin is produced in other tissues, and studies have suggested additional functions and properties including modulation of neuroendocrine, immune, and reproductive processes. The potential role of leptin in a variety of disease states including syndromes of insulin resistance, auto-immune diseases, and cardiovascular disorders is also being studied.

Replacement therapy with recombinant leptin is under investigation in the management of obesity as well as some other disorders including generalised lipodystrophy and hypothalamic amenorrhoea secondary to energy deficits or low body-weight.

Lerdelimumab *(rINN)*

Lérdelimumab; Lerdelimumabum. Immunoglobulin G4, anti-(human transforming growth factor β2) (human monoclonal CAT-152 γ4-chain), disulfide with human monoclonal CAT-152 λ-chain, dimer.

Лерделимумаб

CAS — 285985-06-0.

Profile

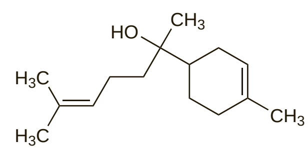
Lerdelimumab is a human monoclonal antibody specific for transforming growth factor β2 that has been investigated for the prevention of excessive postoperative scarring after glaucoma surgery.

Levomenol *(rINN)*

(−)-α-Bisabolol; Lévoménol; Levomenolum; Lewomenol. (−)-6-Methyl-2-(4-methyl-3-cyclohexen-1-yl)-5-hepten-2-ol.

Левоменол

$C_{15}H_{26}O$ = 222.4.
CAS — 23089-26-1.



Profile

Levomenol is a sesquiterpene isolated from the volatile oil of chamomile (p.2279). It has been tried as a transepidermal penetration enhancer and is present in many emollient preparations.

◊ References.

1. Kadir R, Barry BW. α-Bisabolol, a possible safe penetration enhancer for dermal and transdermal therapeutics. *Int J Pharmaceutics* 1991; **70:** 87–94.

Preparations

Proprietary Preparations (details are given in Part 3)

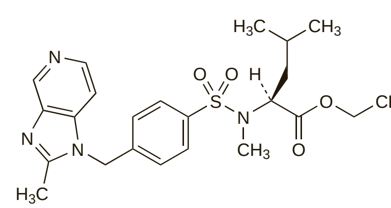
Multi-ingredient: ***Arg.:*** Confortel†; Keracnyl; ***Austria:*** Sensicutan; ***Belg.:*** Purigel Crisp; ***Chile:*** Cuidado Intimo; Eucerin Piel Grasa; Queratopil; Ruboril; Suavigel; ***Cz.:*** Fyterol†; Sensicutan; ***Fr.:*** Alpha 5 DS†; Apaisance†; Clean-AC; Dermophil Indien†; Epiphane†; Keracnyl; Keracnyl eau nettoyante; Seborheane; Squaphane E; Tefirax; ***Ger.:*** Mirfulan Spray N; Sensicutan; ***Hong Kong:*** Kamillosan†; ***Ital.:*** Biothymus DS; Broxo al Fluoro; Decon Lavanda; Intim; Pitiren; Saugella Poligyn 7; Tial-Z; ***Mex.:*** Aveendix; ***Port.:*** Hidratante VV; Lactonico†; ***Switz.:*** Antidry; Dermophil Indien; Tenderdol; ***Thai.:*** Kamillosan†; ***UK:*** Xclair; ***Venez.:*** Kamillosan.

Lexipafant *(BAN, USAN, rINN)*

BB-882; DO-6; Lexipafantum. Ethyl *N*-methyl-*N*-[α-(2-methylimidazo[4,5-*c*]pyridin-1-yl)tosyl]-L-leucinate.

Лексипафант

$C_{23}H_{30}N_4O_4S$ = 458.6.
CAS — 139133-26-9.



Profile

Lexipafant is a platelet-activating factor antagonist that is being investigated in the prevention of neurological and renal complications after cardiac surgery. It has also been studied for possible applications in asthma, sepsis, and pancreatitis.

Linseed

Flaxseed; Leinsamen; Lenmag; Lin; Lin, graine de; Linaza; Linfrö; Linho; Lini semen; Lini Semina; Linum; Lněné semeno; Nasienie lnu; Pellavansiemen; Sėmenys; Semilla de Lino.

ATC — A06AC05.
ATC Vet — QA06AC05.

Pharmacopoeias. In *Chin.* and *Eur.* (see p.vii).

Ph. Eur. 6.2 (Linseed). The dried ripe seeds of *Linum usitatissimum.* Protect from light.

Profile

Preparations of linseed have been administered for their demulcent and laxative actions. Crushed linseed has been used as a poultice. Linseed is the source of linseed oil, below. Linseed has also been tried as a dietary supplement to improve postmenopausal symptoms.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Chile:*** Aloelax; Instalax; ***Ger.:*** Duoventrin; Pascomag†; ***Pol.:*** Laxantol; ***Singapore:*** Tofupill†; ***Switz.:*** Linoforce; LinoMed; ***UK:*** Salinum.

Linseed Oil

Aceite de Linaza; Flaxseed Oil; Huile de Lin; Leinöl; Lenolaj; Lin, huile de; Linaza, aceite de; Lini oleum; Linolja; Lněný olej; Oleum Lini; Pellavaöljy; Sėmenų aliejus.

ATC — A06AC05.
ATC Vet — QA06AC05.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Linseed Oil, Virgin). The oil obtained by cold expression from ripe seeds of *Linum usitatissimum*. A suitable antoxidant may be added. A clear, yellow or brownish-yellow liquid. It turns dark and gradually thickens on exposure to air. When cooled, it becomes a soft mass at about –20°. Relative density about 0.931. Very slightly soluble in alcohol; miscible with petroleum spirit. Store in airtight containers. Protect from light.

Profile

Linseed oil is used in veterinary medicine as a purgative for horses and cattle. In man, linseed oil is included in topical preparations for a variety of skin disorders. It has been tried as a vegetable source of omega-3 fatty acids (p.1362).

Boiled linseed oil ('boiled oil') is linseed oil heated with litharge, manganese resinate, or other driers, to a temperature of about 150° so that metallic salts of the fatty acids are formed and cause the oil to dry more rapidly. It must not be used for medicinal purposes.

Preparations

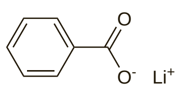
Proprietary Preparations (details are given in Part 3)
Chile: Linna-Oil; ***Mex.:*** Omelina.

Multi-ingredient: ***Austria:*** Dermowund; ***Canad.:*** Prostate Ease; ***India:*** Buta-Proxyvon; Duoflam Gel; Nicip Super; Nimulid Nugel; ***Rus.:*** Dicloran Plus (Диклоран Плюс); ***Switz.:*** Epithelial†; Malvedrin; ***UK:*** Nine Rubbing Oils.

Lithium Benzoate ⊗

Litio, benzoato de.

$C_7H_5LiO_2$ = 128.1.
CAS — 553-54-8.



Profile

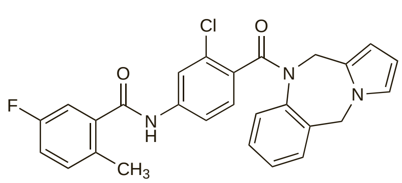
Lithium benzoate has been used as a diuretic and urinary disinfectant. Its use cannot be recommended because of the pharmacological effect of the lithium ion (p.401). Each g contains 7.8 mmol of lithium.

Lixivaptan *(USAN, rINN)* ⊗

Lixivaptán; Lixivaptanum; VPA-985; WAY-VPA-985. 3′-Chloro-5-fluoro-4′-(5*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-10(11*H*)-ylcarbonyl)-*o*-toluanilide.

Ликсиваптан

$C_{27}H_{21}ClFN_3O_2$ = 473.9.
CAS — 168079-32-1.



Profile

Lixivaptan is a selective vasopressin V_2-receptor antagonist under investigation for the treatment of hyponatraemia in patients with heart failure.

◊ References.

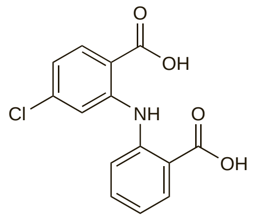
1. Abraham WT, *et al.* Aquaretic effect of lixivaptan, an oral, non-peptide, selective V2 receptor vasopressin antagonist, in New York Heart Association functional class II and III chronic heart failure patients. *J Am Coll Cardiol* 2006; **47:** 1615–21.

Lobenzarit Sodium *(USAN, rINNM)*

CCA; Lobenzarit sódico; Lobenzarit Sodique; Natrii Lobenzaritum. 4-Chloro-2,2′-iminodibenzoate disodium.

Натрий Лобензарит

$C_{14}H_8ClNNa_2O_4$ = 335.7.
CAS — 63329-53-3 (lobenzarit); 64808-48-6 (lobenzarit sodium).



(lobenzarit)

Profile

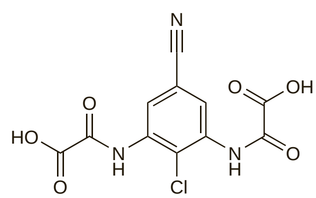
Lobenzarit sodium has been used as an immunomodulator in rheumatoid arthritis.

Lodoxamide *(BAN, rINN)*

Lodoksamidi; Lodoxamid; Lodoxamida; Lodoxamidum; U-42585. *N,N′*-(2-Chloro-5-cyano-*m*-phenylene)dioxamic acid.

Лодоксамид

$C_{11}H_6ClN_3O_6$ = 311.6.
CAS — 53882-12-5.
ATC — S01GX05.
ATC Vet — QS01GX05.



Lodoxamide Ethyl *(BANM, USAN, rINNM)*

Ethylum Lodoxamidum; Lodoxamida etilo; Lodoxamide Ethyle; U-42718. Diethyl *N,N′*-(2-Chloro-5-cyano-*m*-phenylene)dioxamate.

Этил Лодоксамид

$C_{15}H_{14}ClN_3O_6$ = 367.7.
CAS — 53882-13-6.

Lodoxamide Trometamol *(BANM, rINNM)*

Lodoksamid Trometamin; Lodoxamida trometamol; Lodoxamide Trométamol; Lodoxamide Tromethamine *(USAN)*; Lodoxamidum Trometamolum; U-42585E. *N,N′*-(2-Chloro-5-cyano-*m*-phenylene)dioxamic acid compound with trometamol.

Лодоксамид Трометамол

$C_{11}H_6ClN_3O_6,2C_4H_{11}NO_3$ = 553.9.
CAS — 63610-09-3.
ATC — S01GX05.
ATC Vet — QS01GX05.

Adverse Effects

Lodoxamide eye drops may cause local irritation. Reported effects include burning or stinging, and itching. Flushing and dizziness have also been reported.

Uses and Administration

Lodoxamide has a stabilising action on mast cells resembling that of sodium cromoglicate (p.1136). Lodoxamide trometamol is used in eye drops for allergic conjunctivitis (p.564), particularly vernal keratoconjunctivitis; a concentration equivalent to 0.1% of lodoxamide is used, 1 or 2 drops usually being instilled into the eye four times daily.

Lodoxamide has also been studied for its prophylactic effect in the treatment of asthma, but has not proved to be of benefit; it has usually been given orally as the ethyl ester or by inhalation as the trometamol salt.

Conjunctivitis. Lodoxamide is an effective treatment for vernal keratoconjunctivitis.[1,2] There is some evidence that it may be more effective than sodium cromoglicate for this purpose (see p.1138).

Lomifylline *(rINN)*

Lomifilina; Lomifyllinum. 7-(5-Oxohexyl)theophylline.

Ломифиллин

$C_{13}H_{18}N_4O_3$ = 278.3.
CAS — 10226-54-7.

Profile

Lomifylline is a theophylline derivative that has been used in preparations for cerebrovascular disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Arg.:*** Cervilane; Micerfin; ***Braz.:*** Norogil; ***Chile:*** Cervilane; ***Mex.:*** Cervilan; ***Port.:*** Cervilane†.

Loosestrife

Fackelblomster; Kyprejová nať; Lythri herba; Purple Loosestrife; Rantakukka; Raudoklių žolė; Réti fűzényfű; Salicaire.

NOTE. Do not confuse with yellow willowherb, *Lysimachia vulgaris* which is also known as loosestrife.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Loosestrife; Lythri Herba). The dried flowering tops, whole or cut, of *Lythrum salicaria*. It contains not less than 5.0 % of tannins, expressed as pyrogallol and calculated with reference to the dried drug. Protect from light.

Profile

Purple loosestrife, *Lythrum salicaria* (Lythraceae), is used in herbal medicine for the treatment of diarrhoea. It is also used for its astringent and antimicrobial properties.

Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Salicairine.

Lorenzo's Oil

Lorenzo, aceite de.

Glyceryl Trierucate

Trierucin. 1,2,3-Propanetriol tri(13-docosenoate).

$C_{69}H_{128}O_6$ = 1053.8.
CAS — 2752-99-0.

Glyceryl Trioleate

Triolein. 1,2,3-Propanetriol tri(9-octandecenoate).

$C_{57}H_{104}O_6$ = 885.4.
CAS — 122-32-7.

Profile

Lorenzo's oil is a liquid containing glyceryl trierucate (a source of erucic acid) and glyceryl trioleate (a source of oleic acid), in the ratio 1 part to 4 parts respectively. It has been used with dietary modification for the treatment of adrenoleucodystrophy, a genetic disorder characterised by demyelination, adrenal cortical insufficiency, and accumulation of saturated 'very-long-chain fatty acids'.

Adrenoleucodystrophy. Adrenoleucodystrophy is a rare X-linked metabolic disorder in which accumulation of saturated very-long-chain fatty acids results in diffuse and multifocal demyelination of the nervous system and adrenocortical insufficiency. The most common form usually affects children and is characterised primarily by cerebral demyelination; it is usually fatal within a few years. In the adult variant, called adrenomyeloneuropathy, demyelination of the spinal cord and peripheral neuropathy progress slowly over many years.[1,2]

There appears to be no effective treatment for adrenoleucodystrophy or its variants. A high dietary intake of long-chain monounsaturated fatty acids, as provided by the mixture Lorenzo's oil (glyceryl trierucate with glyceryl trioleate), has been tried, the idea being to monopolise the specific enzyme involved in the conversion of long-chain fatty acids to very-long-chain fatty acids. Although dietary therapy with Lorenzo's oil has reduced plasma concentrations of saturated very-long-chain fatty acids, there is no evidence that this improves or delays progression of adrenoleucodystrophy or adrenomyeloneuropathy.[3-6] However, it has been suggested that these disorders may not respond to correction of the biochemical abnormality once neurological damage has occurred.[5] The effectiveness of treatment before the appearance of neurological symptoms is currently being studied with some encouraging results.[7] There is some evidence to suggest that the childhood form may have an immunological component, but results using immunosuppressants or immunoglobulins have been reported to be disappointing.[5] Bone marrow transplants may improve symptoms but should only be tried in those with mild cerebral involvement.[1] Lovastatin can also reduce plasma concentrations of very-long-chain fatty acids.[8]

Adverse effects. Thrombocytopenia has been reported in patients receiving Lorenzo's oil, although patients are often asymptomatic.[1] It is possible that giant platelets which retain most of their function are produced and that these are not counted by automatic counting procedures giving a false impression of thrombocytopenia.[2]

Lymphocytopenia with an increased incidence of infection has also been reported in few patients.[3]

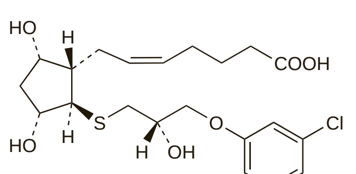
Luprostiol *(BAN, rINN)*

Luprostioli; Luprostiolum. (±)-(*Z*)-7-{(1*S*,2*R*,3*R*,5*S*)-2-[(2*S*)-3-(3-Chlorophenoxy)-2-hydroxypropylthio]-3,5-dihydroxycyclopentyl}hept-5-enoic acid.

Лупростиол

$C_{21}H_{29}ClO_6S$ = 445.0.
CAS — 67110-79-6.
ATC Vet — QG02AD91.



and enantiomer

Profile

Luprostiol is a synthetic analogue of dinoprost (prostaglandin F_2). It is used as a luteolytic in veterinary medicine.

Lupulus

Apynių spurgai; Chmelová šištice; Hop Strobile; Hopfenzapfen; Hops; Houblon; Houblon, cône de; Humalankukka; Humlekotte; Humulus; Komlótoboz; Lupuli flos; Lupuli Strobulus; Lúpulo; Strobili Lupuli; Szyszka chmielu.

Pharmacopoeias. In *Eur.* (see p.vii).
Ph. Eur. 6.2 (Hop Strobile). The dried, generally whole, female inflorescences (strobiles) of the hop plant *Humulus lupulus*. It has a characteristic aromatic odour. Protect from light.

Profile

Lupulus has been used as a bitter, and supplies the characteristic flavour of beers. It is used in herbal and folk medicine as a sedative.

Homoeopathy. Lupulus has been used in homoeopathic medicines under the following names: Humulus lupulus; Lupulinum; Humulus lupulus e glandulis; Lupul.

Lycopene

E160(d).
CAS — 502-65-8.

Pharmacopoeias. In *US* which also includes Tomato Extract Containing Lycopene.
USP 31 (Lycopene). A mixture of geometrical isomers of lycopene. Store in airtight containers under an inert gas at a temperature of 8° to 15°. Protect from light.

Profile

Lycopene is a carotenoid responsible for the red colour of tomatoes and some other fruits including rose fruit (p.2381). It is used as a colouring agent and antioxidant. Much interest has been expressed in the antioxidant properties of lycopene for the potential prevention of diseases such as cardiovascular disease and some cancers, particularly of the prostate gland. Lycopene is also an ingredient of some skin preparations.

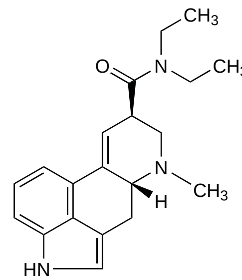
Lysergide *(BAN, rINN)*

Lisergida; Lisérgido; LSD; LSD-25; Lysergic Acid Diethylamide; Lysergidum. (+)-*NN*-Diethyl-D-lysergamide; (6a*R*,9*R*)-*NN*-Diethyl-4,6,6a,7,8,9-hexahydro-7-methylindolo[4,3-*fg*]quinoline-9-carboxamide.

Лизергид

$C_{20}H_{25}N_3O$ = 323.4.
CAS — 50-37-3.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of lysergide:
25; 25s; 100s; A; Acid; Acid tabs; Acido; Aeon flux; Alice; Alphabet; Angel tears; Angry paper; Animal; Barrels; Bart Simpson; Battery acid; Beast; Beavis & Butthead; Bells; Bevis & Butthead; Big D; Big daddy; Bird head; Birdhead; Black acid; Black star; Black sunshine; Black tabs; Blackbird; Blaze; Blotter; Blotter acid; Blotter cube; Blotters; Blue acid; Blue barrels; Blue chairs; Blue cheers; Blue fly; Blue heaven; Blue heavens; Blue microdot; Blue mist; Blue moons; Blue star; Blue tabs; Blue vials; Boomers; Brown bombers; Brown dots; Buvard; California sunshine; Cap; Caps; Casper the ghost; Caviar; Cheap basing; Cheers; Chief; Chinese dragons; Cid-drip the entertainer; Chocolate chips; Church; Cid; Class; Coffee; Colors; Comic book; Conductor; Contact lens; Crackers; Crystal; Crystal tea; Cube; Cupcakes; D; Deeda; Dental floss; Diablo; Dinosaurs; Domes; Dose; Doses; Dosure; Dots; Double dome; Dragon; DSL; El Cid; Electric Kool Aid; Ellis Day; Elvis; Eye Candy; Felix; Felix the Cat; Fields; Flash; Flashers; Flat blues; Flats; Flying triangle; Frogs; Fry; Gel; Gel caps; Gelatine squares; Geltab; Ghost; God's flesh; Golden dragon; Golf balls; Goofy's; Gooney birds; Grape parfait; Green double domes; Green single dome; Green single domes; Green wedge; Grey shields; Groovy lemon; Hats; Hawaiian sunshine; Hawk; Haze; Head light; Head lights; Headlights; Heaven; Heavenly; Heavenly blue; Illusions; Infinity; Instant zen; Jesus Christ acid; Kaliedescope; Keys to the kingdom; L; LAD; Lake Shore Drive; Laogor; Lason daga; Lason sa daga; Lavender; LBJ; Leary's; Lenos; Lens; Lids; Lime acid; Little smoke; Live, Spit and Die; Logor; Loony Toons; LSD; LSD-25; Lucy; Lucy in the sky with diamonds; Magic Tickets; Mellow yellow; Mickey's; Microdot; Microdots; Midnight Quinn; Mighty Quinn; Mikes; Mind blow; Mind detergent; Mist; Mister Natural; Monstre rouge; Monstre vert; Monterey Purple; Moons; Mother of God; Newspapers; One way; Oneway; Optical illusions; Orange ba; Orange barrels; Orange cubes; Orange haze; Orange micro; Orange sunshine; Orange wedges; Owsley; Owsley's acid; Owsley's blue dot; Ozzie's stuff; Pane; Paper; Paper acid; Peace; Peace tablets; Peaks; Pearly gates; Pellets; Pepa; Phoenix; Pills; Pink blotters; Pink panther; Pink robots; Pink wedge; Pink wedges; Pink witche; Pink witches; Pizza; Potato; Pure love; Purple barrels; Purple dome; Purple dots; Purple flats; Purple gel tabs; Purple haze; Purple hearts; Purple mikes; Purple ozoline; Purple wedge; Pyramid; Pyramids; Rain Drops; Rainbow; Recycle; Red lips; Rips; Royal blues; Roz-rox; Russian sickles; Sacrament; Sandoz; Serenity; Sheets; Shields; Sherman; Sid; Smears; Smiley; Snowmen; South parks; Specks; Square dancing tickets; Squirrel; Stamp; Stanley's stuff; Star; Strawberries; Strawberry; Strawberry fields; Sugar; Sugar cubes; Sugar lumps; Sunrise; Sunshine; Sunshine Acid; Superman; Syd; T; Tab; Tabs; Tail lights; Teddy bears; The Ghost; The Hawk; Ticket; Tickets; Ticket to ride; Timothy Leary; Timothy Leary Ticket; Trip; Trippers; Trips; Twenty-five; Uncle Sid; Uncle Sidney; Valley dolls; Vodka acid; Volcano 5; Vulcoes; Wafer; Waffles; Watercolors; Wedding bells; Wedge; Wedges; White dust; White lightning; White Owsley's; Window glass; Window pane; Woodstock; Yellow; Yellow dimples; Yellow sunshine; Yellows; Ying Yang; Zen; Zig Zag man.

Profile

Lysergide was formerly used therapeutically but is now encountered as a drug of abuse for its hallucinogenic and psychedelic properties.

There is considerable variation in individual reaction to lysergide. Disorders of visual perception are among the first and most constant reactions to lysergide. Subjects may be hypersensitive to sound. Extreme alterations of mood, depression, distortion of body image, depersonalisation, disorders of thought and time sense, and synaesthesia may be experienced. Anxiety, often amounting to panic, may occur (a 'bad trip'). Duration of effects may last for up to 12 hours after ingestion, although hallucinations can sometimes last up to 48 hours and psychoses for up to 4 days. The effects of lysergide may recur months after ingestion of lysergide; the recurrence or 'flashback' may be spontaneous or induced by alcohol, other drugs, stress, or fatigue.

The subjective effects of lysergide may be preceded or accompanied by somatic effects that are mainly sympathomimetic in nature and include mydriasis, tremor, hyperreflexia, hyperthermia, piloerection, muscle weakness, and ataxia. There may be nausea and vomiting and increased heart rate and blood pressure. Derangement of blood clotting mechanisms has been described. In addition, respiratory arrest, convulsions, and coma may result from overdoses. There is no evidence of fatal reactions to lysergide in man, although accidental deaths, suicides, and homicides have occurred during lysergide intoxication.

Tolerance develops to the behavioural effects of lysergide after several days and may be lost over a similar period. There is cross-tolerance between lysergide, mescaline, and psilocybine and psilocin, but not to amfetamine or to cannabis.

Physical dependence on lysergide does not seem to occur.

Mace Oil

Macis, aceite de.

NOTE. Mace has also been used as a name for solutions of chloroacetophenone (p.2280), a tear gas.

Profile

Mace oil is a volatile oil obtained by distillation from mace, the arillus of the seed of *Myristica fragrans* (Myristicaceae).

Nutmeg (p.2355) is the dried kernel of the seed of *M. fragrans.*

Mace is used as a flavour and carminative similarly to nutmeg. It has also been used with herbal substances and other volatile agents in preparations for musculoskeletal and respiratory-tract disorders. As with nutmeg, large doses of mace may cause epileptiform convulsions and hallucinations.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** China-Eisenwein; ***Cz.:*** Dr Theiss Schwedenbitter; Original Schwedenbitter; ***Rus.:*** Himcolin (Химколин).

Macrogols

Macrogola; Macrogoles; Macrogoller; Makrogoler; Makrogoliai; Makrogolit; Makrogolok; Makrogoly; PEGs; Polietilen Glikoller; Polyethylene Glycols; Polyoxyethylene Glycols.

$CH_2(OH)(CH_2OCH_2)_mCH_2OH$. Alternatively some authorities use the general formula $H(OCH_2CH_2)_nOH$ when the number assigned to n for a specified macrogol is 1 more than that of m in the first formula.

CAS — 25322-68-3 (macrogols); 37361-15-2 (macrogol 300).

ATC — A06AD15.

ATC Vet — QA06AD15.

Nomenclature. Macrogol is *BAN* and *rINN*. The name is followed by a figure which corresponds approximately to its average molecular weight.

Pharmacopoeias. Macrogols of various molecular weights are included in many pharmacopoeias.

Eur. (see p.vii) has a general monograph describing macrogol 300, 400, 600, 1000, 1500, 3000, 3350, 4000, 6000, 8000, 20 000, and 35 000. *USNF* has a general monograph describing Polyethylene Glycol which requires that it be labelled with the average nominal molecular weight as part of the official title.

Ph. Eur. 6.2 (Macrogols). Mixtures of polymers with the general formula $H(OCH_2CH_2)_nOH$, where n represents the average number of oxyethylene groups. The type of macrogol is defined by a number that indicates the average relative molecular mass. A suitable stabiliser may be added.

Macrogol 300, 400, and 600 are clear, viscous, colourless or almost colourless, hygroscopic liquids. Miscible with water; very soluble in alcohol, in acetone, and in dichloromethane.

Macrogol 1000 is a white or almost white, hygroscopic solid with a waxy or paraffin-like appearance. Very soluble in water; freely soluble in alcohol and in dichloromethane.

Macrogol 1500 is a white or almost white solid with a waxy or paraffin-like appearance. Very soluble in water and in dichloromethane; freely soluble in alcohol.

Macrogol 3000 and 3350 are white or almost white solids with a waxy or paraffin-like appearance. Very soluble in water and in dichloromethane; very slightly soluble in alcohol.

Macrogol 4000, 6000, and 8000 are white or almost white solids with a waxy or paraffin-like appearance. Very soluble in water and in dichloromethane; practically insoluble in alcohol.

Macrogol 20 000 and 35 000 are white or almost white solids with a waxy or paraffin-like appearance. Very soluble in water; practically insoluble in alcohol; soluble in dichloromethane.

All macrogols are practically insoluble in fatty oils and in mineral oils. All macrogols should be stored in airtight containers.

USNF 26 (Polyethylene Glycol). Addition polymers of ethylene oxide and water, represented by the formula $H(OCH_2CH_2)_nOH$, in which n represents the average number of oxyethylene groups. They may contain a suitable antioxidant. Each macrogol is usually designated by a number that corresponds approximately to its average molecular weight. As the average molecular weight increases, the water solubility, hygroscopicity, and solubility in organic solvents decrease, while the viscosity increases.

Liquid grades occur as clear to slightly hazy, colourless or practically colourless, slightly hygroscopic, viscous liquids, having a slight, characteristic odour. Solid grades occur as practically odourless, white, waxy, plastic material having a consistency similar to beeswax, or as creamy-white flakes, beads, or powders. Liquid grades are miscible with water; solid grades are freely soluble in water; all grades are soluble in alcohol, in acetone, in chloroform, in ethoxyethanol, in ethyl acetate, and in toluene; all grades are insoluble in ether and in hexane. The pH of a 5% solution of a macrogol in water is between 4.5 and 7.5.

Store in airtight containers.

Incompatibility. Macrogols can demonstrate oxidising activity leading to incompatibilities. The activity of bacitracin or benzylpenicillin may be reduced in a macrogol base. Some plastics are softened by macrogols.

Adverse Effects and Precautions

Macrogols appear to have relatively low toxicity, although any toxicity appears to be greatest with the macrogols of low molecular weight. They may cause stinging when used topically, especially on mucous membranes, and have been associated with hypersensitivity reactions such as urticaria. Hyperosmolality, metabolic acidosis, and renal failure have been reported after topical application of macrogols to burn patients. Topical preparations with a macrogol base should therefore be used with caution in patients with renal impairment and/or large areas of raw surfaces, burns, or open wounds.

Patients undergoing bowel cleansing with mixtures of macrogols (3350 or 4000) and electrolytes commonly experience local gastrointestinal discomfort, bloating, and nausea. Abdominal cramps, vomiting, and anal irritation may also occur and there have been rare reports of possible hypersensitivity reactions. These colonic lavage solutions are contra-indicated in gastrointestinal obstruction or perforation, ileus, gastric retention, peptic ulcer disease, and toxic megacolon; caution is advisable in patients with ulcerative colitis. Since aspiration may be a problem, they should be used with caution in patients with an impaired gag reflex, reflux oesophagitis, or diminished levels of consciousness. They should be given with caution to diabetic patients. Drugs taken within one hour of starting colonic lavage with an oral macrogol and electrolyte mixture may be flushed from the gastrointestinal tract unabsorbed.

Effects on fluid and electrolyte homoeostasis. A syndrome of elevated total serum calcium (with a concomitant decrease in ionised calcium), hyperosmolality, metabolic acidosis, and renal failure has been observed in *animals*[1] and in burn patients[2] after the topical application of preparations with a macrogol base. The FDA has recommended that topical preparations containing macrogols should be used with caution in burn patients with known or suspected renal impairment, as macrogols absorbed through denuded skin and not excreted normally by a compromised kidney could lead to symptoms of progressive renal impairment.[3]

The use of macrogol and electrolyte solutions for bowel preparation has also been associated with sodium and water retention, resulting in exacerbation of heart failure in a patient with diabetic gastroparesis,[4] and with the development of pulmonary oedema possibly due to aspiration in a child without cardiac or renal disease.[5]

1. Herold DA, *et al.* Toxicity of topical polyethylene glycol. *Toxicol Appl Pharmacol* 1982; **65:** 329–35.
2. Bruns DE, *et al.* Polyethylene glycol intoxication in burn patients. *Burns* 1982; **9:** 49–52.
3. Anonymous. Topical PEG in burn ointments. *FDA Drug Bull* 1982; **12:** 25–6.
4. Granberry MC, *et al.* Exacerbation of congestive heart failure after administration of polyethylene glycol-electrolyte lavage solution. *Ann Pharmacother* 1995; **29:** 1232–5.
5. Paap CM, Ehrlich R. Acute pulmonary edema after polyethylene glycol intestinal lavage in a child. *Ann Pharmacother* 1993; **27:** 1044–7.

Effects on the kidneys. Macrogol 400, which was present in a lorazepam injection, could have contributed to renal damage suggestive of acute tubular necrosis in a patient who received large doses (averaging lorazepam 95 mg daily) for 43 days.[1] The cumulative dose of macrogol 400 during this period was about 220 mL.

1. Laine GA, *et al.* Polyethylene glycol nephrotoxicity secondary to prolonged high-dose intravenous lorazepam. *Ann Pharmacother* 1995; **29:** 1110–14.

Hypersensitivity. Hypersensitivity to macrogols is uncommon but both immediate urticarial reactions and delayed allergic contact dermatitis have been reported following the topical application of preparations with a macrogol vehicle or base.[1] An anaphylactic reaction has been associated with the ingestion of macrogols in a multivitamin tablet.[2] The manufacturers of preparations containing macrogols and electrolytes for bowel cleansing have reported isolated instances of skin reactions and rhinorrhoea.

1. Fisher AA. Immediate and delayed allergic contact reactions to polyethylene glycol. *Contact Dermatitis* 1978; **4:** 135–8.
2. Kwee YN, Dolovich J. Anaphylaxis to polyethylene glycol (PEG) in a multivitamin tablet. *J Allergy Clin Immunol* 1982; **69:** 138.

Overdosage. Ingestion of 2 litres of a colonic lavage solution containing macrogol 400 instead of macrogol 4000 resulted in a patient developing severe metabolic acidosis due to systemic absorption of the macrogol and rapidly becoming comatose.[1] The patient was successfully treated with intravenous bicarbonate and dialysis.

1. Bélaïche J, *et al.* Coma acidosique après préparation colique par du polyèthylène glycol. *Gastroenterol Clin Biol* 1983; **7:** 426–7.

Pharmacokinetics

Liquid macrogols may be absorbed when taken by mouth but macrogols of high molecular weight, such as macrogol 3350, are not significantly absorbed from the gastrointestinal tract. There is evidence of absorption of macrogols when applied to damaged skin. Macrogols entering the systemic circulation are predominantly excreted unchanged in the urine; low-molecular-weight macrogols may be partly metabolised.

◊ References.

1. DiPiro JT, *et al.* Absorption of polyethylene glycol after administration of a PEG-electrolyte lavage solution. *Clin Pharm* 1986; **5:** 153–5.

Uses and Administration

Macrogols are relatively stable, non-toxic compounds which have a range of properties depending on their molecular weight. They are widely used in pharmaceutical manufacturing as water-soluble bases for topical preparations and suppositories, as solvents and vehicles, and as solubilising agents, tablet binders, plasticisers in film coating, and tablet lubricants. They have also been reported to have antibacterial properties. Macrogols of high molecular weight such as macrogol 4000 have been used as inert markers in studies on intestinal absorption and excretion.

A mixture of macrogol 3350 or 4000 with electrolytes is used for **bowel preparation** before colonoscopy, radiological procedures, or surgery. These preparations have been formulated so that the osmotic activity of the macrogol and concentrations of the electrolytes result in a minimum net effect on the fluid and electrolyte balance. Reconstituted aqueous solutions of different preparations contain about 59 g or 100 g or 105 g of the macrogol per litre. The method of administration depends on the preparation. Adults are given 200 to 300 mL of the reconstituted aqueous solution, which they have to swallow rapidly, and this is repeated every 10 to 15 minutes until the rectal effluent is clear, or until a total of 3 to 4 litres of the solution has been consumed. Alternatively, 2 litres of reconstituted solution is taken in the evening preceding the clinical procedure, or divided as 1 litre in the evening and 1 litre in the early morning of the day of the procedure. A dose for children is 25 mL/kg per hour. Bowel evacuation usually begins about 1 hour after starting dosage and is complete in about 4 hours. Patients should fast for at least 2 or 3 hours before drinking the solution. Additional flavouring ingredients, sugar, or other sweeteners should not be added to the solution. If distension or pain occur, dosage should be temporarily stopped or the interval between drinks extended. For use by nasogastric tube, a rate of 20 to 30 mL per minute has been used.

Similar preparations are used in patients 12 years of age and over for the treatment of **chronic constipation** in a usual dose of 125 mL of a solution containing 105 g of the macrogol per litre, up to three times daily. The maximum course is 2 weeks, which may be repeated if necessary. For children with chronic constipation, the usual initial daily dose for those aged 2 to 6 years is 62.5 mL, and for those aged 7 to 11 years, 125 mL. Thereafter, the dose should be increased or decreased as necessary to produce regular soft stools; the usual maximum dose is 250 mL daily.

In the management of **faecal impaction**, 8 doses of 125 mL of solution should be consumed within 6 hours for a maximum of 3 days. Patients with impaired cardiovascular function should take no more than 2 doses in any one hour. Children aged 5 to 11 years may be treated for faecal impaction in an escalating dose until disimpaction occurs up to a maximum of 7 days; the total daily dose should be divided and consumed within a 12-hour period. Four doses of 62.5 mL of solution are given initially on the first day, increasing steadily to a maximum of 12 doses daily on days 5 to 7. Doses for prevention of recurrence of faecal impaction in children are as for children's doses for chronic constipation (see above). The *BNFC* recommends that children aged 1 to 5 years with faecal impaction may be given two doses of 62.5 mL of solution on the first day, then four doses daily for 2 days, then 6 doses daily for 2 days, and finally 8 doses daily on days 6 and 7.

Conjugation of drugs and therapeutic proteins with macrogols (**pegylation**) has been tried in an attempt to improve their pharmacokinetic profiles and to reduce their adverse effects. Pegylation may also reduce the immunogenicity of therapeutic proteins. Examples of pegylated proteins include pegademase (p.2364), pegaspargase (p.682), and peginterferon alfa (p.888).

Drug delivery systems. References to the use of macrogols in delivery systems for drugs and proteins.

Magnesium Glutamate Hydrobromide

Glutamato magnésico, hidrobromuro de; Magnesium α-Aminoglutarate Hydrobromide; Magnesium Bromoglutamate.

$(C_5H_8NO_4)_2Mg,HBr = 397.5.$

Profile

Magnesium glutamate hydrobromide has been used as a sedative and hypnotic in the treatment of insomnia, neuroses, and behavioural disorders. The use of bromides is generally deprecated (see p.2269).

Preparations

Proprietary Preparations (details are given in Part 3)

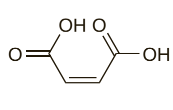
Multi-ingredient: ***Chile:*** Gamalate B6; ***Spain:*** Cefabol; Gamalate B6; Psicosoma Solucion.

Maleic Acid

Acide maléique; Acidum maleicum; (*Z*)-Butenedioic Acid; Kwas maleinowy; Kyselina maleinová; Maleico, ácido; Maleiinihappo; Maleino rūgštis; Maleinsav; Maleinsyra; Toxilic Acid. *cis*-Butenedioic acid.

$C_2H_2(CO_2H)_2 = 116.1.$

CAS — 110-16-7.



Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Maleic Acid). A white or almost white, crystalline powder. Freely soluble in water and in alcohol. A 5% solution in water has a pH of less than 2. Store in glass containers. Protect from light.

USNF 26 (Maleic Acid). A white crystalline powder. Freely soluble in water and in alcohol; sparingly soluble in ether. Store in airtight glass containers. Protect from light.

Profile

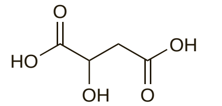
Maleic acid is used in the preparation of Ergometrine Injection (BP 2008) and Ergometrine and Oxytocin Injection (BP 2008).

Malic Acid

Acide Malique; Acidum malicum; Acidum Malicum Racemicum; Äppelsyra; Apple Acid; E296; Hydroxysuccinic Acid; Kyselina jablečná racemická; Málico, ácido; Obuolių rūgštis; Omenahappo. (2*RS*)-2-Hydroxybutanedioic acid.

$C_4H_6O_5 = 134.1.$

CAS — 6915-15-7 (malic acid); 636-61-3 ((+)-malic acid); 97-67-6 ((−)-malic acid); 617-48-1 ((±)-malic acid).



Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ger. also includes the *S*-form ((−)-malic acid).

Ph. Eur. 6.2 (Malic Acid). A white or almost white, crystalline powder. Freely soluble in water and in alcohol, sparingly soluble in acetone.

USNF 26 (Malic Acid). A white or practically white, crystalline powder or granules. Very soluble in water; freely soluble in alcohol.

Profile

Malic acid is used in pharmaceutical formulations as an acidifier, flavour, and as an alternative to citric acid in effervescent powders. It is used with butylated hydroxytoluene as an antioxidant in vegetable oils. It is used topically with benzoic acid and salicylic acid for desloughing of ulcers, burns, and wounds, and systemically with arginine (p.1928) in preparations for the treatment of liver disorders. Pastilles containing malic acid are also used in the management of dry mouth (p.2140).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Acerbine; Leberinfusion; Rocmaline; ***Chile:*** Secand; ***Fin.:*** Xerodent; ***Fr.:*** Rocmaline; Sphingogel†; Squaphane; SST; ***Hung.:*** Rocmalat†; ***Ital.:*** Keraflex; ***Neth.:*** Sterofundin M; ***Norw.:*** Xerodent; ***S.Afr.:*** Aserbine; ***Spain:*** Acerbiol; ***Swed.:*** Xerodent; ***Switz.:*** Acerbine†; ***UK:*** Aserbine†; Hydrotab; Salivix; SST; ***USA:*** Numoisyn; ***Venez.:*** Lecivar Plus.

Mallow

Erdei mályvavirág (mallow flower); Květ slézu lesního (mallow flower); Liść ślazu (mallow leaf); Malvablomma (mallow flower); Malvae folium (mallow leaf); Malvae sylvestris flos (mallow flower); Malvenblätter (mallow leaf); Malvenblüten (mallow flower); Mauve des Bois (*Malva silvestris*); Mauve, feuille de (mallow leaf); Mauve, fleur de (mallow flower); Metsämalvankukka (mallow flower); Miškinių dedešvų žiedai (mallow flower).

Pharmacopoeias. *Eur.* (see p.vii) includes the dried flowers. *Swiss* includes Mallow Leaf (Malvae Folium) which may be *Malva sylvestris* or *M. neglecta*.

Ph. Eur. 6.2 (Mallow Flower; Malvae sylvestris flos). The whole or fragmented dried flower of *Malva sylvestris* or its cultivated varieties. Protect from light.

Profile

Mallow flower and leaf act as demulcents and are ingredients of herbal remedies for coughs and cold symptoms. Mallow flower is used to enhance the colour of herbal teas and other foodstuffs. Mallow is also included in herbal remedies for gastrointestinal disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Mammalian Tissue Extracts

Mamíferos, extractos tisulares.

Экстракты из Млекопитающей Ткани

Profile

Many medicinal preparations with definite pharmacological activity and valid clinical uses are of mammalian origin and are described under their appropriate monographs—for example, calcitonin, corticotropin, hydrocortisone (cortisol), some enzymes, heparin, insulin, parathyroid hormone, pituitary hormones, some sex hormones, and thyroid.

Other preparations of animal origin have been promoted for various disorders. Evidence of pharmacological activity is generally lacking and such preparations are often of doubtful benefit.

Manuka

New Zealand Tea Tree.

Profile

The oil of manuka (*Leptospermum scoparium*) is used for its antimicrobial properties as an alternative to melaleuca oil (p.2338). It is also used in aromatherapy. Manuka honey has also been used as a wound dressing (p.1948).

◊ References.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***UK:*** Antiac; Sinose.

Marjoram

Majoranae Herba; Marjolaine; Sweet Marjoram; Ziele majeranku.

NOTE. Distinguish from wild marjoram (see Oregano, p.2357).

Pharmacopoeias. In *Pol.*

Profile

The dried leaves and flowers of marjoram, *Origanum majorana* (*Majorana hortensis*) (Lamiaceae), and the essential oil obtained from them have antibacterial properties. They are used, either separately or in combination, in herbal remedies for a variety of disorders. Marjoram is also used as a culinary herb.

Marjoram oil is used in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Menodoron; ***Fr.:*** Dystolise; ***Neth.:*** Luuf Verkoudheidsbalsem (voor babies); ***Pol.:*** Salviasept; ***S.Afr.:*** Menodoron; ***Spain:*** Natusor Sinulan†.

Mastic

Almáciga; Mastiche; Mastiksi; Mastix; Pistacijų mastika.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Mastic). The dried resinous exudate obtained from stems and branches of *Pistacia lentiscus* var. *latifolius*. It contains a minimum of 1% v/w of essential oil, calculated with reference to the anhydrous drug. It should not be powdered.

Profile

Solutions of mastic in alcohol, chloroform, or ether have been used, applied on cotton wool, as temporary fillings for carious teeth. Compound Mastic Paint (BP 1980) was formerly used as a protective covering for wounds and to hold gauze in position.

Mastic gum has been used in the management of peptic ulcer disease.

Peptic ulcer disease. Mastic may be effective in the treatment of peptic ulcer disease possibly due to an antibacterial action on *Helicobacter pylori*.[1] However, one small clinical study found no benefit.[2]

Preparations

Proprietary Preparations (details are given in Part 3)

UK: Mastika.

Meadowsweet

Älgört; Filipendulae ulmariae herba; Mesiangervo; Nať tužebníku jilmového; Pelkinių vingiorykščių žolė; Queen of the Meadows; Reina de los prados; Reine des Prés; Reine des prés, sommité fleurie de; Spiraeae Herba; Ulmaria.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Meadowsweet). The whole or cut, dried flowering tops of *Filipendula ulmaria* (*Spiraea ulmaria*). It contains a minimum of 0.1% v/w of steam-volatile substances (dried drug). It has an aromatic odour of methyl salicylate after crushing.

Profile

Meadowsweet is used in herbal medicine as a diuretic and in gastrointestinal and rheumatic disorders.

Homoeopathy. Meadowsweet has been used in homoeopathic medicines under the following names: Filipendula ulmaria; Spiraea ulmaria; Spiraea ulmaria ex herba; Filip. ul.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Cz.:*** Antirevmaticky Caj; ***Fr.:*** Drainuryl; Mediflor Tisane Antirhumatismale No 2; Mediflor Tisane No 4 Diuretique; Polypirine; ***Ital.:*** Flodolor; Neuralta Migren; Pik Gel; Sambuco (Specie Composta)†; Tiglio (Specie Composta)†; ***Mex.:*** Rodan; ***Pol.:*** Reumaherb; ***Spain:*** Dolosul†; Natusor Harpagosinol†; Natusor Renal†; ***Switz.:*** Urinex; ***UK:*** Acidosis; Indigestion Mixture; ***USA:*** Amerigel.

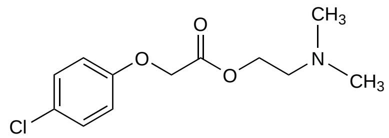
Меклофеноксата Гидрохлорид

$C_{12}H_{16}ClNO_3,HCl = 294.2.$

CAS — 51-68-3 (meclofenoxate); 3685-84-5 (meclofenoxate hydrochloride).

ATC — N06BX01.

ATC Vet — QN06BX01.



(meclofenoxate)

Pharmacopoeias. In *Chin.* and *Jpn.*

Profile

Meclofenoxate hydrochloride has been claimed to aid cellular metabolism in the presence of diminished oxygen concentrations. It has been given mainly for mental changes in the elderly, or after strokes or head injury.

Preparations

Proprietary Preparations (details are given in Part 3)

Austria: Lucidril; ***Ger.:*** Cerutil†; Helfergin†; ***Hung.:*** Helfergin†.

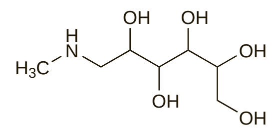
Meglumine *(BAN, rINN)*

Meglumiini; Meglumin; Meglumina; Megluminas; Méglumine; Megluminum. *N*-Methylglucamine; 1-Methylamino-1-deoxy-D-glucitol.

Меглюмин

$C_7H_{17}NO_5 = 195.2.$

CAS — 6284-40-8.



Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), *Int.*, *Jpn*, and *US.*

Ph. Eur. 6.2 (Meglumine). A white or almost white, crystalline powder. Freely soluble in water; sparingly soluble in alcohol; practically insoluble in dichloromethane.

USP 31 (Meglumine). White to faintly yellowish-white, odourless crystals or powder. Freely soluble in water; sparingly soluble in alcohol.

Profile

Meglumine is an organic base used for the preparation of salts of organic acids including many used as contrast media.

Melaleuca Oil

Australian Tea Tree Oil; Melaleuca, aceite de; Mélaleuca, huile essentielle de; Melaleucae aetheroleum; Melaleucae Etheroleum; Mirtenių eterinis aliejus; Oleum Melaleucae; Silice kajeputu střídavolistého; Tea Tree Oil; Teepuuöljy; Teträdolja.

CAS — 68647-73-4; 8022-72-8.

NOTE. Though the synonym Ti-tree Oil has been used for melaleuca oil (e.g. in BPC 1949), the name Ti-tree is also applied to species of *Cordyline* (Liliaceae) indigenous to New Zealand.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Tea Tree Oil). The essential oil obtained by steam distillation from the foliage and terminal branchlets of *Melaleuca alternifolia*, *M. linariifolia*, *M. dissitiflora*, and/or other species of *Melaleuca*. It contains less than 7.0% aromadendrene, less than 15% cineole, 0.5 to 12.0% *p*-cymene, 0.5 to 4.0% limonene, 1.0 to 6.0% α-pinene, less than 3.5% sabinene, 5.0 to 13.0% α-terpinene, 10.0 to 28.0% γ-terpinene, minimum of 30% terpinen-4-ol, 1.5 to 8.0% α-terpineol, and 1.5 to 5.0% terpinolene.

A clear, mobile, colourless to pale yellow liquid with a characteristic odour. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

Profile

Melaleuca oil has bactericidal and fungicidal properties and is used topically for various skin disorders. It is also used in aromatherapy.

Melanocyte-stimulating Hormone

B Hormone; Chromatophore Hormone; Intermedin; Intermedina; Melanotropin; MSH; Pigment Hormone.

CAS — 9002-79-3.

Profile

Melanocyte-stimulating hormone is a polypeptide isolated from the pars intermedia of the pituitary of fish and amphibia which causes dispersal of melanin granules in the skin of fish and amphibia and allows adaptation to the environment.

In adult humans, the pituitary gland lacks a distinct intermediate lobe, and the pituitary is not thought to secrete melanocyte-stimulating hormone (MSH) directly. However, the precursor molecule, pro-opiomelanocortin, is cleaved in the pituitary into corticotropin (p.1523), the glycoprotein β-lipotrophin (β-LPH), and an amino-terminal peptide. Subsequent processing in other tissues, such as the brain and gastrointestinal tract, may yield three forms of MSH, α-MSH (via corticotropin cleavage), β-MSH, and γ-MSH. The presence and function of these melanocyte-stimulating hormones in man are uncertain. A receptor analogous to that in amphibians is apparently lacking in humans; effects on skin pigmentation emanating from the pituitary are primarily mediated by corticotropin.

Release of melanocyte-stimulating hormone is inhibited in *animals* by melanostatin; there is also evidence for a hypothalamic releasing factor (MRF).

Melanocyte-stimulating hormone is under investigation, as α-MSH, in the prevention and treatment of ischaemic intrinsic acute renal failure. A synthetic analogue of α-MSH (4-L-norleucine-7-D-phenylalanine-α-MSH; melanotan-I) is under investigation as a stimulant of melatonin production for the prevention of sunburn.

Melanostatin

Intermedin-inhibiting Factor; Melanocyte-stimulating-hormone-release-inhibiting Factor; Melanostatina; Melanotropin Release-inhibiting Factor; MIF. Pro-Leu-Gly-NH_2.

CAS — 9083-38-9.

Profile

Melanostatin is a tripeptide, obtained from the hypothalamus, that inhibits the release of melanocyte-stimulating hormone (see above) in *animals*. However, there is little evidence of its activity in man. It has been tried in the treatment of depression and parkinsonism but with little benefit.

Melatonin

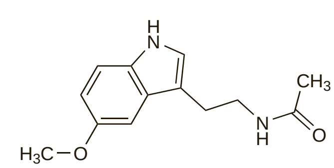
N-Acetyl-5-methoxytryptamine; Melatoniini; Melatonina; Melatoninum. *N*-[2-(5-Methoxyindol-3-yl)ethyl]acetamide.

$C_{13}H_{16}N_2O_2 = 232.3.$

CAS — 73-31-4.

ATC — N05CH01.

ATC Vet — QN05CH01.



Profile

Melatonin is a hormone produced in the pineal gland from the amino acid tryptophan. Results mainly from *animal* studies indicate that melatonin increases the concentration of aminobutyric acid and serotonin in the midbrain and hypothalamus and enhances the activity of pyridoxal-kinase, an enzyme involved in the synthesis of aminobutyric acid, dopamine, and serotonin. Melatonin is involved in the inhibition of gonadal development and in the control of oestrus. It is also involved in protective changes in skin coloration. There appears to be a diurnal rhythm of melatonin secretion; it is secreted during hours of darkness and may affect sleep pattern. Because of its possible role in influencing circadian rhythm, melatonin has been tried in the alleviation of jet lag and other disorders resulting from delay of sleep. Doses of 2 mg given orally before bedtime are used in the short-term management of insomnia in patients aged 55 or over. Melatonin has also been studied in various depressive disorders including seasonal affective disorder, and in large doses for its contraceptive activity.

A number of melatonin analogues are being developed.

Adverse effects. An increase in seizure activity was noted in 4 of 6 children with severe neurological deficits during treatment with melatonin for sleep disorders.[1] Seizure activity returned to baseline values when melatonin was stopped and recurred on rechallenge.

1. Sheldon SH. Pro-convulsant effects of oral melatonin in neurologically disabled children. *Lancet* 1998; **351:** 1254.

Uses. Melatonin has been tried in a number of disorders[1] including, in large doses, as an adjunct to conventional chemotherapy for malignant neoplasms[2,3] and, with norethisterone, as a contraceptive.[4] It is possible that contraceptive use of melatonin may be associated with a reduced risk of breast cancer.[5] For mention of response to melatonin in 2 patients with sarcoidosis, see p.1512. Preliminary studies have also suggested that melatonin may be beneficial in hyperlipidaemias,[6] cluster headaches,[7] tinnitus,[8] alopecia in women,[9] and irritable bowel syndrome associated with sleep disturbances.[10] Repeated bedtime doses may also play a part in reducing nocturnal blood pressure in patients with essential hypertension.[11] Claims for its value as an anti-ageing treatment and for use in conditions such as Alzheimer's disease and AIDS are unfounded.[2,12] The effects of long-term use of melatonin have yet to be assessed.

INSOMNIA. Although melatonin is considered[1-6] to be potentially useful in the management of various forms of insomnia (p.957), especially those associated with circadian rhythm disturbances, there is little evidence of efficacy from large studies and its long-term safety remains to be established. A meta-analysis[7] of randomised controlled studies concluded that melatonin does not have a significant effect on sleep onset latency in secondary sleep disorders or those accompanying sleep restriction such as jet lag and shift work. In healthy subjects melatonin has been reported[8,9] to reduce the time to onset of sleep and to increase the time spent asleep. Whether this is due to adjustment of the 'body clock' or any hypnotic action of melatonin is unclear. Measurement of nocturnal urinary excretion of the major metabolite, 6-sulfatoxymelatonin, demonstrated that low nocturnal melatonin production is associated with insomnia in patients over 55 years of age, and might identify those more likely to respond to treatment with melatonin.[10] Improved quality of sleep has been reported in elderly patients treated with melatonin for insomnia,[11] and it might be of use in delayed sleep phase syndrome[12] and insomnia in shift workers and totally blind people, although some[13,14] have found no beneficial effects of melatonin in night shift workers or emergency medicine employees. There has also been a report[15] of a patient with somnolence associated with melatonin deficiency after pinealectomy who responded to treatment with melatonin. A preliminary report[16] has suggested that use of melatonin may enable benzodiazepine therapy for insomnia to be stopped without impairing the quality of sleep. However, melatonin might adversely affect sleep patterns in some circumstances.[17]

JET LAG. Melatonin has been reported to alleviate jet lag following long flights.[1-4] The most appropriate dosing schedule has yet to be determined but will depend on both the direction of travel and the distance travelled. A systematic review[5] concluded that melatonin was effective in preventing or reducing jet lag in those travelling across 5 or more time zones, particularly in an easterly direction, and especially if jet lag had been experienced previously; travellers crossing 2 to 4 time zones might also derive benefit. However, a meta-analysis[6] of randomised controlled studies concluded that melatonin does not have a significant effect on sleep onset latency accompanying jet lag.

Melilot

Barkūno žolė; Gelber Steinklee; Komonicová nať; Mélilot; Meliloti herba; Rohtomesikkä; Sötväppling; Sweet Clover; Yellow Melilot; Yellow Sweet Clover; Ziele nostrzyka.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Melilot; Meliloti Herba). The whole or cut, dried aerial parts of *Melilotus officinalis*. It contains a minimum of 0.3% coumarin, calculated with reference to the dried drug. Protect from light.

Profile

Melilot is used internally in herbal preparations for chronic venous insufficiency. It contains coumarin (see p.2288) and its derivatives and the dose may be expressed in terms of coumarin. The German expert committee for herbal drugs and preparations (Commission E) also allows the addition or substitution of *M. altissimus* (tall melilot), tall yellow sweet clover.

Melilotus officinalis is also used externally.

Homoeopathy. Melilot has been used in homoeopathic medicines under the following names: Melilotus officinalis; Mel. off.

Melissa

Citromfűlevél; Lemon Balm; Liść melisy; Meduňkový list; Melisa; Meliss; Melissae folium; Mélisse, feuille de; Melissenblatt; Melisų lapai; Sitruunamelissanlehti.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Melissa Leaf). The dried leaf of *Melissa officinalis*. It contains not less than 4% of total hydroxycinnamic derivatives expressed as rosmarinic acid ($C_{18}H_{16}O_8$ = 360.3), calculated with reference to the dried drug. It has an odour reminiscent of lemon. Protect from light.

Profile

Melissa has been used as a carminative and sedative. It is an ingredient of herbal remedies used for a variety of disorders. It is also reported to have virustatic activity. The chief constituent of melissa is citral (p.2284). Hypersensitivity reactions to melissa have been reported.

Melissa is the source of melissa oil (see below).

Homoeopathy. Melissa has been used in homoeopathic medicines under the following names: Melissa officinalis.

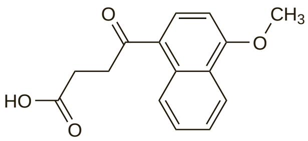
Menbutone *(BAN, rINN)*

Menbuton; Menbutona; Menbutoni; Menbutonum; SC-1749 (menbutone sodium). 4-(4-Methoxy-1-naphthyl)-4-oxobutyric acid.

Менбутон

$C_{15}H_{14}O_4$ = 258.3.
CAS — 3562-99-0.
ATC Vet — QA05AX90.



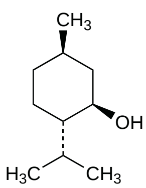
Profile

Menbutone is used as a choleretic to stimulate gastrointestinal function in veterinary medicine.

Menthol

Hexahydrothymol; Mentholum; Mentol; Mentoli; Mentolis. *p*-Menthan-3-ol; 2-Isopropyl-5-methylcyclohexanol.

$C_{10}H_{20}O$ = 156.3.
CAS — 1490-04-6 (menthol); 15356-60-2 ((+)-menthol); 2216-51-5 ((−)-menthol); 89-78-1((±)-menthol).



Description. Menthol is either the laevo-isomer, levomenthol (*BAN*, *rINN*), or a racemic mixture, racementhol (*BAN*, *rINN*). The laevo-isomer may be obtained from the volatile oils of various species of *Mentha* (Labiatae) or it may be prepared synthetically.

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), *Jpn*, *US*, and *Viet. Eur.* and *Jpn* have separate monographs for laevo-menthol (levomenthol) and racemic menthol (racementhol).

Ph. Eur. 6.2 (Levomenthol). It occurs as colourless, acicular or prismatic shiny crystals. M.p. about 43°. Practically insoluble in water; very soluble in alcohol and in petroleum spirit; freely soluble in fatty oils and in liquid paraffin; very slightly soluble in glycerol.

Ph. Eur. 6.2 (Menthol, Racemic; Racementhol BP 2008). It occurs as colourless, acicular or prismatic shiny crystals or as a free-flowing or agglomerated crystalline powder. M.p. about 34°. Practically insoluble in water; very soluble in alcohol and in petroleum spirit; freely soluble in fatty oils and in liquid paraffin; very slightly soluble in glycerol.

USP 31 (Menthol). An alcohol obtained from diverse mint oils or prepared synthetically. It may be laevorotatory (*l*-menthol), from natural or synthetic sources, or racemic (*dl*-menthol). It occurs as colourless, hexagonal crystals, usually needle-like, or in fused masses, or crystalline powder. Has a pleasant, peppermint-like odour. M.p. of *l*-menthol 41° to 44°. Slightly soluble in water; very soluble in alcohol, in chloroform, in ether, and in petroleum spirit; freely soluble in glacial acetic acid, in fixed and volatile oils, and in liquid paraffin. Store in airtight containers preferably at a temperature of 15° to 30°.

Compounding. A liquid or soft mass is formed when menthol is triturated with camphor, cloral hydrate, phenol, and many other substances.

Methods of preparing menthol 1% w/w in aqueous cream BP and the stability of the resultant product have been discussed.[1]

1. Cable C. The preparation of menthol (1 per cent w/w) in aqueous cream BP. *Pharm J* 2005; **274:** 469.

Adverse Effects, Treatment, and Precautions

Menthol may give rise to hypersensitivity reactions including contact dermatitis. Ingestion of significant quantities of menthol is reported to cause symptoms similar to those seen after ingestion of camphor (p.2273), including severe abdominal pain, nausea, vomiting, vertigo, ataxia, drowsiness, and coma; they may be managed similarly. There have been reports (below) of apnoea and instant collapse in infants after the local application of menthol to their nostrils.

Administration to infants. Instillation of decongestant preparations containing menthol directly into the nostrils of infants and young children has resulted in acute respiratory distress with cyanosis[1] and respiratory arrest,[2] and must be avoided. In one case,[1] nasal application was associated with concurrent chemical conjunctivitis.

1. Wyllie JP, Alexander FW. Nasal instillation of 'Olbas Oil' in an infant. *Arch Dis Child* 1994; **70:** 357–8.
2. Blake KD. Dangers of common cold treatments in children. *Lancet* 1993; **341:** 640.

Effects on the nervous system. Ataxia, confusion, euphoria, nystagmus, and diplopia developed in a 13-year-old boy following the inhalation of 5 mL of Olbas oil instead of the recommended few drops.[1] It was considered probable that the menthol in the preparation was responsible for the symptoms; the amount of menthol inhaled was approximately 200 mg.

1. O'Mullane NM, *et al*. Adverse CNS effects of menthol-containing Olbas oil. *Lancet* 1982; **i:** 1121.

Pharmacokinetics

After absorption, menthol is excreted in the urine and bile as a glucuronide.

Absorption. The systemic absorption of camphor, menthol, and methyl salicylate from dermal patches containing all three ingredients has been studied.[1] The absolute bioavailability of these compounds could not be determined from this study, but there did not appear to be any substantial systemic accumulation even after unrealistically high exposure for prolonged periods.

1. Martin D, *et al*. Dermal absorption of camphor, menthol, and methyl salicylate in humans. *J Clin Pharmacol*. 2004; **44:** 1151–7.

Uses and Administration

Menthol is chiefly used to relieve symptoms of bronchitis, sinusitis, and similar conditions. For this purpose it may be used as an inhalation, usually with benzoin or eucalyptus oil, as pastilles, or as an ointment with camphor and eucalyptus oil for application to the chest or nostrils (but see Adverse Effects above). However, as mentioned under the section on the management of cough (p.1547), the use of menthol in inhalations is unlikely to provide any additional benefit.

When applied to the skin menthol dilates the blood vessels, causing a sensation of coldness followed by an analgesic effect. It relieves itching and is used in creams, lotions, or ointments in pruritus and urticaria. It has also been applied to the forehead, presumably as a counter-irritant, for the relief of headache.

In small doses by mouth menthol has a carminative action.

Action. It has been suggested that the apparent benefits of menthol in nasal congestion may be due to an effect on calcium channels of sensory nerves.[1] This mechanism has also been implicated in its muscle relaxant action on the gastrointestinal tract when used as peppermint oil (p.1761).

1. Anonymous. How does menthol work? *Pharm J* 1993; **251:** 480.

Preparations

BP 2008: Levomenthol Cream; Menthol and Benzoin Inhalation;

((−)-menthone)

Profile

Menthone is a constituent of several essential oils. Of the 4 possible stereoisomers of menthone, (−)-menthone (*l*-menthone) is the most abundant in nature. Menthone is reported to be a cholagogue and has been used in preparations for biliary-tract and liver disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Rowachol; ***Braz.:*** Quelodin†; ***Cz.:*** Rowachol; ***Ger.:*** Rowachol; Rowachol comp†; Rowachol-Digestiv; ***Hong Kong:*** Neo-Rowachol; Rowachol; ***Hung.:*** Rowachol; ***Irl.:*** Rowachol; ***Israel:*** Rowachol; ***Malaysia:*** Rowachol; ***Mex.:*** Cholex; ***Philipp.:*** Rowachol; ***Pol.:*** Rowachol; Terpichol; ***Switz.:*** Rowachol; ***Thai.:*** Rowachol; ***UK:*** Rowachol; ***Venez.:*** Rowachol.

Menyanthes

Bitterklee; Bogbean; Buckbean; Folia Trifoli Fibrini; Liść bobrka (bogbean leaf); Marsh Trefoil; Ményanthe; Menyanthidis Folium (bogbean leaf); Menyanthidis trifoliatae folium; Raatteenlehti (bogbean leaf); Trébol de agua; Trèfle d'Eau; Trifolii Fibrini Folium (bogbean leaf); Trilapių pupalaiškių lapai (bogbean leaf); Vachtový list (bogbean leaf); Vattenklöverblad (bogbean leaf); Vidrafűlevél (bogbean leaf).

NOTE. Bog myrtle (see p.2267) has also been used as a common name for *Menyanthes trifoliata*.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Bogbean Leaf). The dried, entire or fragmented leaf of *Menyanthes trifoliata*. It has a very bitter and persistent taste.

Profile

Menyanthes has been used as a bitter. It is used in herbal medicine for rheumatic, gastrointestinal, and biliary-tract disorders. It is also used in folk medicine.

Homoeopathy. Menyanthes has been used in homoeopathic medicines under the following names: Menyanthes trifoliata; Menyan. t.

Mercaptamine *(BAN, rINN)*

Cysteamine *(USAN)*; L-1573; MEA; Mercamine; Mercaptamina; Mercaptaminum; Merkaptamiini; Merkaptamin. 2-Aminoethanethiol.

Меркаптамин

C_2H_7NS = 77.15.
CAS — 60-23-1.
ATC — A16AA04.
ATC Vet — QA16AA04.

NOTE. In the UK, the CSM noted in October 2004 that confusion had arisen between mercaptopurine (p.744) and mercaptamine (formerly cysteamine) after the switch from prescribing by British Approved Name to prescribing by International Nonproprietary Name. Particular care should be taken to distinguish the two, since they are available in oral dosage forms of similar strength.

Mercaptamine Bitartrate *(BANM, rINNM)*

Bitartrato de mercaptamina; Cysteamine Bitartrate; Mercaptamine, Bitartrate de; Mercaptamini Bitartras.

Меркаптамина Битартрат

$C_2H_7NS,C_4H_6O_6$ = 227.2.
CAS — 27761-19-9.
ATC — A16AA04.
ATC Vet — QA16AA04.

Mercaptamine Hydrochloride *(BANM, rINNM)*

CI-9148; Cysteamine Hydrochloride *(USAN)*; Hidrocloruro de mercaptamina; Mercaptamine, Chlorhydrate de; Mercaptamini Hydrochloridum.

Меркаптамина Гидрохлорид

C_2H_7NS,HCl = 113.6.
CAS — 156-57-0.
ATC — A16AA04.
ATC Vet — QA16AA04.

Adverse Effects and Precautions

Mercaptamine can be unpalatable and may cause breath and body odour. It may cause gastrointestinal disturbances including anorexia, nausea, vomiting, diarrhoea, and abdominal pain, and occasionally, gastrointestinal ulceration. Other adverse effects may include drowsiness, lethargy, headache, rashes, fever, and encephalopathy. Mercaptamine may cause increases in liver enzyme values, and there have been some reports of nephrotic syndrome. Nervousness and, sometimes, hallucinations, have also been reported.

Intolerance. Three patients with nephropathic cystinosis developed fever, maculopapular eruption, leucopenia, or headache within 2 weeks of starting mercaptamine at doses of 53, 67, and 75 mg/kg daily by mouth, respectively.[1] These adverse effects resolved within 48 hours of drug withdrawal and all 3 patients were able to tolerate mercaptamine when restarted at a dose of 10 mg/kg daily, slowly increased to therapeutic levels over 2 to 3 months. Higher doses of mercaptamine had been associated with lethargy and seizures.

1. Schneider JA, *et al*. Cysteamine therapy in nephropathic cystinosis. *N Engl J Med* 1981; **304:** 1172.

Pharmacokinetics

◊ Results of a pharmacokinetic-pharmacodynamic study[1] in paediatric patients with nephropathic cystinosis showed that although mercaptamine is rapidly cleared from plasma, dosing every 6 hours was sufficient to maintain the content of cystine in the white blood cells below the target value (see below).

1. Belldina EB, *et al.* Steady-state pharmacokinetics and pharmacodynamics of cysteamine bitartrate in paediatric nephropathic cystinosis patients. *Br J Clin Pharmacol* 2003; **56:** 520–5.

Uses and Administration

Mercaptamine reduces intracellular cystine levels and is given orally as the bitartrate in the treatment of cystinosis (see below); it has also been given as the hydrochloride. Doses are expressed in terms of the base; 2.94 g of the bitartrate or 1.47 g of the hydrochloride are each equivalent to 1 g of mercaptamine. Mercaptamine bitartrate is given in an initial dose that is one-sixth to one-quarter of the expected maintenance dose, and is then increased gradually over 4 to 6 weeks. The usual maintenance dose in adults weighing over 50 kg is 2 g daily in 4 divided doses with or after food. Children up to 12 years of age are given 1.3 g/m^2 (approximately 50 mg/kg) daily in 4 divided doses. Doses are given in conjunction with monitoring of leucocyte-cystine levels which should be kept below 1 nanomol of hemicystine per mg of protein.

Phosphocysteamine, a phosphorothioester of mercaptamine, has been said to be more palatable, and is used similarly.

Mercaptamine facilitates glutathione synthesis and was formerly used intravenously in the treatment of severe paracetamol poisoning to prevent hepatic damage, but other forms of treatment are now preferred (see p.108).

Cystinosis. Mercaptamine and phosphocysteamine (which appears to be rapidly hydrolysed to mercaptamine after ingestion) have been reported to be of benefit in children with cystinosis, a rare autosomal recessive metabolic disorder characterised by the intracellular accumulation of cystine. Cystinosis is marked by growth retardation, rickets, Fanconi syndrome, and renal failure; acute episodes of acidosis and dehydration may develop, and there may be photophobia associated with deposition of cystine in the eye.[1] Use of mercaptamine, which results in a reduction in the concentrations of cystine in leucocytes, has been shown to be effective in controlling many of the symptoms,[2-5] especially if begun early, although it has not been clear from contradictory results[4,6] how much benefit would be seen on renal function. Excellent clinical outcomes were reported[7] on long-term follow-up of 2 siblings with severe nephropathic cystinosis, reinforcing the need for early and diligent treatment in order to avoid progressive renal disease. Compliance may be a problem, because of the taste and odour of mercaptamine, and the more palatable prodrug phosphocysteamine has been developed as an alternative;[8,9] more palatable formulations of mercaptamine are also being investigated. Mercaptamine eye drops are reportedly of benefit in reversing or preventing deposition of corneal cystine crystals.[10] A strength of 0.11% has been used. Renal transplantation may be necessary if renal failure develops.

Mercuric Chloride

Bicloruro de Mercurio; Chlorid rtuťnatý; Cloreto Mercúrico; Corrosive Sublimate; Gyvsidabrio dichloridas; Higany(II)-klorid; Hydrarg. Perchlor.; Hydrargyri dichloridum; Hydrargyri Perchloridum; Hydrargyrum Bichloratum; Kvicksilverdiklorid; Mercuric Chlor.; Mercúrico, cloruro; Mercurique (Chlorure); Mercurique, chlorure; Mercury Bichloride; Mercury Perchloride; Merkuridikloridi; Quecksilberchlorid; Rtęci(II) chlorek.

$HgCl_2$ = 271.5.
CAS — 7487-94-7.
ATC — D08AK03.
ATC Vet — QD08AK03.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Mercuric Chloride). A white or almost white, crystalline powder, or colourless or white or almost white crystals or heavy crystalline masses. Soluble in water and in glycerol; freely soluble in alcohol. Protect from light.

Profile

The use of mercuric chloride as an antibacterial substance is limited by its toxicity, its precipitating action on proteins, its irritant action on raw surfaces, its corrosive action on metals, and by the fact that its activity is greatly reduced in the presence of excreta or body fluids.

Details of the adverse effects of inorganic mercury compounds are provided under Mercury, below.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Spain:*** Pantenil.

Yellow Mercuric Oxide

Gelbes Quecksilberoxyd; Hydrargyri Oxidum Flavum; Hydrargyri Oxydum Flavum; Mercúrico amarillo, óxido; Mercurique (Oxyde) Jaune; Oxido Amarillo de Mercurio; Yellow Precipitate.

HgO = 216.6.
CAS — 21908-53-2.

Pharmacopoeias. In *Fr.* and *It.*

Profile

Yellow mercuric oxide has been used in eye ointments for the local treatment of minor infections including the eradication of pubic lice from the eyelashes. Absorption can occur and produce the adverse effects of inorganic mercury (see Mercury, below).

Pediculosis. Yellow mercuric oxide 1% eye ointment was considered to be a safe and effective treatment in pediculosis (p.2034) of the eyelashes caused by pubic lice (pthiriasis palpebrarum).[1]

1. Ashkenazi I, *et al.* Yellow mercuric oxide: a treatment of choice for phthiriasis palpebrarum. *Br J Ophthalmol* 1991; **75:** 356–8.

Porphyria. Mercuric oxide has been associated with acute attacks of porphyria and is considered unsafe in porphyric patients.

Preparations

Proprietary Preparations (details are given in Part 3)
Austral.: Golden Eye Ointment†; ***Fr.:*** Pommade Maurice.
Multi-ingredient: ***Hung.:*** Dermaforine†; ***India:*** Bell Diono Resolvent; Bell Resolvent.

Mercurous Chloride

Calomel; Calomelanos; Cloreto Mercuroso; Hydrarg. Subchlor.; Hydrargyri Subchloridum; Hydrargyrosi Chloridum; Hydrargyrum Chloratum (Mite); Mercureux (Chlorure); Mercurioso, cloruro; Mercurius Dulcis; Mercury Monochloride; Mercury Subchloride; Mild Mercurous Chloride; Protocloruro de Mercurio; Quecksilberchlorür.

$HgCl$ = 236.0; Hg_2Cl_2 = 472.1.
CAS — 7546-30-7 (HgCl); 10112-91-1 (Hg_2Cl_2).

NOTE. Precipitated Mercurous Chloride (Hydrargyri Subchloridum Praecipitatum), is a white amorphous powder, for which the synonym 'White Precipitate' (Praecipitatum Album) has been used. White Precipitate has also been used as a name for Ammoniated Mercury.

Pharmacopoeias. In *Chin.* as Hg_2Cl_2.

Profile

Mercurous chloride was formerly given as a laxative and was applied topically as an antibacterial. It was one of the mercury compounds employed in the management of syphilis in the pre-antibiotic era.

The mercurous form of mercury does not possess the corrosive properties of the mercuric form and is not absorbed to any great extent. However, the mercurous form can be converted to the mercuric, with consequent toxicity as described under Mercury (see below).

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Hung.:*** Dermaforine†.

Mercury

Hydrarg.; Hydrargyrum; Hydrargyrum Depuratum; Mercure; Mercurio; Quecksilber; Quicksilver; Rtęć.

Hg = 200.59.
CAS — 7439-97-6.
ATC — D08AK05.

Description. Mercury is a shining, silvery white, very mobile liquid, easily divisible into globules, which readily volatilises on heating.

Adverse Effects

Poisoning with liquid mercury or inorganic mercury salts has arisen from sources such as batteries, cosmetics, dental materials, medical equipment, and jewellery manufacture. Barometers, sphygmomanometers, and thermometers are still sources of liquid mercury. Trace amounts of organic and inorganic mercury may also be ingested in the diet.

The effects of **acute** exposure depend on the nature of the compound.

- *Elemental (liquid) mercury* if ingested is poorly absorbed and, unless there is aspiration or pre-existing gastrointestinal disorders, is not considered to be a severe toxicological hazard. The greatest dangers from elemental mercury arise from the inhalation of mercury vapour, which can cause gastrointestinal effects including nausea, vomiting, and diarrhoea; more importantly it is toxic to the respiratory system and this effect can be fatal. Some CNS involvement has also been reported. Adverse effects have also been reported after accidental or intentional parenteral dosage.
- *Inorganic salts* such as mercuric chloride are corrosive when ingested causing severe nausea, vomiting, pain, bloody diarrhoea, and necrosis. The kidney is also involved and tubular necrosis may develop. Mercurous salts are considered to be less hazardous, but the mercurous form can be converted to the mercuric.
- *Organic mercurial compounds* produce similar toxic effects to inorganic compounds, but they have a more selective action on the CNS that has proved difficult to treat. The degree of toxicity varies; those used as preservatives or disinfectants are less toxic than the ethyl or methyl compounds that are not used pharmaceutically or clinically. Methylmercury is notorious for its toxicity; there have been cases of fetal neurotoxicity during outbreaks of methylmercury poisoning.

Chronic mercury poisoning may result from inhalation of mercury vapour, skin contact with mercury or mercury compounds, or ingestion of mercury salts over prolonged periods. It is characterised by many symptoms including tremor, motor and sensory disturbances, mental deterioration, gastrointestinal symptoms, dermatitis, kidney damage, salivation, and gingivitis. A blue line may be present on the gums. There is little difference between acute and chronic poisoning with organic mercurials.

The syndrome of *acrodynia* (pink disease), with symptoms of sweat, rash, erythema of the extremities, photophobia, wasting, weakness, hypertension, tachycardia, and diminished reflexes, occurred in children given mercury in teething powders or in ointments or dusting powders. Such preparations have long since been withdrawn from use. However, the syndrome is still a feature of mercury poisoning from other sources.

Hypersensitivity to mercury and mercurial compounds has been reported.

Mercurialentis has been reported in patients treated with eye drops containing an organomercurial preservative.

Chronic exposure. Acute *occupational exposure* to mercury vapour in 53 men resulted in an initial phase described as metal fume fever, an intermediate phase of severe symptoms with CNS, gastrointestinal, respiratory, and urological involvement, and a late phase with persistent CNS symptoms, dysuria, and pain on ejaculation.[1,2] Although persistent hyperchloraemia was noted in the 11 patients with the highest mercury levels, renal impairment tended to be temporary.[2]

Long-term follow-up of a patient who had an intravenous *injection* of mercury 12 years previously also revealed no persistent renal impairment,[3] despite the presence of mercury microemboli in lungs, kidneys, liver, and subcutaneous tissues and high concentrations in the urine. At this time, the patient had residual reductions in respiratory function, polyneuropathy, and marked asthenozoospermia. Spermatozoal abnormalities may also have contributed to his wife's miscarriage. Mercury deposits mimicking gallbladder cancer were found in the gallbladder of a patient 35 years after he had injected himself with elemental mercury.[4]

Fetal neurotoxicity after *maternal exposure* to methylmercury is well recognised, and there has been widespread concern about the effect of maternal diets on the developing fetus because of mercury concentrations in freshwater and marine organisms. Results from a study in the Faroe Islands showed an association between delays in neurological development in children and maternal consumption of pilot whale meat.[5] Follow-up studies of this population when they reached 14 years of age suggest that the neurotoxic effects of methylmercury might compromise brain development into the teenage years,[6] as well as affecting autonomic regulation of heart function.[7] However, data from a study conducted in a fish-consuming population in the Seychelles failed to find a similar connection.[8]

There has been considerable concern over the systemic absorption of mercury from *dental amalgam*, which typically contains between 40 and 70% of mercury. However, the quantity absorbed from amalgam fillings is reported to be relatively small[9,10] and current evidence suggests that the use of dental amalgam for tooth restoration is both safe and effective.[11-14] The main risks appear to be occupational exposure of dental staff and environmental pollution. Some patients with hypersensitivity to mercury (manifest most commonly as local lichenoid reactions) may benefit from removal of amalgam fillings.[15-17]

Ethylmercury is contained in *thiomersal*, which is used as a preservative in some vaccines for infants and children, thus representing a potential source of mercury exposure. The safety of these vaccines has been a matter of considerable debate worldwide for many years although it is now usually accepted that there is no evidence of neurotoxicity. However, some countries have phased out vaccines containing thiomersal in favour of alternative preservatives. For further details and references, see Thiomersal p.1664.

The symptoms of *acrodynia* have been mistaken for those of phaeochromocytoma.[18-21]

Effects on the kidneys. The kidneys are one of the primary sites for the accumulation of mercury in the body. All forms of mercury (liquid mercury, inorganic mercury, and organic mercury) may be toxic to the kidney although the inorganic forms are the most nephrotoxic.[1]

1. Zalups RK. Molecular interactions with mercury in the kidney. *Pharmacol Rev* 2000; **52:** 113–43.

Hypersensitivity. Systemic contact dermatitis in a patient apparently sensitised by red, mercury-based tattoo pigments, developed when he ate raw swordfish and alfonsino, both renowned for high mercury levels.[1]

1. Tsuruta D, *et al.* A red tattoo and a swordfish supper. *Lancet* 2004; **364:** 730.

Treatment of Adverse Effects

The treatment of **acute** mercury toxicity depends on the form of mercury, the route of exposure, and the dose. Supportive measures may be needed with all types of toxicity. Ingestion of elemental mercury seldom requires active treatment since it is poorly absorbed by this route, although inhalation or aspiration of elemental mercury vapour is a potentially serious problem. Poisoning due to organic mercury is difficult to treat and supportive measures are the mainstay of treatment. Acute exposure to mercury by injection requires mainly supportive therapy, although excision of the affected area has been recommended after subcutaneous or intramuscular injection. Mercurials on the skin should be removed by copious washing with soap and water; for contamination in the eye, irrigation with water at room-temperature for at least 15 minutes should be performed.

Acute oral poisoning due to inorganic mercury salts should be treated if appropriate by activated charcoal or gastric lavage to reduce absorption if within 1 hour of ingestion of a potentially life-threatening dose. Decontamination is not usually necessary after ingestion of small amounts such as elemental mercury from a thermometer. Some inorganic mercury compounds may be corrosive to the gastrointestinal tract when ingested, which can make gastrointestinal decontamination problematic; induction of emesis is not recommended. Gastric decontamination may be tried for organic mercury compounds, although the benefits are uncertain.

In severe cases of toxicity with all forms of mercury poisoning, chelation therapy may be required to facilitate the removal of mercury from the body. Unithiol (p.1468) is the chelating agent of choice in the UK and should be considered in symptomatic patients with a blood-mercury concentration of 100 micrograms/litre, and in asymptomatic patients with a blood-mercury concentration of 200 micrograms/litre. Other chelating agents that may be used are succimer (p.1466), dimercaprol (p.1444), and penicillamine (p.1456). The treatment of choice may vary in other countries depending on local policies and availability of the above chelating agents. Penicillamine may be associated with more adverse effects than other chelating agents and should be reserved for use when others are unavailable or not tolerated. Dimercaprol should be avoided in poisoning with metallic mercury or methylmercury because it may exacerbate neurological effects through redistribution of mercury to the brain from other sites.

Some centres start haemodialysis early in the course of treatment; others wait until renal failure develops. Giving a thiol resin complex to prevent the reabsorption of mercury from the bile has also been tried.

The management of **chronic** toxicity is generally symptomatic although chelation therapy has been used in some patients if the blood-mercury concentration is raised or the patient is symptomatic.

Pharmacokinetics

There is little absorption of elemental mercury from globules in the gastrointestinal tract. The main hazard of elemental mercury is from absorption after inhalation of mercury vapour; this mercury is widely distributed before being oxidised to the mercuric form. Concentrations can be detected in the brain.

Soluble inorganic mercuric salts are absorbed from the gastrointestinal tract and can also be absorbed through the skin. The mercury is distributed throughout the soft tissues with high concentrations in the kidneys; it is mainly excreted in the urine and faeces with an elimination half-life of about 60 days, although it may take years to eliminate mercury from the brain; elimination from other tissues can take several months.

Organic alkyl mercury compounds are more readily absorbed from both the gastrointestinal and the respiratory tracts. They are widely distributed and can produce high concentrations in the brain. Alkyl mercury compounds are excreted in urine and in the faeces with extensive enterohepatic recycling. The biological half-life varies but is longer than that of inorganic mercury.

Organic mercury, and to some extent inorganic mercury, diffuse across the placenta and are distributed into breast milk.

Uses and Administration

The hazards associated with mercury generally outweigh any therapeutic benefit and its clinical use has largely been abandoned. The use of mercurial diuretics such as mersalyl (p.1333) has generally been superseded by other diuretics. Ointments containing mercurials, such as ammoniated mercury (p.1604) have also generally been replaced by less toxic preparations. Mercurials were formerly used as spermicides.

Some ionisable inorganic mercury salts and certain organic compounds of mercury have been used as disinfectants, and some mercury salts are effective parasiticides and fungicides. Organic mercurials such as phenylmercuric acetate, borate, and nitrate are also used as preservatives (p.1657). Mercury is a component of dental amalgams.

Other mercury salts that have been used for their antibacterial activity include mercuric chloride, yellow mercuric oxide, and mercurous chloride (above).

Homoeopathy. Mercury and some mercury compounds have been used in homoeopathic medicines under the following names:

- Mercury: Hydrargyrum metallicum; Mercurius vivus; Merc. viv.
- Mercuric cyanide: Hydrargyrum bicyanatum; Mercurius cyanatus
- Mercuric iodide: Mercurius iodatus flavus; Merc. i. f.
- Red mercuric iodide: Hydrargyrum biiodatum; Mercurius bijodatus; Mercurius iodatus ruber; Merc. i. r.
- Mercuric nitrate: Hydrargyrum nitricum oxydulatum; Mercurius nitricus oxydulatus; Mercurius nitricus; Merc. nit.
- Red mercuric sulfide: Hydrargyrum sulfuratum rubrum; Cinnabaris; Cinbar.
- Ammoniated mercuric nitrate: Mercurius solubilis; Mere. sol.
- Potassium mercuric iodide: Mercurius et kali iodatus; Merc. ki.

See also Ammoniated Mercury (p.1604), Mercuric Chloride (above), and Mercurous Chloride (above).

Preparations

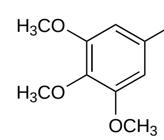
Proprietary Preparations (details are given in Part 3)
Arg.: Lagrimas de Santa Lucia†.

Multi-ingredient: ***Austria:*** Coldophthal; ***Belg.:*** Ocal; ***Spain:*** Oftalmol Ocular.

Mescaline

Mescalina; Mescalinum; Meskaliini; Meskalin. 3,4,5-Trimethoxyphenethylamine.

$C_{11}H_{17}NO_3$ = 211.3.
CAS — 54-04-6.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for mescaline or peyote:
Bad seed; Beans; Big chief; Black button; Blue caps; Britton; Buttons; Cactus; Cactus buttons; Cactus head; Chief; Crystal; Dusty; Full moon; Green button; Half moon; Hikori; Hikula; Hikuli; Hyatari; Indians; M; Mesc; Mesca; Mescal; Mescalito; Mescap; Mescy; Mese; Mess; Mezc; Moon; Musk; Nubs; P; Peyote; Peyotl; Pixie sticks; San Pedro; Seni; Shaman; Topi; Tops.

Profile

Mescaline is an alkaloid obtained from the cactus *Lophophora williamsii* (*Anhalonium williamsii*, *A. lewinii*) (Cactaceae), which grows in the northern regions of Mexico. The cactus is known in those areas by the Aztec name 'peyote' or 'peyotl' and dried slices of the cactus are called 'mescal buttons'.

Mescaline produces hallucinogenic and sympathomimetic effects similar to those produced by lysergide (see p.2335), but it is less potent. Its effects last for up to 12 hours. It has no therapeutic use. Both Mexican and North American Indians have used peyote in religious ceremonies on account of its hallucinogenic activity.

Botulism. Peyote consumed during a ceremonial ritual was believed to have caused botulism in three men.[1] The sample was found to contain type B botulinum toxin when assayed.

1. Hashimoto H, *et al.* Botulism from peyote. *N Engl J Med* 1998; **339:** 203–4.

Mesoglycan Sodium

Mesoglicano sódico.

Profile

Mesoglycan sodium is a mucopolysaccharide complex (glycosaminoglycan) extracted from calf aorta, containing mainly suleparoid (heparan sulfate) (p.1406) and dermatan sulfate (p.1256). It has been claimed to have antithrombotic, antiplatelet, and antihyperlipidaemic properties.

Preparations

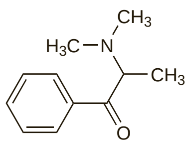
Proprietary Preparations (details are given in Part 3)
Ital.: Perclar†; Prisma; ***Port.:*** Prisma.

Metamfepramone Hydrochloride *(rINNM)* ⊗

Dimepropion Hydrochloride *(BANM)*; Hidrocloruro de metanfepramona; Métamfépramone, Chlorhydrate de; Metamfepramoni Hydrochloridum; Metamfepyramone Hydrochloride. 2-Dimethylaminopropiophenone hydrochloride.

Метамфепрамона Гидрохлорид

$C_{11}H_{15}NO,HCl$ = 213.7.
CAS — 15351-09-4 (metamfepramone); 10105-90-5 (metamfepramone hydrochloride).



(metamfepramone)

Profile

Metamfepramone, the dimethyl analogue of diethylpropion (p.2154), is a sympathomimetic that has been used as the hydrochloride in the treatment of hypotension and in preparations for the symptomatic relief of the common cold. It was formerly used as an anorectic agent.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: *Ger.:* Tempil N.

Metergoline *(BAN, rINN)*

FI-6337; MCE; Metergoliini; Metergolin; Metergolina; Métergoline; Metergolinum; Methergoline. Benzyl (8*S*,10*S*)-(1,6-dimethylergolin-8-ylmethyl)carbamate.

Метэрголин

$C_{25}H_{29}N_3O_2$ = 403.5.
CAS — 17692-51-2.
ATC — G02CB05.
ATC Vet — QG02CB05.

Profile

Metergoline, an ergot derivative, is a dopamine agonist with actions and uses similar to those of bromocriptine (p.798). It is also a serotonin antagonist. Metergoline has been used similarly to bromocriptine in disorders associated with hyperprolactinaemia in usual oral doses of 12 mg daily in divided doses; up to 24 mg daily has been given in hyperprolactinaemic men. It has also been used orally to inhibit lactation, for the treatment of gastrointestinal disorders, and for the prophylaxis of migraine and other vascular headaches.

Hyperprolactinaemia and prolactinomas. Dopamine agonists have been widely used for the treatment of hyperprolactinaemia secondary to a prolactinoma (p.2079). Metergoline has been tried in patients intolerant of bromocriptine.[1] In this report metergoline lowered plasma-prolactin concentrations, although not to normal, in 3 men and 8 women with hyperprolactinaemia. Galactorrhoea was abolished and/or a regular menstrual cycle established in 5 of the women. Prolactin concentrations and symptoms were unchanged in 3 further women with normoprolactinaemic galactorrhoea.

1. Casson IF, *et al.* Intolerance of bromocriptine: is metergoline a satisfactory alternative? *BMJ* 1985; **290:** 1783–4.

Migraine. Although metergoline has been used in some countries for the prophylaxis of migraine (p.616) it is not usually considered to be the drug of choice or even one of the main alternatives.

Preparations

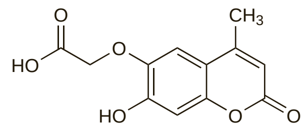
Proprietary Preparations (details are given in Part 3)
Ger.: Liserdol; ***Hong Kong:*** Liserdol†; ***Ital.:*** Liserdol; ***Singapore:*** Liserdol†; ***Switz.:*** Liserdol†.

Metesculetol Sodium *(rINNM)*

Metesculetol sódico; Métesculétol Sodique; Natrii Metesculetolum. [(7-Hydroxy-4-methyl-2-oxo-2*H*-1-benzopyran-6-yl)-oxy]acetate sodium.

Натрий Метэскулетол

$C_{12}H_9NaO_6$ = 272.2.
CAS — 52814-39-8 (metesculetol); 53285-61-3 (metesculetol sodium).



(metesculetol)

Profile

Metesculetol is included in preparations for peripheral vascular disorders and haemorrhoids. Metescufylline is a compound of metesculetol and etamiphylline (p.1120) that has been given by mouth for its reputed vasoprotectant effect.

Preparations

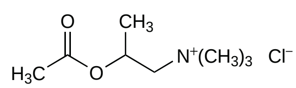
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: *Chile:* Parogencyl Bi-Actif; Vitis Encias Colutorio; Vitis Encias Pasta; ***Fr.:*** Intrait de Marron d'Inde P; Parogencyl gencives fragilisees†; Parogencyl prevention gencives; Parogencyl sensibilite gencives; Veinotonyl; ***Hong Kong:*** Pyodontyl; ***Ital.:*** Parogencyl; Parogencyl Gengive Delicate; ***Mon.:*** Fluon.

Methacholine Chloride *(BAN, rINN)*

Acetyl-β-methylcholine Chloride; Amechol Chloride; Cloruro de metacolina; Méthacholine, Chlorure de; Methacholini Chloridum; Methacholinium Chloratum. (2-Acetoxypropyl)trimethylammonium chloride.

Метахолиния Хлорид

$C_8H_{18}ClNO_2$ = 195.7.
CAS — 55-92-5 (methacholine); 62-51-1 (methacholine chloride).



Pharmacopoeias. In *Fr., Swiss,* and *US.*

USP 31 (Methacholine Chloride). Colourless or white crystals, or a white crystalline powder. It is odourless or has a slight odour, and is very hygroscopic. Soluble 1 in 1.2 of water, 1 in 1.7 of alcohol, and 1 in 2.1 of chloroform. Its solutions are neutral to litmus. Store in airtight containers.

Adverse Effects and Treatment

As for Acetylcholine Chloride, p.1877. Severe adverse cholinergic effects have followed the oral and parenteral use of methacholine and these routes are no longer used.

Precautions

As for Neostigmine, p.632.

Methacholine has the potential to produce severe bronchoconstriction and it should not be used for inhalation challenge tests in patients with clinically apparent asthma, wheezing, or poor pulmonary function.

Methacholine should not be given orally or parenterally.

Interactions

As for Neostigmine, p.632. Methacholine is slowly hydrolysed by acetylcholinesterase, and its effects are markedly enhanced if used after anticholinesterases.

Uses and Administration

Methacholine is a quaternary ammonium parasympathomimetic with the muscarinic actions of acetylcholine (p.1877). It is hydrolysed by acetylcholinesterase at a considerably slower rate than acetylcholine and is more resistant to hydrolysis by non-specific cholinesterases so that its actions are more prolonged.

Inhalation of nebulised solutions of methacholine chloride are used to provoke bronchoconstriction in the diagnosis of bronchial airway hypersensitivity (but see Precautions, above).

Methacholine chloride has been used in eye drops as a miotic for diagnostic purposes.

Methiosulfonium Chloride

Methylmethionine Sulfonium Chloride; Metiosulfonio, cloruro de; Vitamin U. (3-Amino-3-carboxypropyl)dimethylsulphonium chloride.

$C_6H_{14}ClNO_2S$ = 199.7.
CAS — 1115-84-0.
ATC — A02BX04.
ATC Vet — QA02BX04.

Profile

Methiosulfonium chloride has been used for its reputed protective effect on the liver and gastrointestinal mucosa.

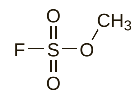
Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: *Hong Kong:* Rudd-U†; ***Jpn:*** Cabagin; Cabe 2; The Guard Seichojo; ***Singapore:*** Weisen-U†.

Methyl Fluorosulfate

Fluorosulfato, metilo de; Magic Methyl; Methyl Fluorosulphate; Methyl Fluorosulphonate.

CH_3FO_3S = 114.1.
CAS — 421-20-5.



Profile

Methyl fluorosulfate has been used as a laboratory methylating agent. Pulmonary oedema has occurred after inhalation, and concern has been expressed concerning possible carcinogenicity.

Methylenedioxycinnamic Acid

3,4-Methylenedioxycinnamic acid.

$C_{10}H_8O_4$ = 192.2.
CAS — 2373-80-0.

Profile

Methylenedioxycinnamic acid and its potassium salt have been used in preparations for the treatment of liver disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: Vacuobil.
Multi-ingredient: *Arg.:* Vacuobil Plus.

Methylhydroxyquinoline Metilsulfate

Methylhydroxyquinoline Methylsulphate; Metilhidroxiquinolina, metilsulfato de. 1-Methyl-8-hydroxyquinolinium methyl sulphate.

$C_{10}H_{10}NO,CH_3O_4S$ = 271.3.

Profile

Methylhydroxyquinoline metilsulfate has been used topically to treat eye irritation.

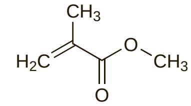
Preparations

Proprietary Preparations (details are given in Part 3)
Belg.: Uvestat; ***Fr.:*** Uveline†.

Methylmethacrylate

Metacrilato de metilo; Méthacrylate de méthyle; Methylis methacrylas. Methyl 2-methylacrylate; Methyl 2-methylpropenoate.

$C_5H_8O_2$ = 100.1.
CAS — 80-62-6.



Adverse Effects and Precautions

Occupational exposure to methylmethacrylate monomer vapour during preparation of the bone cement may irritate the respiratory tract, eyes, and skin. Cases of occupational asthma have been reported. Contact dermatitis, dizziness, nausea and vomiting may also occur. Methylmethacrylate monomer may be harmful to the liver.

Methylmethacrylate monomer acts as a peripheral vasodilator and has caused hypotension and, rarely, cardiac arrest and death when absorbed during the use of polymethylmethacrylate (PMMA) as a bone cement during orthopaedic surgery. Other adverse effects associated with the use of polymethylmethacrylate as a bone cement include thrombophlebitis, pulmonary embolism, haemorrhage, haematoma, short-term irregularities in cardiac conduction, cerebrovascular accident, compression of the spinal cord and/or nerve roots, and new fractures in adjacent non-augmented vertebrae. Recommendations when using PMMA include monitoring with high quality imaging systems to detect leakage, and close monitoring of blood pressure during and immediately after the procedure.

Effects on the nervous system. Sensory polyneuropathy has been reported in a dental technician after occupational exposure to methylmethacrylate monomer.[1]

1. Sadoh DR, *et al.* Occupational exposure to methyl methacrylate monomer induces generalised neuropathy in a dental technician. *Br Dent J* 1999; **186:** 380–1.

Uses and Administration

Methylmethacrylate forms the basis of acrylic bone cements used in orthopaedic surgery. A liquid consisting chiefly of methylmethacrylate monomer with a polymerisation initiator is mixed with a powder consisting of polymethylmethacrylate (PMMA) or a methylmethacrylate ester copolymer. The reaction is exothermic. Barium sulfate or zirconium dioxide may be added as a contrast medium. Polymethylmethacrylate beads containing gentamicin have been implanted for the prophylaxis and treatment of bone infections and some soft-tissue infections. Bone cements containing antibacterials such as gentamicin or erythromycin are also available.

Polymethylmethacrylate has also been used as a material for intra-ocular lenses, for denture bases, as a cement for dental prostheses, and in composite resins for dental restoration.

A number of polymers based on methacrylic acid are used in pharmaceutical technology mainly as film coating agents and binders.

Ph. Eur. 6.2 includes:

- Ammonio Methacrylate Copolymer (Type A) (a copolymer of acrylic and methacrylic acid esters)
- Ammonio Methacrylate Copolymer (Type B) (a copolymer of acrylic and methacrylic acid esters)
- Basic Butylated Methacrylate Copolymer
- Methacrylic Acid-Methyl Methacrylate Copolymer (1:1)
- Methacrylic Acid-Ethyl Acrylate Copolymer (1:1)
- Methacrylic Acid-Ethyl Acrylate Copolymer (1:1) Dispersion 30 per cent
- Methacrylic Acid-Methyl Methacrylate Copolymer (1:2)
- Polyacrylate Dispersion 30 per cent (a dispersion of an ethyl-acrylate-methyl methacrylate copolymer in water)

USNF 26 includes:

- Methacrylic Acid Copolymer (a copolymer of methacrylic acid and an acrylic or methacrylic ester)
- Amino Methacrylate Copolymer
- Ammonio Methacrylate Copolymer
- Ammonio Methacrylate Copolymer Dispersion
- Ethyl Acrylate and Methyl Methacrylate Copolymer

Bone disorders. Polymethylmethacrylate bone cements may be injected percutaneously into vertebral fractures or lesions to relieve pain and stabilise the damaged vertebra.[1-6] The technique has been used in the treatment of metastatic bone lesions and myeloma (p.660 and p.658) as well as for vertebral compression fractures due to osteoporosis (p.1084). Complications[5,7-9] are uncommon but may include both local and systemic effects (including pulmonary embolism) due to leakage of the cement and sudden drop in blood pressure, probably due to the monomer.

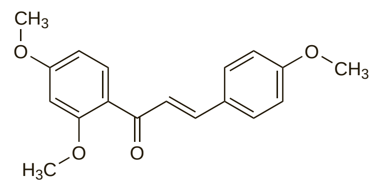
Metochalcone *(rINN)*

CB-1314; Methochalcone; Metocalcona; Métochalcone; Metochalconum; Trimethoxychalcone. 2′,4,4′-Trimethoxychalcone.

Метохалкон

$C_{18}H_{18}O_4$ = 298.3.

CAS — 18493-30-6.



Profile

Metochalcone has been used as a choleretic.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: Spain: Neocolan.

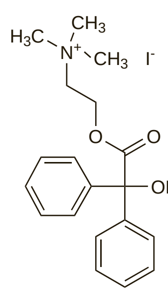
Metocinium Iodide *(pINN)*

Ioduro de metocinio; Metocinii Iodidum; Métocinium, Iodure de. (2-Hydroxyethyl)trimethylammonium iodide benzilate.

Метоциния Йодид

$C_{19}H_{24}INO_3$ = 441.3.

CAS — 2424-71-7.



Profile

Metocinium iodide is used as an antispasmodic.

Metyrapone *(BAN, USAN, rINN)*

Metirapon; Metirapona; Metyrapon; Métyrapone; Metyraponi; Metyraponum; Su-4885 (metyrapone tartrate). 2-Methyl-1,2-di(3-pyridyl)propan-1-one.

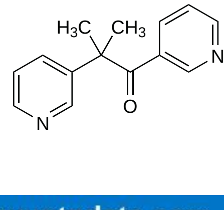
Метирапон

$C_{14}H_{14}N_2O$ = 226.3.

CAS — 54-36-4.

ATC — V04CD01.

ATC Vet — QV04CD01.



Pharmacopoeias. In *Br., Jpn,* and *US.*

BP 2008 (Metyrapone). A white to light amber crystalline powder with a characteristic odour. M.p. 50° to 53°. Sparingly soluble in water; freely soluble in alcohol and in chloroform; it dissolves in dilute mineral acids. Protect from light.

USP 31 (Metyrapone). A white to light amber, fine, crystalline powder, having a characteristic odour. It darkens on exposure to light. Sparingly soluble in water; soluble in chloroform and in methyl alcohol; forms water-soluble salts with acids. Store in airtight containers. Protect from heat and light.

Adverse Effects

Metyrapone may give rise to nausea and vomiting, abdominal pain, headache, sedation, dizziness, hypotension, and hypersensitivity rashes. Hypoadrenalism, hirsutism, and bone marrow depression may occur rarely. Long-term use of metyrapone can cause hypertension.

Alopecia. Reports of alopecia[1,2] associated with administration of metyrapone for Cushing's syndrome.

1. Harris PL. Alopecia associated with long-term metyrapone use. *Clin Pharm* 1986; **5:** 66–8.
2. Harries-Jones R, Overstall P. Metyrapone-induced alopecia. *Postgrad Med J* 1990; **66:** 584.

Precautions

Metyrapone should be used with extreme caution, if at all, in patients with gross hypopituitarism or with reduced adrenal secretory activity because of the risk of precipitating acute adrenal failure. Thyroid dysfunction or liver cirrhosis may alter the response to metyrapone.

Dizziness and sedation may affect the performance of skilled tasks such as driving.

Porphyria. Metyrapone is considered to be unsafe in patients with porphyria because it has been shown to be porphyrinogenic in *in-vitro* systems.

Interactions

Phenytoin is reported to increase the metabolism of metyrapone; doubling the dose of metyrapone may counteract the interaction. However, as many other drugs may interfere with steroid assessment, medication is best avoided where possible during the metyrapone test. Drugs reported to interfere with the metyrapone test include antidepressants such as amitriptyline, antithyroid drugs, antipsychotics such as chlorpromazine, barbiturates, corticosteroids, cyproheptadine, and hormones that affect the hypothalamic-pituitary axis such as oestrogens and progestogens.

Pharmacokinetics

Metyrapone is rapidly absorbed from the gastrointestinal tract. It is metabolised by rapid reduction to metyrapol and excreted in the urine as glucuronide conjugates of metyrapone and metyrapol.

Uses and Administration

Metyrapone inhibits the enzyme 11β-hydroxylase responsible for the synthesis of the glucocorticoids cortisone and hydrocortisone (cortisol) as well as aldosterone from their precursors. The consequent fall in the plasma concentrations of circulating glucocorticoids stimulates the anterior pituitary gland to produce more corticotropin. This, in turn, stimulates the production of more 11-deoxycortisol and other precursors which are metabolised in the liver and excreted in the urine where they can be measured. Metyrapone is therefore used as a test of the feedback hypothalamic-pituitary mechanism in the diagnosis of Cushing's syndrome, although the dexamethasone suppression test (p.1527) may be preferred.

After demonstration of the responsiveness of the adrenal cortex, metyrapone is given orally, usually in a dose of 750 mg every 4 hours for 6 doses. Taking doses with milk or after a meal may minimise the gastrointestinal adverse effects of metyrapone. A suggested oral dose for children is 15 mg/kg, with a minimum dose of 250 mg, every 4 hours for 6 doses. In patients with a normally functioning pituitary gland excretion of 17-hydroxycorticosteroids is increased two- to fourfold and that of 17-ketosteroids about twofold.

Metyrapone is also used in the management of Cushing's syndrome (below) when doses may range from 250 mg to 6 g daily.

Since metyrapone inhibits the synthesis of aldosterone it has been used to treat some cases of resistant oedema; it is given with a glucocorticoid to suppress the normal corticotropin response to low plasma concentrations of glucocorticoids. The suggested usual dosage of metyrapone in resistant oedema is 3 g daily in divided doses.

Metyrapone tartrate has also been used.

Cushing's syndrome. Cushing's syndrome is the result of a chronic excess of glucocorticoids.[1,2] It may be independent of the secretion of adrenocorticotrophic hormone (ACTH; corticotropin), either due to an adrenal tumour secreting cortisol, or to exogenous corticosteroids, or it may be ACTH-dependent, such as Cushing's disease proper, which is caused by excessive ACTH secretion from a pituitary adenoma; other ACTH-dependent forms may be due to pituitary hyperplasia, or an ectopic ACTH-secreting tumour elsewhere—usually bronchus or lung cancer. About two-thirds of all cases are due to Cushing's disease, which is 8 times more common in women than men.

Symptoms may develop insidiously over several years and include obesity, particularly of the trunk, rounding of the face, atrophy of the skin leading to striae, poor wound healing, muscle weakness, osteoporosis, hypertension, diabetes mellitus, and depression and other psychological disturbances. Hypokalaemia is rare in Cushing's disease but common in other forms of the syndrome. Women may have hirsutism due to adrenal androgen secretion, and both sexes may develop hypogonadism and loss of libido.

Diagnosis of Cushing's syndrome can be problematic because no test is wholly reliable.[1,3-6] Where there is suspicion, options for initial screening include measurement of urinary cortisol, late-night salivary cortisol, midnight plasma-cortisol, and overnight low-dose dexamethasone suppression testing. A dexamethasone-corticorelin test may be used to identify pseudo-Cushing's conditions such as depression or alcoholism. Once a diagnosis of Cushing's syndrome has been made, plasma-ACTH measurements are used to distinguish between ACTH-dependent and ACTH-independent forms. High-dose dexamethasone suppression testing and corticorelin stimulation testing have been used to differentiate between pituitary and ectopic ACTH-dependent Cushing's syndrome, but they both have disadvantages and their usefulness has been debated. For further discussion of dexamethasone suppression testing, see p.1527, and for corticorelin stimulation testing, see p.1523. Imaging techniques and sampling of central (petrosal) venous blood are additional procedures that may be used for localising tumours.

Appropriate **treatment** depends on accurate identification of the cause of the syndrome.[1] The usual treatment in Cushing's disease is transsphenoidal resection of the tumour, which when carried out by an experienced surgeon produces a successful response in the majority of patients. Pituitary radiotherapy is slower than surgery to take effect, produces a lower remission rate, and is more likely to produce hypopituitarism. It is therefore usually used as second-line therapy when initial surgery has not been curative and a second operation is considered unsuitable. If pituitary surgery or radiotherapy fails, bilateral adrenalectomy may be considered (although this has some risks including that of Nelson's syndrome due to hyperactivity of residual pituitary tumour). Patients who undergo such surgery require glucocorticoid and mineralocorticoid replacement therapy for life. Surgery is also the treatment of choice for a resectable adrenal tumour or ectopic ACTH-secreting tumour; even where there is metastasis it may be useful in moderating symptoms.

A number of drugs have been used in patients with Cushing's disease, but their role appears to be mainly adjuvant.[1,7] Drugs acting at the hypothalamic-pituitary level, aimed at reducing ACTH secretion, do not seem to be of much value; there have been occasional reports of benefit with bromocriptine, cyproheptadine, and sodium valproate. Drugs that inhibit steroid synthesis in the adrenal gland are more effective, and include mitotane, metyrapone, and ketoconazole. These may be used to control severe complications quickly, prepare patients for surgery, or provide cover while radiotherapy takes effect. Mifepristone acts as a glucocorticoid receptor antagonist, and has been used successfully in a few patients with Cushing's syndrome. Etomidate can be useful for acute control of hypercortisolaemia if the oral route is not available.

In patients with the ectopic ACTH syndrome in whom surgery is unsuitable or ineffective, chemotherapy aimed at the primary tumour is the treatment of choice but is likely to be only palliative. Inhibitors of steroid synthesis can be used to control symptoms, and somatostatin analogues such as octreotide may decrease ACTH secretion by ectopic tumours that have somatostatin receptors.[1]

Surgery is the preferred treatment for an adrenal tumour but, although this is usually curative for adrenal adenoma, it is less successful for adrenal carcinoma.[1]

In patients who are successfully treated for Cushing's syndrome adrenocortical replacement therapy (see p.1498) is usually required until the hypothalamic-pituitary-adrenal axis recovers normal function, a process which may take many months.

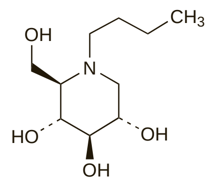
Miglustat *(BAN, USAN, rINN)*

Butyldeoxynojirimycin; *n*-Butyl-deoxynojirimycin; Miglustaatti; Miglustatum; OGT-918; OXAIDS; SC-48334. 1,5-(Butylimino)-1,5-dideoxy-D-glucitol; (2*R*,3*R*,4*R*,5*S*)-1-Butyl-2-(hydroxymethyl)piperidine-3,4,5-triol.

Миглустат

$C_{10}H_{21}NO_4$ = 219.3.
CAS — 72599-27-0.
ATC — A16AX06.
ATC Vet — QA16AX06.



Adverse Effects and Precautions

Diarrhoea and other gastrointestinal disturbances, weight loss, tremor, dizziness, headache, cramps, and visual disturbances are frequent in patients receiving miglustat, and some patients may experience paraesthesias, peripheral neuropathy, or thrombocytopenia. Studies in *animals* have indicated an effect on spermatogenesis; male patients should not attempt conception during, or for 3 months after stopping, treatment. Care is required in renal impairment.

Pharmacokinetics

Miglustat is rapidly absorbed after oral doses with maximum plasma concentrations reached in about 2 hours. It is mainly excreted in the urine with some also excreted in the faeces; the average elimination half-life is 6 to 7 hours.

Food. The average peak plasma concentration was reduced by 37% when miglustat was taken with food by 24 healthy subjects. However, there was no clinically significant effect on the extent of absorption (area under the curve was decreased by 14%).[1] Licensed product information states that miglustat may be taken with or without food.

1. van Giersbergen PLM, Dingemanse J. Influence of food intake on the pharmacokinetics of miglustat, an inhibitor of glucosylceramide synthase. *J Clin Pharmacol* 2007; **47:** 1277–82.

Uses and Administration

Miglustat is an inhibitor of the enzyme glucosylceramide synthase, responsible for the first step in the synthesis of glucosylceramide and most other glycolipids. It is used to help prevent the accumulation of glucosylceramide in patients with mild to moderate type 1 Gaucher disease (p.2249) who cannot be treated with enzyme replacement therapy. The initial dose is 100 mg orally 3 times daily; reduction to 100 mg once or twice daily may be necessary in some patients because of diarrhoea. For details of reduced doses in patients with renal impairment, see below. Miglustat has also been used for the treatment of Niemann-Pick disease, type C.

Administration in renal impairment. The initial dose of miglustat should be reduced in renal impairment according to the patient's creatinine clearance (CC):

- CC 50 to 70 mL/minute per 1.73 m^2: 100 mg twice daily
- CC 30 to 50 mL/minute per 1.73 m^2: 100 mg daily
- CC less than 30 mL/minute per 1.73 m^2: not recommended

Dementholised Mint Oil

Csökkentett mentoltartalmú mezei mentaolaj (partly dementholised mint oil); Menta, aceite esencial desmentolado de; Mentha arvensis, huile essentielle partiellement démentholée de (mint oil, partly dementholised); Menthae arvensis aetheroleum partim mentholum depletum (mint oil, partly dementholised).
CAS — 68917-18-0 (cornmint oil).

Pharmacopoeias. In *Eur.* (see p.vii).
Mentha oil is in *Jpn.*

Ph. Eur. 6.2 (Mint Oil, Partly Dementholised; Menthae Arvensis Aetheroleum Partim Mentholum Depletum; Dementholised Mint Oil BP 2008). The essential oil obtained by steam distillation from the fresh, flowering aerial parts, recently gathered from *Mentha canadensis* (*M. arvensis* var. *glabrata*; *M. arvensis* var. *piperascens*) followed by partial separation of menthol by crystallisation. A colourless or pale yellow to greenish-yellow liquid with a characteristic odour. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

Profile

Dementholised mint oil is used as a flavour. *Mentha arvensis* is used in herbal medicine as a febrifuge and for rheumatic disorders. Cornmint oil, obtained from *M. arvensis*, is used in aromatherapy as an adulterant or substitute for peppermint oil. Peppermint oil (p.1761) and spearmint oil (p.2391) are used as carminatives and flavours.

Miracle Fruit

Fruta milagrosa.

Profile

Miracle fruit is the fruit of *Synsepalum dulcificum* (*Richardella dulcifica*) (Sapotaceae). It contains a glycoprotein 'miraculin' with no apparent taste of its own but which is able to make sour substances taste sweet and to improve the flavour of foods. Its activity is reduced by heating.

Mistletoe

European Mistletoe; Gui; Mistelkraut; Muérdago; Tallo de Muérdago; Visci Caulis; Visci herba; Viscum; Viscum Album.

Pharmacopoeias. In *Ger.*

Profile

Mistletoe is the dried, evergreen, dioecious semi-parasite, *Viscum album* (Loranthaceae), which grows on the branches of deciduous trees, chiefly apple, poplar, and plum. It occurs as a mixture of broken stems and leaves and occasional fruits. Mistletoe has a vasodilator action and has been used in herbal preparations for hypertension and cardiovascular disorders although its activity when taken orally is questionable. It has also been used in nervous disorders.

Mistletoe contains lectins with cytotoxic and immunomodulatory actions *in vitro* and preparations have been given by injection in a number of neoplastic diseases.

Ingestion of the berries and other parts has been reported to cause nausea, vomiting, diarrhoea, and bradycardia.

Homoeopathy. Mistletoe has been used in homoeopathic medicines under the following names: Viscum album; Vis. alb.

◊ A review of mistletoe.[1] There are about 1300 species of mistletoe representing 36 genera of the Loranthaceae, and what is called the "common mistletoe" varies from country to country: in Europe the term describes *Viscum album* while in the USA it describes *Phoradendron flavescens*. The toxicity of aqueous extracts of mistletoe has been found to depend upon the nature of the host plant. Three classes of cytotoxic compounds are present in the leaves and stems of *V. album* although the berries are generally considered to be the most toxic part of the plant. These are alkaloids, viscotoxins, and lectins. The viscotoxins have been shown to cause hypotension, bradycardia, arterial vasoconstriction, and a negative inotropic effect, and may act as acetylcholine agonists. The lectins show toxic effects in *animals* similar to those seen with ricin.

1. Anderson LA, Phillipson JD. Mistletoe—the magic herb. *Pharm J* 1982; **229:** 437–9.

Adverse effects. There have been reports of hepatitis after the ingestion of herbal remedies containing mistletoe.[1,2] Severe delayed hypersensitivity has been reported[3] in a patient given intravenous chemotherapy for breast cancer concurrently with subcutaneous injections of a mistletoe extract. It was thought that mistletoe had stimulated the reaction to methotrexate and gemcitabine.

3. Shaw HS, *et al.* Delayed-type hypersensitivity reaction with Iscador M given in combination with cytotoxic chemotherapy. *J Clin Oncol* 2004; **22:** 4432–4.

Malignant neoplasms. Reviews[1-3] of the use of mistletoe for the treatment of malignant neoplasms revealed that studies have been of variable quality, and have produced conflicting results; it has been suggested that the more rigorous studies do not show benefit.[3] A systematic review[4] of 21 randomised controlled studies found major methodological flaws in most of the studies and concluded that there was insufficient evidence to provide guidelines for the use of mistletoe extracts in oncology.

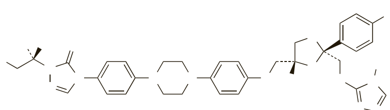
Mitratapide *(USAN, rINN)*

Mitratapid; Mitratapida; Mitratapidum; R-103757. 2-[(2*R*)-Butan-2-yl]-4-(4-{4-[4-({(2*S*,4*R*)-2-(4-chlorophenyl)-2-[(4-methyl-4*H*-1,2,4-triazol-3-ylsulfanyl)methyl]-1,3-dioxolan-4-yl}methoxy)-phenyl]piperazin-1-yl}phenyl)-2,4-dihydro-3*H*-1,2,4-triazol-3-one.

Митратапид

$C_{36}H_{41}ClN_8O_4S = 717.3.$
CAS — 179602-65-4.
ATC Vet — QA08AB90.



Profile

Mitratapide is an inhibitor of the microsomal triglyceride transfer protein. It is used in veterinary medicine as an aid to management of obesity in *dogs*.

Monoctanoin *(BAN, USAN)*

Monoctanoína; Monooctanoin; Mono-octanoin.
CAS — 26402-26-6 (glyceryl mono-octanoate).

Description. Monoctanoin is a semisynthetic mixture of glycerol esters, containing 80 to 85% of glyceryl mono-octanoate ($C_{11}H_{22}O_4$ = 218.3), 10 to 15% of glyceryl mono-decanoate ($C_{13}H_{26}O_4$ = 246.3) and glyceryl di-octanoate ($C_{19}H_{36}O_5$ = 344.5), and a maximum of 2.5% of free glycerol ($C_3H_8O_3$ = 92.09).

Profile

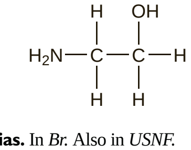
Monoctanoin given by continuous perfusion through a catheter inserted directly into the common bile duct has been used to dissolve cholesterol gallstones (p.2409) retained after cholecystectomy.

Preparations

Proprietary Preparations (details are given in Part 3)
USA: Moctanin†.

Monoethanolamine

2-Hydroxyethylamine; 2-Aminoethanol.
$C_2H_7NO = 61.08.$
CAS — 141-43-5.



Pharmacopoeias. In *Br.* Also in *USNF.*

BP 2008 (Ethanolamine). A clear, colourless, or pale yellow liquid with a slight odour. It is alkaline to litmus. Miscible with water and with alcohol; slightly soluble in ether.

USNF 26 (Monoethanolamine). A clear, colourless, moderately viscous liquid having a distinctly ammoniacal odour. Miscible with water, with alcohol, with acetone, with chloroform, and with glycerol; immiscible with ether, with petroleum spirit, and with fixed oils, although it dissolves many essential oils. Store in airtight containers. Protect from light.

Monoethanolamine Oleate *(rINN)*

Ethanolamine Oleate *(USAN)*; Monoéthanolamine, Oléate de; Monoethanolamini Oleas; Oleato de monoetanolamina. 2-Hydroxyethylamine compound with oleic acid; 2-Aminoethanol compound with oleic acid.

Моноэтаноламина Олеат

$C_2H_7NO,C_{18}H_{34}O_2 = 343.5.$
CAS — 2272-11-9.
ATC — C05BB01.
ATC Vet — QC05BB01.

Adverse Effects and Precautions

Monoethanolamine oleate is irritant to skin and mucous membranes. Local injection may cause sloughing, ulceration, and, in severe cases, necrosis. Pain may occur at the site of injection. Patients receiving treatment for oesophageal varices may develop pleural effusion or infiltration. Hypersensitivity reactions have been reported.

Sclerotherapy should not be used to treat varicose veins of the legs in patients unable to walk, with obese legs, with thrombosis or a tendency to thrombosis, or with acute phlebitis, marked arterial, cardiac, or renal disease, local or systemic infections, or uncontrolled metabolic disorders such as diabetes mellitus. Monoethanolamine oleate should not be used in patients taking oral contraceptives.

Effects on the kidneys. Acute renal failure, which cleared spontaneously within 3 weeks, occurred in 2 obese women given sclerosing injections of 15 to 20 mL of a solution containing monoethanolamine oleate 5% and benzyl alcohol 2%.[1]

1. Maling TJB, Cretney MJ. Ethanolamine oleate and acute renal failure. *N Z Med J* 1975; **82:** 269–70.

Uses and Administration

Monoethanolamine oleate is used as a sclerosant in the treatment of varicose veins and oesophageal varices. For sclerotherapy of varicose veins, 2 to 5 mL of a 5% solution of monoethanolamine oleate is injected slowly into empty isolated sections of vein, divided between 3 or 4 sites. Injection into full veins is also possible. For sclerotherapy of oesophageal varices, the dose is 1.5 to 5 mL of a 5% solution per varix to a maximum total dose of 20 mL per treatment session. Treatment may be given in the initial management of bleeding varices, then repeated at intervals until the varices are occluded.

Variceal haemorrhage. Portal hypertension may occur in many conditions that affect the liver, and leads to the development of collateral channels linking the portal and systemic circulations. Enlargement of such blood vessels beneath the oesophageal and gastric mucosa produces varices which have about a 30% risk of rupture and bleeding. Oesophageal varices are more often a cause of haemorrhage than gastric varices. Capillaries and veins in the gastric mucosa may also become swollen, a condition known as portal hypertensive gastropathy, and clinically important bleeding may occur in severe cases.

Variceal haemorrhage is usually severe, with mortality as high as 50% for the initial episode; the recurrence rate may be as high as 100% in patients who survive without treatment. Bleeding may stop spontaneously, but in those who continue to bleed, control of haemorrhage is difficult and patients should be referred to a centre with appropriate specialist facilities. Treatment to stabilise the patient may be necessary before they can be safely transferred.

Acute management. Initial treatment is supportive and requires measures to prevent aspiration and maintain a clear airway, and volume replacement with colloid and blood. Emergency endoscopy should be performed to establish the site of haemorrhage and exclude non-variceal sources of bleeding. The choice of treatment depends on the site of haemorrhage.[1-9] ***Endoscopic methods*** have been favoured for initial management. Injection sclerotherapy or banding ligation are used for bleeding oesophageal varices but the optimum management of bleeding gastric varices remains to be defined; the value of injection sclerotherapy varies with their location. Intravariceal injection of bovine or human thrombin, or cyanoacrylate tissue adhesives, has been used in gastric varices. Where the source of haemorrhage is non-variceal and due to gastropathy, portal decompressive surgery is effective, although it is associated with a high incidence of encephalopathy in cirrhotic patients. Small studies have shown propranolol to be effective in arresting haemorrhage.[10]

Injection sclerotherapy for variceal haemorrhage may be performed during the emergency endoscopy procedure. Intravariceal injection, paravariceal injection, or a combination of the two have been used. The most widely used sclerosants are monoethanolamine oleate and sodium tetradecyl sulfate for intravariceal injection and lauromacrogol 400 for paravariceal injection. Sclerotherapy controls bleeding in up to 95% of cases. Ulceration and stricture formation occur frequently following injection sclerotherapy.

An alternative technique is ***endoscopic banding ligation***, where elastic bands are placed around the varices. The tissue subsequently necroses to leave a superficial ulcer. This technique is more successful than injection sclerotherapy, but may be more difficult to perform if active bleeding is occurring. Procedures may be repeated if bleeding continues or restarts.

Where endoscopy is unavailable, drug therapy or balloon tamponade may be used until the patient can be transferred to a specialist centre. These techniques may also have a role when sclerotherapy fails and some have suggested that initial drug therapy may be preferable to sclerotherapy[11] or endoscopy.[12]

Drug therapy is aimed at controlling portal venous pressure, although it is ineffective in massive haemorrhage and its effects cease once the drug is stopped. Two meta-analyses[11,13] have examined data from studies comparing drug therapy with endoscopic methods for the treatment of acute variceal bleeding. Sclerotherapy did not appear to be superior to vasoactive drugs as the first single treatment, and was associated with more frequent adverse effects.[11] Adjunctive drug therapy improved the efficacy of endoscopic therapy (injection sclerotherapy or band ligation) compared with endoscopic methods alone, although overall mortality was not affected; severe adverse effects were similar in both groups.[13]

Drugs used include vasopressin and its analogue terlipressin and, more recently, somatostatin and its analogue octreotide. Vasopressin controls haemorrhage in about 50% of patients. It is given by continuous intravenous infusion, together with glyceryl trinitrate, which counteracts the adverse cardiac effects of vasopressin, while potentiating its reduction of portal pressure. Terlipressin has the advantage of a longer therapeutic action, enabling bolus doses to be given. A comparison[14] of terlipressin and sclerotherapy found them to be equally effective for the control of acute variceal bleeding. A systematic review[15] of studies comparing terlipressin with placebo, or other drugs or interventions, also gave favourable results. However, somatostatin,[2] and particularly octreotide,[2,16,17] which may be given by bolus injection, are now generally preferred as they are thought to have similar efficacy to vasopressin but fewer adverse effects. A meta-analysis[18] of studies comparing somatostatin or its analogues octreotide and vapreotide with either placebo or no drug treatment suggested a small benefit in controlling bleeding; however, no mortality benefit has yet been shown. Clinical studies with recombinant factor VIIa to control acute variceal bleeding have produced beneficial results.[12]

Balloon tamponade controls bleeding by direct pressure on the varices. Although it is a very effective means of controlling haemorrhage, there is a high incidence of rebleeding once pressure is removed and the incidence of complications is high. It is useful in cases of massive haemorrhage when drug therapy is ineffective and sclerotherapy is difficult.

Surgery, such as the formation of a shunt or oesophageal transection, may be necessary if the above measures fail to control the bleeding. However, such techniques have been associated with high mortality in some series. Formation of a transjugular intrahepatic portal-systemic shunt (TIPS) is now generally preferred.[4] It may be particularly useful in candidates for liver transplantation. Limited data suggest that the shunt may remain patent in the majority of patients for at least 3 years.[19]

Short-term ***antibacterial prophylaxis*** has been proposed[20] for cirrhotic patients with gastrointestinal bleeding, including variceal bleeding, because reduced rates of infection and improved short-term survival have been reported in a few studies, although there is no benefit on overall mortality.[21]

Long-term management. Once the acute bleeding has been controlled measures are needed to prevent rebleeding. Endoscopic therapy is widely used, with injection sclerotherapy or banding ligation being repeated until the varices are obliterated. Banding ligation is now the treatment of choice; it eradicates varices in fewer treatment sessions than injection sclerotherapy and reduces the risk of ulceration and stricture formation.[22,23] Sucralfate has been given following sclerotherapy as it may reduce the frequency of stricture formation and reduce bleeding from treatment-related ulcers. It seems to have no influence on ulcer healing following banding ligation.[24] Some practitioners carry out regular endoscopic checks and repeat sclerotherapy or banding ligation when varices reappear, although this approach is no more effective in terms of improving survival than giving treatment once bleeding occurs. Drug therapy is an alternative to endoscopic methods.[25] Beta blockers (mainly propranolol) reduce the incidence of recurrent variceal bleeding and may improve survival.[23,26,27] A combination of nadolol with isosorbide mononitrate has been reported to reduce the risk of rebleeding more than repeated sclerotherapy, although there was no significant effect on mortality.[28] Drug therapy has also been used as an adjunct to endoscopic methods to control rebleeding in the period before variceal obliteration has occurred, or for long-term management following endoscopic therapy. However, studies comparing endoscopic band ligation with combination drug therapy have produced variable results.[29] Long-term octreotide therapy following sclerotherapy has also been investigated and may reduce recurrent variceal bleeding.[30] Several studies[31-33] have compared TIPS with endoscopic treatment, but no clear benefit has been demonstrated and there may be an increased risk of encephalopathy with the use of shunts. Surgery, including liver transplantation, should be considered in patients with recurrent life-threatening haemorrhage. Propranolol may also have a role in patients with portal hypertensive gastropathy. In a controlled study, propranolol reduced the incidence of recurrent bleeding from portal hypertensive gastropathy in patients with cirrhosis.[34]

Prophylaxis of a first bleed in patients with portal hypertension is controversial since about 70% of patients who have varices will never bleed, but should probably be given to patients with cirrhosis and varices thought to be at high risk of bleeding. A reliable system that will identify those at high risk of haemorrhage has yet to be devised. The NIEC (North Italian Endoscopic Club) system is probably the best so far,[35,36] and is based on size of the varices, presence of red wale marks on the varices, and Child-Pugh class; amendments to improve the traditional index have been suggested.[36] Sclerotherapy had been considered as a method of prophylaxis, but its value has not been clearly established. Studies show that beta blockers decrease the incidence of a first bleed[27,37] and are probably the treatment of choice if prophylaxis is to be given. Banding ligation may be a suitable alternative for patients who are unable to take beta blockers.[38] Others consider banding ligation to be the standard therapy for prophylaxis.[9] A meta-analysis[39] of 9 randomised controlled studies concluded that variceal banding ligation was superior to beta blockers in preventing a first variceal bleed, whereas a systematic review[40] of 16 randomised controlled studies found both treatments to be effective and suggested that the estimated effect of banding ligation in some studies may be biased and was associated with shorter duration of follow-up.

It is postulated that a reduction in portal pressure to below 12 mmHg is necessary to reduce the incidence of variceal bleeding and that treatment with beta blockers alone does not achieve this. More effective drugs are being sought, and isosorbide mononitrate[9,41,42] (as adjunctive therapy with a beta blocker) and clonidine[43] have been investigated for the prophylaxis of a first bleed and prevention of recurrent haemorrhage in patients with portal hypertension.

Varicose veins. Varicose veins are tortuous, protruding veins in the legs, that occur when weak vein walls and valve incompetence result in venous reflux and dilatation. Symptoms associated with varicose veins include heaviness, tension, aching, and itching of the legs. Complications include oedema, thrombophlebitis, deep venous thrombosis, lipodermatosclerosis, and venous ulceration. Risk factors for varicose veins include increasing age, pregnancy, and occupations that involve prolonged standing.[1]

The management of varicose veins has been reviewed.[1-3] Conservative management using compression hosiery may be effective for relief of symptoms in some patients but longer-term compliance is poor.[3] Surgery or sclerotherapy are other treatment options, depending on the veins affected. Surgical treatment, which is the gold standard for treatment of more severe varicose veins, may involve ligation of the affected vein, stripping of the affected stem vein, or avulsions of the varicosities.[3] In sclerotherapy, which may be the treatment of choice for thread veins,[2] a sclerosant is injected into the affected vein where it irritates and damages the lining of the vein causing local thrombosis, fibrosis, and stenosis. Detergent sclerosants include monoethanolamine oleate, sodium tetradecyl sulfate, lauromacrogol 400, and sodium morrhuate; osmotic sclerosants include hypertonic sodium chloride solutions, and hypertonic mixtures of sodium chloride and glucose; caustic sclerosants include chromated glycerol, and a mixture of iodine and sodium iodide. Graduated compression dressings are usually applied after sclerotherapy to minimise the time taken for the surrounding tissue to absorb the damaged segment of vein. Compression may also help to reduce complications of sclerotherapy including hyperpigmentation, oedema, aching, thrombophlebitis, and deep venous thrombosis. A systematic review[4] of randomised controlled trials of injection sclerotherapy failed to determine its place in the overall management of varicose veins, since the type of sclerosant, formulation, local pressure dressing, or degree and length of compression do not appear to have a significant effect on efficacy. However, the evidence supports its current place in practice, which is in the treatment of recurrent varicose veins following surgery, and thread veins. In another systematic review,[5] the use of surgery or sclerotherapy for the management of primary varicose veins was compared. There was a tendency for better early outcomes with sclerotherapy whereas surgery produced more long-term benefits. However, there was insufficient evidence to recommend the use of one form of treatment over the other, and the extent of the varicose veins ultimately governs the choice.

New methods of treatment being tried include foam sclerotherapy, in which a detergent-like sclerosant is mixed with air to create a foam,[2] ambulatory phlebectomy, endovenous laser therapy, and radiofrequency ablation.[3,6]

Preparations

BP 2008: Ethanolamine Oleate Injection.

Proprietary Preparations (details are given in Part 3)
Braz.: Ethamolin; ***Jpn:*** Oldamin; ***USA:*** Ethamolin.

Monosodium Glutamate

Chinese Seasoning; E621; Glutamato monosódico; MSG; Natrii Glutamas; Sodium Glutamate. Sodium hydrogen L-(+)-2-aminoglutarate monohydrate.

$C_5H_8NNaO_4,H_2O = 187.1.$

CAS — 142-47-2 (anhydrous monosodium glutamate).

Pharmacopoeias. In *Chin.* Also in *USNF.*

USNF 26 (Monosodium Glutamate). White, practically odourless, free-flowing crystals or crystalline powder. It may have either a slightly sweet or slightly salty taste. Freely soluble in water; sparingly soluble in alcohol. pH of a 5% solution in water is between 6.7 and 7.2. Store in airtight containers.

Profile

Monosodium glutamate is widely used as a flavour enhancer and imparts a meaty flavour.

In susceptible individuals, ingestion of foods containing monosodium glutamate may cause MSG symptom complex, a condition characterised by burning sensations, or numbness, in the back of the neck and arms, tingling or warmth or weakness in the face, back and neck, facial pressure, chest pain, headache, nausea, drowsiness or weakness. In patients with asthma, who may be predisposed to develop this condition, bronchospasm may occur. The symptoms tend to occur within an hour of eating 3 g or more of monosodium glutamate on an empty stomach.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Chile:*** Glutacyl Vitaminado; ***Thai.:*** Hemo-Cyto-Serum.

Motherwort

Agripalma; Agripaume, herbe de; Hjärtstilla; Leonuri cardiacae herba; Leonuri Herba; Leonurus; Motherwort Herb; Nukula; Srdečníková nat'; Sukatžolių žolė.

Pharmacopoeias. In *Eur.* (see p.vii). *Chin.* includes the fruit.

Ph. Eur. 6.2 (Motherwort). The whole or cut, dried, flowering aerial parts of *Leonurus cardiaca.* It contains not less than 0.2% of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$ = 464.4) calculated with reference to the dried drug. Protect from light.

Profile

Motherwort is given in herbal medicine for nervous and cardiac disorders; it is also used in products promoted for mild hyperthyroidism.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Austral.:*** Pacifenity†; Valerian†; ***Austria:*** Thyreogutt; ***Canad.:*** Thunas Tab for Menstrual Pain†; ***Fr.:*** Biocarde; ***Ger.:*** Biovital Aktiv†; Biovital Classic; Mutellon; Oxacant N†; Oxacant-sedativ; ***Hung.:*** Biovital†; ***Pol.:*** Biovital N; Klimax†; Lumewal; Nervinolum; Nerwobonisol; ***Switz.:*** Tisane pour le coeur et la circulation; ***UK:*** Menopause Relief; Modern Herbals Stress; Period Pain Relief; Prementaid; Quiet Life; SuNerven; Wellwoman.

Moxaverine Hydrochloride *(BANM, rINNM)*

Hidrocloruro de moxaverina; Meteverine Hydrochloride; Moxavérine, Chlorhydrate de; Moxaverini Hydrochloridum. 1-Benzyl-3-ethyl-6,7-dimethoxyisoquinoline hydrochloride.

Моксаверина Гидрохлорид

$C_{20}H_{21}NO_2,HCl = 343.8.$

CAS — 10539-19-2 (moxaverine); 1163-37-7 (moxaverine hydrochloride).

ATC — A03AD30.

ATC Vet — QA03AD30.

Profile

Moxaverine hydrochloride has a similar structure to papaverine (p.2191) and has been given by mouth and injection as an antispasmodic and in vascular disorders. The base is also used as an antispasmodic.

Doses of moxaverine hydrochloride of up to 300 mg three times daily by mouth have been suggested for the treatment of vasospastic disorders; it has also been given by intravenous infusion.

Much lower doses have been recommended for the treatment of gastrointestinal and biliary-tract spasm.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: Certonal†; Kollateral.

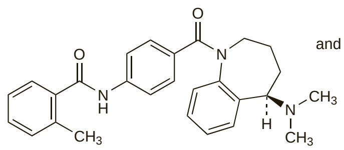
Multi-ingredient: ***Austria:*** Hedonin.

Mozavaptan *(rINN)* ⊗

Manavaptan; Mozavaptán; Mozavaptanum; OPC-31260. *N*-(4-{[(5*RS*)-5-(Dimethylamino)-2,3,4,5-tetrahydro-1*H*-1-benzazepin-1-yl]carbonyl}phenyl)-2-methylbenzamide.

Мозаваптан

$C_{27}H_{29}N_3O_2$ = 427.5.
CAS — 137975-06-5.



and enantiomer

Profile

Mozavaptan is a selective vasopressin V_2-receptor antagonist used for the treatment of hyponatraemia in cancer-related syndrome of inappropriate antidiuretic hormone secretion.

Mulungu

Profile

The bark of the mulungu tree, *Erythrina verna* (*E. mulungu*) Fabaceae, has traditionally been used in South America as a sedative and as a hypotensive.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Braz.:*** Anevrase†; Calmapax; Elixir de Passiflora†; Passaneuro; Passicalm†; Passiflora Composta†; Passilex†; Sedalin†; Xarope Sao Joao†.

Mumps Skin Test Antigen

Parotiditis, prueba cutánea contra el antígeno de la.

Pharmacopoeias. In *US.*

USP 31 (Mumps Skin Test Antigen). A sterile suspension of formaldehyde-inactivated mumps virus prepared from the extra-embryonic fluid of virus-infected chick embryos, concentrated and purified by differential centrifugation, and diluted with isotonic sodium chloride solution. It contains a preservative and glycine as a stabilising agent. Each mL contains not less than 20 complement-fixing units. It should be stored at 2° to 8°. The expiry date is not later than 18 months after date of manufacture or of release from manufacturer's cold storage.

Profile

Recovery from mumps produces skin hypersensitivity to mumps virus. Mumps skin test antigen, has been used with other antigens to assess the status of cell-mediated immunity. A positive reaction may indicate previous infection with mumps virus but it is not considered to be very reliable. It should not be given to patients hypersensitive to egg protein.

Preparations

USP 31: Mumps Skin Test Antigen.

Proprietary Preparations (details are given in Part 3)
USA: MSTA†.

Muramidase Hydrochloride

N-Acetylmuramide Glycanohydrolase Hydrochloride; E1105 (muramidase); Globulin G_1 Hydrochloride; Lysozyme Hydrochloride; Muramidasa, hidrocloruro de.

CAS — 9001-63-2 (muramidase); 9066-59-5 (muramidase hydrochloride).
ATC — D06BB07; J05AX02.
ATC Vet — QD06BB07; QJ05AX02.

Pharmacopoeias. In *Jpn.*

Profile

Muramidase is a mucopolysaccharidase normally present in saliva and other tissues and secretions. It is active against Gram-positive bacteria, possibly by transforming the insoluble polysaccharides of the cell wall to soluble mucopeptides. It is also thought to be active against some viruses and some Gram-negative bacteria.

Muramidase has been given, usually as the hydrochloride, to patients with herpes zoster and other painful viral infections, and for mouth and respiratory-tract disorders. It has been used with antibacterials in an attempt to enhance their activity. Sensitivity reactions have been reported.

Adverse effects. A report[1] of a toxic epidermal necrolysis-type drug eruption in a patient who took an oral cold preparation containing muramidase chloride, which was considered to be the probable cause. The patient's condition improved after intravenous corticosteroid therapy.

1. Kobayashi M, *et al.* A case of toxic epidermal necrolysis-type drug eruption induced by oral lysozyme chloride. *J Dermatol* 2000; **27:** 401–4.

Preparations

Proprietary Preparations (details are given in Part 3)
Belg.: Murazyme; ***Braz.:*** Murazyme†; ***Hong Kong:*** CP-Lyso; Eurozyme; Flemizyme; Jemizym†; Leftose; Lysosmin; Neuzym; ***Ital.:*** Immunozima†; ***Jpn:*** Leftose; Neuzym; ***Malaysia:*** Leftose†; Neuzym; Noflux; ***Singapore:*** Leftose; Lyzyme; Neuflo; Neuzyme; ***Thai.:*** Leftose.

Multi-ingredient: ***Arg.:*** Bim†; Gammanova†; ***Braz.:*** Colpistar; Tricomax; Trinotrex†; ***Cz.:*** Larypront†; ***Fr.:*** Cantalene; Glossithiase; Hexalyse; Lyso-6; Lysopaine; ***Ger.:*** Frubienzym; ***Gr.:*** Lyso-6; Lysopaine; Sopain-Plus; ***Hong Kong:*** Hexalyse; Quadezyme; ***Ital.:*** Narlisim; ***Port.:*** Narizima; ***Rus.:*** Hexalyse (Гексализ); Lysobact (Лизобакт); ***Singapore:*** Biotene; ***Spain:*** Egarone†; Espectral†; Lizipaina; Normo Nar†; Pulmotropic; Rino Dexa; Trofalgon; ***Switz.:*** Arbid-top; Gem; Lyso-6†; Lysopaine; Mebucasol f; Sangerol; ***Thai.:*** Siduol; ***UK:*** Biotene Dry Mouth; BioXtra†; ***USA:*** Biotene with Calcium.

Poisonous Mushrooms or Toadstools

Champignons vénéneux; Giftpilze; Setas venenosas.

CAS — 23109-05-9 (α-amanitin); 21150-22-1 (β-amanitin); 21150-23-2 (γ-amanitin); 58919-61-2 (coprine); 16568-02-8 (gyromitrin); 2552-55-8 (ibotenic acid); 60-34-4 (methylhydrazine); 300-54-9 (muscarine); 2763-96-4 (muscimol); 37338-80-0 (orellanine); 17466-45-4 (phalloidin); 28227-92-1 (phalloin); 39412-56-1 (phallolysin).

Classification

This monograph describes poisonous mushrooms often known as toadstools, their toxins, toxic effects, and the treatment of those effects. Their only use is in homoeopathic medicine (see below). *Amanita muscaria* and *Psilocybe* spp. are abused for their psychoactive properties (see also Psilocin, p.2375).

Mushrooms can be classified into 8 groups according to their principal toxins and toxic effects:

- *Group I.* Most deaths due to mushroom poisoning follow the ingestion of mushrooms containing cyclopeptides and among these mushrooms *Amanita phalloides* ('death cap') has been reported to be responsible for 90% of all mushroom fatalities. The cyclopeptides are a group of heat-stable cyclic polypeptides with molecular weights ranging from 800 to 1100 and include the amatoxins (α-, β-, γ-amanitin) and phallotoxins (phalloidin, phaloin, phallolysin). Other mushrooms containing cyclopeptides include *A. verna* ('deadly agaric', 'fool's mushroom'), *A. virosa*, ('destroying angel') and *A. bisporigera* ('white destroying angel'), and *Galerina autumnalis*, *G. marginata*, and *G. venenata*.
- *Group II.* Although *A. muscaria* ('fly agaric') and *A. pantherina* ('panther cap', 'false blusher') may contain small amounts of muscarine, the antimuscarinic effects of the hallucinogenic agent muscimol and the insecticidal agent ibotenic acid usually predominate.
- *Group III.* Many species of *Gyromitra* contain toxins known as gyromitrins that decompose to release methylhydrazine (monomethylhydrazine; MMH) an inhibitor of the coenzyme pyridoxal phosphate.
- *Group IV.* Mushrooms whose principal toxin is muscarine include many of the *Clitocybe* and *Inocybe* spp. *A. muscaria* and *A. pantherina* (see above) may also contain small amounts.
- *Group V. Coprinus atramentarius* ('ink cap') contains the compound coprine, one of whose metabolites is an inhibitor of acetaldehyde dehydrogenase and it may therefore produce 'disulfiram-like' symptoms after drinking alcohol.
- *Group VI.* Mushrooms that may contain the hallucinogenic indoles psilocin and psilocybin include species of *Psilocybe*, *Panaeolus*, *Gymnopilus*, *Stropharia*, and *Conocybe*.
- *Group VII.* Many mushrooms that only act as gastrointestinal irritants and do not produce systemic effects are included in this group.
- *Group VIII.* A further group has sometimes been used to classify some species of *Cortinarius* that contain a renal toxin thought by some to be orellanine, but whose exact nature remains to be determined.

Adverse Effects

The clinical course of poisoning due to mushrooms is related to their principal toxins:

- *Group I.* Initial symptoms may occur 6 to 24 hours after ingestion of mushrooms containing cyclopeptides, and usually consist of gastrointestinal effects such as abdominal pain, nausea, severe vomiting, and profuse diarrhoea similar to that in cholera. The patient may then appear to recover and be symptom-free for 2 to 3 days, although liver-enzyme values may be increasing. After this phase, the more serious toxic effects of the amatoxins become apparent and there are signs of hepatic, renal, cardiac, and CNS toxicity. Symptoms include jaundice, oliguria, anuria, hypoglycaemia, coagulopathies, circulatory collapse, convulsions, and coma. The mortality rate is high in this third phase, with death usually being due to hepatic failure following hepatic necrosis. Up to 90% of untreated patients may die, though the rate can be as low as 15 to 30% after treatment.
- *Group II.* The adverse effects of mushrooms containing ibotenic acid and muscimol usually occur within 2 hours of ingestion. Symptoms may include ataxia, euphoria, delirium, and hallucinations associated with other antimuscarinic effects. Fatalities are rare.
- *Group III.* Patients who have ingested mushrooms containing gyromitrins usually develop symptoms of poisoning within 6 to 24 hours. These consist initially of nausea, vomiting, abdominal pain, and muscle cramps, headache, dizziness and fatigue. Delirium, convulsions, coma, methaemoglobinaemia and haemolysis may also occur. Occasionally jaundice and hepatic necrosis lead to hepatic failure and death. Up to 40% of patients die.
- *Group IV.* Symptoms typical of 'cholinergic crisis' (see Adverse Effects of Neostigmine, p.631) may appear about 30 minutes to 2 hours after ingestion of mushrooms containing muscarine. These include bradycardia, bronchospasm, salivation, perspiration, lachrymation, rhinorrhoea, involuntary urination and defaecation, and diarrhoea. Miosis, hypotension, and cardiac arrhythmias may also occur. Rarely death may follow due to cardiac arrest or respiratory-tract obstruction.
- *Group V.* Since one of the metabolites of coprine is an acetaldehyde dehydrogenase inhibitor, drinking alcohol, even up to several days after ingestion of mushrooms containing this compound, will produce symptoms similar to those of the 'disulfiram-alcohol' interaction (see Disulfiram, Adverse Effects, p.2296). Fatalities are rare.
- *Group VI.* The adverse effects of ingestion of mushrooms containing psilocin and psilocybine are similar to those described under lysergide (p.2335). Symptoms usually occur within about 30 minutes to 2 hours. Fatalities are rare.
- *Group VII.* Generally no treatment is required for adverse gastrointestinal effects seen with this group of mushrooms.
- *Group VIII.* There may be a delay of as long as 14 to 20 days before symptoms of poisoning due to *Cortinarius* appear. Patients will develop an intense thirst. Other symptoms usually include nausea, vomiting, diarrhoea, and anorexia. Muscle aching and spasms and a feeling of coldness may also occur. In severe cases renal failure may lead to death. It has been reported that up to 15% of patients die.

Pregnancy. α-Amanitine does not appear to cross the placental barrier, even during the acute phase of intoxication.[1]

1. Belliardo F, *et al.* Amatoxins do not cross the placental barrier. *Lancet* 1983; **i:** 1381.

Treatment of Adverse Effects

As there are no specific antidotes for the majority of cases of mushroom poisoning and which species is involved is often unknown, treatment consists primarily of symptomatic and supportive measures. The stomach may be emptied by gastric lavage if the patient has not already vomited spontaneously. However, if presentation is delayed (because of the slow onset of symptoms seen with some types of mushrooms) measures to empty the stomach are unlikely to be productive. Activated charcoal may be of use in binding toxins in the gastrointestinal tract and preventing absorption. Determining the interval between ingestion and the onset of symptoms often helps to identify the type of mushrooms ingested. If possible specimens of the mushrooms or a sample of the stomach contents should be sent to an expert mycologist for identification. Particular attention should be paid to intravenous replacement of fluids and electrolytes especially if vomiting and diarrhoea are severe. If the ingestion of hepatotoxic or nephrotoxic mushrooms is suspected liver and renal function should be monitored.

Since some mushrooms contain a wide range of toxins and patients may have ingested more than one species, specific therapy should only be instituted following positive identification.

- *Group I.* There is little clinical evidence to support the efficacy of specific agents or treatments for the management of cyclopeptide poisoning. Drugs such as benzylpenicillin, silymarin or silibinin have been given to try to protect the liver against the hepatotoxic effects of the amatoxins. Exchange transfusions, haemodialysis, or charcoal haemoperfusion have been tried to facilitate amatoxin removal. The removal of bile via a duodenal tube left *in situ* has been suggested to reduce enterohepatic circulation of amatoxins. Forced diuresis has also been advocated. Liver transplantation may be required for progressive hepatic failure. A radio-immunoassay for the detection of amatoxins is available in some countries to confirm a diagnosis of cyclopeptide poisoning.

- *Group II.* Specific treatment is usually only required if symptoms are severe. Physostigmine has been used to treat antimuscarinic symptoms. As mushrooms containing ibotenic acid and muscimol may also contain small amounts of muscarine, atropine may be required to control muscarinic symptoms.
- *Group III.* Pyridoxine hydrochloride has been given as an intravenous infusion as specific therapy to overcome the inhibition of pyridoxal phosphate by methylhydrazine, but the use of large doses of pyridoxine might itself produce adverse neurological effects. Methylthioninium chloride may be required if methaemoglobinaemia is severe.
- *Group IV.* Atropine sulfate may be required to control the symptoms of muscarine poisoning but it should only be used if definite muscarinic symptoms are present.
- *Group V.* There is no specific treatment for the 'disulfiram-alcohol' reaction except for the maintenance of blood pressure.
- *Group VI.* If symptoms are severe some patients may require sedation with diazepam.

◊ General reviews.

1. Köppel C. Clinical symptomatology and management of mushroom poisoning. *Toxicon* 1993; **31:** 1513–40.

Amanita phalloides. The use of specific antidotes in the treatment of poisoning due to *Amanita phalloides* remains controversial. Acetylcysteine, benzylpenicillin, sulfamethoxazole, thioctic acid, cytochrome C, ascorbic acid, insulin, growth hormone, silymarin or silibinin, and corticosteroids have all been used or suggested. Evidence to support most of these is lacking;[1,2] there is limited evidence to support the use of silibinin and acetylcysteine, but benzylpenicillin, although widely used, does not have proven efficacy.[1] In patients who develop fulminant liver failure the definitive treatment is liver transplantation.[1,2]

Uses

Homoeopathy. Several types of poisonous mushrooms have been used in homoeopathic medicines under the following names:

- *Amanita phalloides*: Agaricus phalloides; Agaricus bulbosus
- *Russula emetica*: Agaricus emeticus: Agar. e.
- *Amanita muscaria*: Agaricus muscarius; Agar. m.
- *Coprinus stercorarius* (*Stropharia stercoraria*): Agaricus stercorarius; Aga. ster.

Musk

Almíscar; Almizcle; Deer Musk; Mosc.; Moschus.

CAS — 541-91-3 (muskone).

Pharmacopoeias. In *Chin.*

Profile

Musk is the dried secretions from the preputial follicles of the musk deer, *Moschus moschiferus* or some other spp. of *Moschus* (Cervidae). It is used as a fragrance and fixative in perfumery. The main source of musk's fragrance is muskone (muscone).

A series of nitrated tertiary butyl toluenes or xylenes, or related compounds, are used as artificial musks. Musk ambrette, a synthetic nitromusk compound used in perfumery and as a food flavour, has been reported to cause contact dermatitis and photosensitivity.

Homoeopathy. Musk has been used in homoeopathic medicines under the following names: Moschus; Mosc.

Black Mustard

Graine de Moutarde Noire; Mostarda Preta; Mostaza negra; Moutarde Jonciforme; Schwarzer Senfsame; Semen Sinapis; Semilla de Mostaza; Sinapis Nigra.

Description. Black mustard is the dried ripe seeds of *Brassica nigra* (*B. sinapioides*) (Cruciferae).

Pharmacopoeias. In *Swiss* which allows *B. nigra*, *B. juncea*, and other species.

White Mustard

Mostaza blanca; Sinapis Alba.

Description. White mustard is the dried ripe seeds of *Brassica alba* (Cruciferae).

Pharmacopoeias. *Chin.* allows *B. alba* or *B. juncea*.

Volatile Mustard Oil

Allylsenföl; Essence of Mustard; Mostaza, aceite esencial de; Oleum Sinapis Volatile.

Allyl Isothiocyanate *(USAN)*

Isothiocyanato-l-propene.

$C_4H_5NS = 99.15$.

CAS — 57-06-7.

Pharmacopoeias. *Fr.* and *US*

USP 31 (Allyl Isothiocyanate). A colourless to pale yellow, very refractive, liquid with a pungent, irritating odour and an acrid taste. Slightly soluble in water; miscible with alcohol, with carbon disulfide, and with ether. Store in airtight containers.

Profile

Black and white mustard seeds have been used as emetics, in counter-irritant and rubefacient preparations, and as condiments. Volatile mustard oil, prepared from black mustard seeds, is largely composed of allyl isothiocyanate. It is an extremely powerful irritant that has been used as a counter-irritant and rubefacient. Expressed mustard oil contains a smaller proportion of volatile oil and has been used as a less powerful counter-irritant.

Adverse effects. A report of 2 cases of IgE-mediated anaphylaxis to mustard condiment.[1]

1. Vidal C, *et al.* Anaphylaxis to mustard. *Postgrad Med J* 1991; **67:** 404.

Handling. Allyl isothiocyanate is a potent lachrymator, with a pungent irritating odour. Care should be taken to protect the eyes, to prevent inhalation of fumes, and to avoid tasting.

Preparations

Proprietary Preparations (details are given in Part 3)
Mon.: Autoplasme Vaillant; Sinapisme Rigollot.

Multi-ingredient: *Braz.:* Aliviol; Analgen†; Benegel; Gelflex; Gelol†; Gelonevral†; Mialgex†; Mostardina†; Nevrol; ***Canad.:*** Rheumalan†; ***Cz.:*** Apisarthron; Rheumosin†; ***Ger.:*** Cor-Select†; ***Pol.:*** Reumobonisol; ***Rus.:*** Apisarthron (Апизартрон); Efcamon (Эфкамон); ***Spain:*** Dolokey; ***Switz.:*** Knobel Huile N; ***UK:*** Nine Rubbing Oils; Radian-B Red Oils; Red Oil; ***USA:*** Dermolin; Methalgen†; Musterole Extra.

Myristyl Alcohol

Alcohol miristilo; Alkohol mirystylowy; NSC-8549; 1-Tetradecanol.

$C_{14}H_{30}O = 214.4$.

CAS — 112-72-1.

Pharmacopoeias. In *USNF.*

USNF 26 (Myristyl Alcohol). M.p. 36° to 42°.

Profile

Myristyl alcohol is used as an oleaginous vehicle. Contact dermatitis has been associated with its use.

Myrrh

Gum Myrrh; Gummiresina Myrrha; Mira; Mirhami; Mirra; Mirrha; Myrhovníková klejopryskyřice; Myrra; Myrrha; Myrrhe.

Мирра

CAS — 9000-45-7 (myrrh); 8016-37-3 (myrrh oil).

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Myrrh). A gum-resin, hardened in air, obtained from the stem and branches of *Commiphora molmol* and/or other species of *Commiphora*. Protect from light.

USP 31 (Myrrh). The oleo-gum resin obtained from the stems and branches of *Commiphora molmol* and other related species of *Commiphora* (Burseraceae) other than *C. mukul*. Store in airtight containers in a dry place.

Profile

The principal source of myrrh is *Commiphora myrrha* (*C. molmol*) (Burseraceae). Myrrh is astringent to mucous membranes; the tincture is used in mouthwashes and gargles for inflammatory disorders of the mouth and pharynx. It has also been used as a carminative. Myrrh has been tried in the treatment of schistosomiasis and fascioliasis.

Myrrh oil is used in aromatherapy.

Contact dermatitis has been reported.

Helminth infections. Myrrh was of benefit in a small study[1] of 7 patients with fascioliasis and in another study[2] of 204 patients with schistosomiasis. However, it showed low cure rates in the treatment of schistosomiasis when compared with praziquantel.[3,4]

Myrtillus

Baccae Myrtilli; Bilberry; Blåbär (bilberry fruit); Blaeberry; Borůvkový plod; Fekete áfonya termés (bilberry fruit); Heidelbeere; Huckleberry; Hurtleberry; Mėlynių uogos, džiovintos (bilberry fruit); Mirtilo; Mustikka (bilberry fruit); Myrtille, fruit de (bilberry fruit); Myrtilli Fructus; Myrtilli fructus (bilberry fruit); Whortleberry.

Pharmacopoeias. In *Eur.* (see p.vii). *US* includes Powdered Bilberry Extract.

Ph. Eur. 6.2 (Bilberry Fruit, Dried; Dried Bilberry BP 2008; Bilberry Fruit, Fresh; Fresh Bilberry BP 2008). The ripe fruit of *Vaccinium myrtillus*. It has a sweet and slightly astringent taste. The dried fruit contains a minimum of 1.0% of tannins, expressed as pyrogallol, calculated with reference to the dried drug. The fresh or frozen fruit contains a minimum of 0.30% of anthocyanins, expressed as cyanidin-3-glucoside chloride (chrysanthemin, $C_{21}H_{21}ClO_{11} = 484.8$), calculated with reference to the dried drug. The frozen fruit should be stored at or below –18°.

Profile

Myrtillus has diuretic and astringent properties. It has been used for ophthalmic and circulatory disorders and for diarrhoea.

Homoeopathy. Myrtillus has been used in homoeopathic medicines under the following names: Vaccinium myrtillus; Vac. myrt.

Preparations

Ph. Eur.: Fresh Bilberry Fruit Dry Extract, Refined and Standardised.

Myrtle

Arrayán; Mirto; Myrte.

CAS — 8008-46-6 (myrtle oil); 8002-55-9 (myrtol).

NOTE. Distinguish from Myrtillus, p.2349, from *Vaccinium myrtillus.*

Profile

Myrtle (*Myrtus communis*, Myrtaceae) has been included in herbal preparations for cough.

Myrtle oil is obtained from the leaves and twigs. Myrtle oil is included in preparations for disorders of the upper respiratory tract and is used in aromatherapy.

The term myrtol has been used to describe an extract of myrtle, standardised on its content of α-pinene, *d*-limonene, and cineole. It is used for respiratory-tract disorders.

Nadide *(BAN, USAN, rINN)*

Codehydrogenase I; Coenzyme I; Co-I; Diphosphopyridine Nucleotide; DPN; NAD; Nadida; Nadidum; Nicotinamide Adenine Dinucleotide; NSC-20272. 1-(3-Carbamoylpyridinio)-β-D-ribofuranoside 5-(adenosine-5′-pyrophosphate).

Надид

$C_{21}H_{27}N_7O_{14}P_2$ = 663.4.

CAS — 53-84-9.

Profile

Nadide is a naturally occurring coenzyme claimed to be of value in the treatment of alcohol and opioid addiction. The reduced form of nadide, NADH, has been used in the management of chronic fatigue syndrome.

Parkinsonism. The reduced form of nadide, NADH (β-NADH; reduced DPN) and its phosphate derivative (NADPH) have been given in the management of Parkinson's disease in an attempt to enhance endogenous dopamine synthesis by stimulating the enzyme tyrosine hydroxylase. Although some beneficial effects have been reported in several case series, a placebo-controlled study failed to find any evidence of efficacy and the routine use of NADH has not been recommended.[1]

Proprietary Preparations (details are given in Part 3)
S.Afr.: DPN; ***Spain:*** Nad.

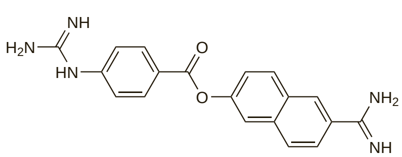
Nafamostat Mesilate *(rINNM)*

FUT-175; Mesilato de nafamostat; Nafamostat, Mésilate de; Nafamostat Mesylate *(USAN)*; Nafamostati Mesilas. 6-Amidino-2-naphthyl *p*-guanidinobenzoate dimethanesulfonate.

Нафамостата Мезилат

$C_{21}H_{25}N_5O_8S_2$ = 539.6.

CAS — 81525-10-2 (nafamostat); 82956-11-4 (nafamostat mesilate).



(nafamostat)

Profile

Like aprotinin (p.1055) nafamostat is a proteolytic enzyme inhibitor. The mesilate is used in the treatment of acute pancreatitis and disseminated intravascular coagulation, and as an anticoagulant in haemodialysis.

Hyperkalaemia has been reported.

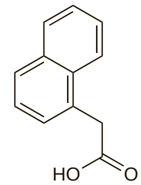
Naphthylacetic Acid

Naftilacético, ácido; 1-Naphthaleneacetic Acid; 1-Naphthylacetic Acid.

$C_{12}H_{10}O_2$ = 186.2.

CAS — 86-87-3.



Profile

Naphthylacetic acid has been used as a choleretic.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Galle-Donau; Spagall; ***Switz.:*** Bilipax†.

Natalizumab *(rINN)*

Natalizumabum. Immunoglobulin G 4 (human-mouse monoclonal AN100226 4-chain antihuman integrin 4), disulfide with human-mouse monoclonal AN100226 light chain, dimer.

Натализумаб

CAS — 189261-10-7.

ATC — L04AA23.

ATC Vet — QL04AA23.

Adverse Effects and Precautions

Natalizumab commonly causes infusion-related reactions including headache, dizziness, fatigue, urticaria, pruritus, rash, fever, rigors, nausea, hypotension, flushing, dyspnoea, and chest pain. Serious hypersensitivity reactions such as anaphylaxis can also occur. These reactions are usually associated with antibodies to natalizumab. The presence of these antibodies results in reduced serum concentrations and efficacy of natalizumab. The risk of infection is increased and there have been a few cases of progressive multifocal leukoencephalopathy (PML) reported; all patients should be monitored and if signs or symptoms of PML appear treatment should be withheld pending investigation. Clinically significant hepatotoxicity has also been reported with natalizumab and treatment should be stopped if there is evidence of jaundice or other significant liver injury.

Natalizumab is contra-indicated in patients who have previously had PML. It is also contra-indicated in patients with, or at risk for, opportunistic infections, and in those with malignancies.

Antibody formation. The incidence and clinical effects of antibody formation to natalizumab therapy in patients with relapsing multiple sclerosis were studied in the AFFIRM and SENTINEL studies.[1] Of 625 patients treated with natalizumab in the AFFIRM study 20 (3%) were transiently positive for antibodies to natalizumab and 37 (6%) were persistently positive. Equivalent figures for 585 natalizumab-treated patients in the SENTINEL study were 32 (5%) and 38 (6%) respectively. Overall the presence of antibodies was generally correlated with reduced serum concentrations of natalizumab and a poorer treatment response, efficacy being restored in those patients who became antibody-negative during therapy. Antibody-positive patients also had a higher incidence of infusion-related adverse effects, including hypersensitivity reactions (17 of the 37 persistently positive patients in the AFFIRM study). It is recommended that patients with suboptimal response to natalizumab or persistent infusion-related adverse effects should be considered for antibody testing. UK licensed product information warns that therapy should not be restarted in patients who remain positive for antibodies 6 weeks after interrupting an initial short exposure to natalizumab.

1. Calabresi PA, *et al.* The incidence and significance of anti-natalizumab antibodies: results from AFFIRM and SENTINEL. *Neurology* 2007; **69:** 1391–1403.

Hypersensitivity. A review[1] of the data for patients who had hypersensitivity reactions in the AFFIRM study[2], which included 627 patients in the natalizumab treatment group, found that there was a low incidence (<1%) of serious reactions described as anaphylactoid or anaphylactic. All patients with hypersensitivity reactions responded promptly to discontinuation of the infusion and standard pharmacotherapy as necessary (adrenaline, oxygen, and antihistamines with or without corticosteroids); all recovered fully about 1 to 2 hours after the end of the infusion. UK licensed product information warns that patients should be counselled on the importance of uninterrupted dosing, particularly in the early months of treatment; the risk for hypersensitivity reactions is greatest with early infusions and in patients who, after an initial short exposure to natalizumab, are re-exposed after a treatment-free period of 3 or more months.

1. Phillips JT, *et al.* Infusion-related hypersensitivity reactions during natalizumab treatment. *Neurology* 2006; **67:** 1717–18. Correction. *ibid.* 2007; **68:** 473.
2. Polman CH, *et al.* AFFIRM investigators. A randomized, placebo-controlled trial of natalizumab for relapsing multiple sclerosis. *N Engl J Med* 2006; **354:** 899–910.

Infections. Three cases of progressive multifocal leukoencephalopathy (an opportunistic infection of the brain caused by JC virus, a human polyomavirus) have been described in patients given natalizumab.[1-3] One patient[1] died after receiving natalizumab with azathioprine for Crohn's disease. The other patients[2,3] were given natalizumab with interferon beta for multiple sclerosis; one of these[2] also died. After these reports, the use of natalizumab has been restricted (see Uses and Administration, below). A subsequent retrospective evaluation[4] of more than 3000 patients who had received natalizumab found no further cases. However, 2 further cases have subsequently been reported[5] in patients taking natalizumab as monotherapy for 14 months and 17 months; one of the patients had previously taken immunosuppressants.

Melanoma. Long-standing naevi in two women developed into melanoma shortly after starting natalizumab treatment for multiple sclerosis.[1]

1. Mullen JT, *et al.* Melanoma complicating treatment with natalizumab for multiple sclerosis. *N Engl J Med* 2008; **358:** 647–8.

Interactions

Use with antineoplastics, immunosuppressants, or immunomodulators may further increase the risk of opportunistic infections including progressive multifocal leukoencephalopathy associated with natalizumab. Concurrent treatment with interferon beta or glatiramer acetate is contra-indicated.

Uses and Administration

Natalizumab is a murine monoclonal antibody raised against human α4 integrin that is used as monotherapy to prevent relapses and delay progression of disability in patients with highly active relapsing-remitting multiple sclerosis. It is also used for inducing and maintaining response and remission in moderate to severe Crohn's disease (see Inflammatory Bowel Disease, p.1697). However, because of an increased risk of progressive multifocal leukoencephalopathy (PML) its availability is restricted, and use is limited to patients who have had an inadequate response to, or are unable to tolerate, other therapies. A baseline magnetic resonance imaging scan must be done before natalizumab is started in order to differentiate newly developed lesions from pre-existing lesions. Patients should be evaluated for signs and symptoms of PML at 3 and 6 months after the first dose, then every 6 months thereafter. Natalizumab must be discontinued at the first sign of PML or other opportunistic infection developing; treatment may resume if this diagnosis is excluded, but should be permanently discontinued if confirmed.

Patients who were previously taking interferon beta or glatiramer acetate may switch directly to natalizumab provided there are no treatment-related adverse effects such as neutropenia; blood counts must return to normal before starting natalizumab. Patients who have been receiving immunosuppressants such as azathioprine and cyclophosphamide must not start natalizumab until it has been confirmed that they are no longer immunocompromised. Likewise, the pharmacodynamic effects of natalizumab remain for about 12 weeks after stopping treatment, and therefore a wash-out period may be appropriate on stopping natalizumab before giving immunosuppressive drugs.

Natalizumab 300 mg is given by intravenous infusion once every 4 weeks. The dose is diluted in 100 mL of sodium chloride 0.9% and given over about 1 hour. The patient should be observed during the infusion and for a further hour after it is complete; the infusion should be stopped if a hypersensitivity reaction occurs and treatment with natalizumab permanently discontinued. Treatment should also be discontinued if there is evidence of persistent raised antibodies to natalizumab since these reduce efficacy and increase the risk of hypersensitivity reactions. Continuation of therapy in multiple sclerosis patients who have shown no benefit after 6 months should be reconsidered. In the treatment of Crohn's disease, natalizumab should be stopped if patients have not obtained therapeutic benefit after 12 weeks of induction therapy or when patients are unable to discontinue chronic concomitant corticosteroid use within 6 months of starting natalizumab.

Natalizumab has also been investigated for the treatment of ulcerative colitis.

Inflammatory bowel disease. The efficacy and safety of natalizumab in the treatment of *Crohn's disease* have been reviewed, including proposed mechanisms for the role of α4 integrins in the immunopathogenesis of inflammatory bowel disease (p.1697).[1,2] A systematic review[3] of controlled studies of the use of natalizumab in the treatment of Crohn's disease concluded that it is effective for induction of clinical response and remission in some patients with moderately to severely active Crohn's disease, particularly those with active inflammation or chronically active disease despite use of conventional treatment. However, this benefit must be weighed against the risks of developing progressive multifocal leukoencephalopathy.

Natalizumab is also under investigation for *ulcerative colitis*.[4]

Multiple sclerosis. The efficacy and safety of natalizumab in the treatment of multiple sclerosis (p.892) have been reviewed, including proposed mechanisms for the role of α4 integrins in its immunopathogenesis.[1-3] Randomised controlled studies[4-7] showed beneficial results in suppressing inflammatory lesions and reducing the frequency of relapse. Subsequent review[8] of the data from the AFFIRM trial[5] and the SENTINEL study[6] demonstrated reduction of visual loss. In the SENTINEL study,[6] natalizumab was given with interferon beta, a combination that may have contributed to the development of progressive multifocal leukoencephalopathy in 2 of the study patients, one of whom died (see Infections, above). As a consequence, natalizumab is currently licensed only as monotherapy.

Neroli Oil

Aurantii amari floris aetheroleum; Aurantii Amari Floris Aetheroleum (bitter-orange flower oil); Aurantii Amari Floris Etheroleum; Azahar, aceite esencial de; Bitter-Orange Flower Oil; Esencia de Azahar; Essência de Flor de Laranjeira; Karčiavaisių citrinmedžių žiedų eterinis aliejus (bitter-orange flower oil); Keserű narancs virág olaj (bitter-orange flower oil); Neroli aetheroleum; Néroli, huile essentielle de; Neroliolja; Nerolióljy; Olejek z kwiatu pomarańczy gorzkiej; Oleum Neroli; Orange Flower Oil; Orange-flower Oil; Silice květů hořkého pomeranče.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Neroli Oil). A clear, pale yellow or dark yellow liquid with a characteristic odour obtained by steam distillation from the fresh flowers of *Citrus aurantium* subsp. *aurantium* (*C. aurantium* subsp. *amara*). Relative density 0.863 to 0.880. Store in well-filled airtight containers at a temperature below 25°. Protect from light.

Profile

Neroli oil is used as a flavour and in perfumery. It is also used in aromatherapy. Photosensitivity reactions have been reported.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Chile:*** Agua Melisa Carminativa; ***Cz.:*** Stopangin; ***Ital.:*** Controller; ***Rus.:*** Stopangin (Стопангин); ***Switz.:*** Hygiodermil; Kemeol; Oculosan.

Nerve Agents

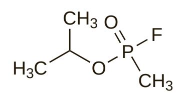
Gases nerviosos.

Sarin

GB; Sarín. Isopropyl methylphosphonofluoridate.

$C_4H_{10}FO_2P$ = 140.1.

CAS — 107-44-8.

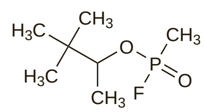


Soman

GD; Somán. Pinacolyl methylphosphonofluoridate.

$C_7H_{16}FO_2P$ = 182.2.

CAS — 96-64-0.



Tabun

GA; Tabún. Ethyl *N*-dimethylphosphoramidocyanidate.

$C_5H_{11}N_2O_2P$ = 162.1.

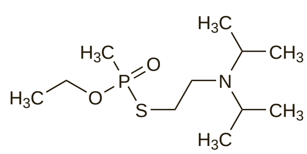
CAS — 77-81-6.

VX

Methylphosphonothioic acid S-{2-[bis(1-methylethyl)amino]ethyl} *O*-ethyl ester.

$C_{11}H_{26}NO_2PS$ = 267.4.

CAS — 50782-69-9.



Profile

The nerve agents, sarin, soman, tabun, and VX (also referred to as 'nerve gases') used in chemical warfare are extremely potent inhibitors of cholinesterase. The effects of poisoning due to these agents, and their treatment, are similar to those for organophosphorus insecticides (p.2047) but as the nerve agents have a much greater intrinsic toxicity the symptoms of poisoning are more severe. Pyridostigmine has been given prophylactically to personnel at risk from exposure to nerve agents (see p.634).

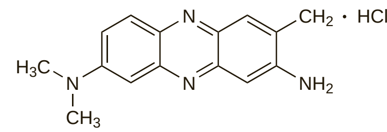
Neutral Red

CI Basic Red 5; Colour Index No. 50040; Neutral Red Chloride; Nuclear Fast Red; Rojo neutro; Toluylene Red. 3-Amino-7-dimethylamino-2-methylphenazine hydrochloride.

$C_{15}H_{16}N_4,HCl$ = 288.8.

CAS — 553-24-2.



Profile

Neutral red is used as an indicator for alkalinity and for preparing neutral-red paper. It is also used as a stain in microscopy.

It is a photoactive dye that has been tried in photodynamic therapy of recurrent herpes simplex infections, but with limited success.

Niaouli Oil

Essence de Niaouli; Gomenol.

Pharmacopoeias. In *It.*

Profile

Niaouli oil is a volatile oil, obtained by distillation from the fresh leaves of *Melaleuca viridiflora* or *Melaleuca quinquenervia* (Myrtaceae). It contains cineole and has similar actions to eucalyptus oil (p.2301). It is an ingredient of many preparations. Typical indications include respiratory tract congestion. Cajuput oil (p.2271) and melaleuca oil (p.2338) are also prepared from *Melaleuca* spp.

Preparations

Proprietary Preparations (details are given in Part 3)

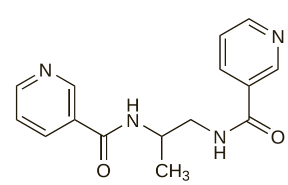
Nicaraven *(rINN)*

Nicaravén; Nicaravenum. (±)-*N*,*N*′-Propylenebis[nicotinamide].

Никаравен

$C_{15}H_{16}N_4O_2$ = 284.3.

CAS — 79455-30-4.



Profile

Nicaraven is under investigation as a cerebral vasodilator.

◊ References.

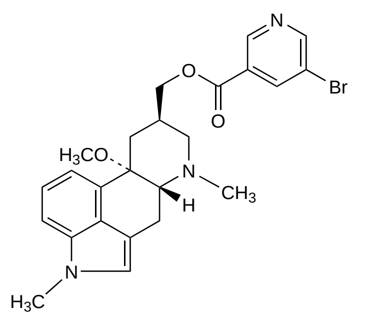
1. Jain KK. Nicaraven for the treatment of cerebral vasospasm in subarachnoid haemorrhage. *Expert Opin Invest Drugs* 2000; **9:** 859–70.

Nicergoline *(BAN, USAN, rINN)*

FI-6714; Nicergolin; Nicergolina; Nicergolinas; Nicergolinum; Nisergoliini; Nisergolin. 10α-Methoxy-1,6-dimethylergolin-8β-ylmethyl 5-bromonicotinate.

Ницерголин

$C_{24}H_{26}BrN_3O_3$ = 484.4.
CAS — 27848-84-6.
ATC — C04AE02.
ATC Vet — QC04AE02.



Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.*

Ph. Eur. 6.2 (Nicergoline). A fine to granular white or yellowish powder. It exhibits polymorphism. Practically insoluble in water; soluble in alcohol; freely soluble in dichloromethane.

Adverse Effects and Precautions

Adverse effects that may occur after nicergoline include gastrointestinal disturbances and, particularly after parenteral doses, hypotension.

Incidence of adverse effects. Adverse effects occurred in 25 of 359 patients with cerebrovascular insufficiency treated with nicergoline for 1 month;[1] the drug had to be withdrawn in 11. The reactions included 6 cases of hot flushes, 8 of general malaise, 2 of agitation, 3 of hyperacidity, 1 of nausea, 3 of diarrhoea, and 2 of dizziness and somnolence.

1. Dauverchain J. Bedeutung von Nicergolin bei der symptomatischen Behandlung des arteriellen Hochdrucks und der chronischen, zerebro-vaskulären Insuffizienz. *Arzneimittelforschung* 1979; **29:** 1308–10.

Porphyria. Nicergoline is considered to be unsafe in patients with porphyria because it has been shown to be porphyrinogenic in *in-vitro* systems, although there is conflicting evidence of porphyrinogenicity.

Interactions

For a study indicating that nicergoline enhances the cardiac depressant action of propranolol, see Ergot Derivatives, in Interactions of Beta Blockers, p.1229.

Uses and Administration

Nicergoline is an ergot derivative. It has been used similarly to codergocrine mesilate (p.364) to treat symptoms of mental deterioration associated with cerebrovascular insufficiency (see Dementia, p.362) and has also been used in peripheral vascular disease (p.1178). Nicergoline has been given in doses of up to 60 mg daily by mouth in divided doses, and by intramuscular injection in doses of 2 to 4 mg twice daily; 4 to 8 mg daily has been given by intravenous infusion. Nicergoline tartrate has been used in parenteral dosage forms.

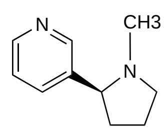
Nicotine

Nicotina; Nicotinum; Nikotiini; Nikotin; Nikotinas. (*S*)-3-(1-Methylpyrrolidin-2-yl)pyridine.

$C_{10}H_{14}N_2$ = 162.2.
CAS — 54-11-5.
ATC — N07BA01.
ATC Vet — QN07BA01; QP53AX13.



Description. Nicotine is a liquid alkaloid obtained from the dried leaves of the tobacco plant, *Nicotiana tabacum* and related species (Solanaceae). Tobacco leaves contain 0.5 to 8% of nicotine combined as malate or citrate.

Pharmacopoeias. In *Eur.* (see p.vii) and *US.*

Ph. Eur. 6.2 (Nicotine). A colourless or brownish, volatile, hygroscopic, viscous liquid. Soluble in water; miscible with dehydrated alcohol. Store under nitrogen in airtight containers. Protect from light.

USP 31 (Nicotine). It should be stored under nitrogen at a temperature below 25°. Protect from light and moisture.

Nicotine Polacrilex *(USAN)*

CAS — 96055-45-7.
ATC — N07BA01.
ATC Vet — QN07BA01.

Pharmacopoeias. In *US.*

USP 31 (Nicotine Polacrilex). A weak carboxylic cation-exchange resin prepared from methacrylic acid and divinylbenzene, in complex with nicotine. Store in airtight containers.

Nicotine Resinate

Nicotine, résinate de; Nicotini resinas; Nicotinresinat; Nikotiiniresinaatti; Nikotino rezinatas; Nikotin-resinát; Nikotin-rezinát.

ATC — N07BA01.
ATC Vet — QN07BA01.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Nicotine Resinate). A complex of nicotine with a weak cationic exchange resin. It may contain glycerol. A white or slightly yellowish powder. Practically insoluble in water. Store in airtight containers. Protect from light.

Nicotine Tartrate

Nicotine Bitartrate *(USAN).*

$C_{10}H_{14}N_2,2C_4H_6O_6,2H_2O$ = 498.4.
CAS — 65-31-6 (anhydrous nicotine tartrate).
ATC — N07BA01.
ATC Vet — QN07BA01.

Dependence and Withdrawal

Nicotine dependence is most commonly associated with cigarette smoking. It is characterised by a strong desire to continue taking the agent, a physical and psychological need for it, and a characteristic abstinence syndrome on withdrawal. Common symptoms seen on nicotine withdrawal include irritability, anxiety, depression, restlessness, poor concentration, increased appetite, weight gain, and insomnia. The management of smoking cessation is discussed under Uses and Administration, below.

Mild withdrawal symptoms have been reported from nicotine replacement preparations used to aid smoking cessation.

Adverse Effects and Treatment

Nicotine is a highly toxic substance and in acute poisoning death may occur within 1 hour due to respiratory failure arising from paralysis of the muscles of respiration. The fatal oral dose of nicotine for an adult is from 40 to 60 mg.

Less severe poisoning causes initial stimulation followed by depression of the autonomic nervous system. Typical symptoms include burning of the mouth and throat, nausea and salivation, abdominal pain, vomiting, diarrhoea, dizziness, weakness, hypertension followed by hypotension, mental confusion, headache, hearing and visual disturbances, dyspnoea, faintness, convulsions, sweating, and prostration. Transient cardiac standstill or paroxysmal atrial fibrillation may occur.

Nicotine is rapidly absorbed through the skin or by inhalation as well as by ingestion, and nicotine poisoning may occur due to careless handling when it is used as a horticultural insecticide.

Prompt treatment of nicotine poisoning is essential. If contact was with the skin, contaminated clothing should be removed and the skin washed thoroughly with cold water without rubbing. If the patient has swallowed nicotine, gastric lavage and activated charcoal may be beneficial. Treatment is supportive and includes support of respiration and control of convulsions. Atropine may be used to suppress features of parasympathomimetic stimulation.

Apart from effects such as dizziness, headache, and gastrointestinal disturbances mentioned above, adverse effects associated with *nicotine replacement preparations* have also included cold and flu-like symptoms, palpitations, insomnia, vivid dreams, myalgia, chest pain, blood pressure changes, anxiety, irritability, somnolence, and dysmenorrhoea. Allergic reactions have been reported. Adverse effects associated with specific preparations include skin reactions with transdermal patches; nasal irritation, epistaxis, lachrymation, and sensations in the ear with the nasal spray; throat irritation with the spray, inhalator, sublingual tablets, lozenges, or chewing gum; aphthous ulceration with the inhalator, sublingual tablets, lozenges, or chewing gum; increased salivation and sometimes swelling of the tongue with chewing gum; cough, rhinitis, stomatitis, sinusitis, and dry mouth with the inhalator; and unpleasant taste with the sublingual tablets or lozenges. Excessive swallowing of nicotine released from oral replacement preparations may cause hiccups in the first few days of treatment.

Adverse effects of tobacco products. Chronic use of tobacco is linked to a variety of diseases. By the mid-1960s, epidemiological data established tobacco smoking as a cause of lung cancer (p.668). Smoking is also associated with cancers of the larynx, mouth, cervix, bladder, pancreas, oesophagus, stomach, and kidneys, and with leukaemia.[1] Smoking is a risk factor in cardiovascular, respiratory, and peripheral and cerebral vascular diseases.[1-3] Smoking also increases the risk of developing peptic ulcer disease and may affect other gastrointestinal disorders.[2] There is also evidence that smoking tobacco products increases the risk of developing age-related macular degeneration,[4] type 2 diabetes mellitus,[5] and adenomatous polyps.[6]

Maternal smoking in pregnancy is associated with low birth-weight infants and increased risk of abortion, still-birth, and neonatal death (see also Pregnancy under Precautions, below).

Passive smoking refers to inhalation of secondhand tobacco smoke or environmental tobacco smoke. Risks to health from passive exposure are lower than those from active smoking. However, studies have established passive smoking as a cause of lung cancer;[7] passive smoking is also associated with increased risk of heart disease[8] and chronic respiratory disease.[9,10] Smokeless tobacco products also carry risks to health, for example the association of cancers of the head and neck (see p.666) with the use of mixtures of tobacco and areca (p.2259) and probably snuff or chewing tobacco.[11,12]

12. Critchley JA, Unal B. Health effects associated with smokeless tobacco: a systematic review. *Thorax* 2003; **58:** 435–43.

Effects on carbohydrate metabolism. Hyperinsulinaemia and insulin resistance have been associated with long-term use of nicotine gum.[1] Smoking tobacco products may increase the risk of developing type 2 diabetes mellitus (see above).

1. Eliasson B, *et al.* Long-term use of nicotine gum is associated with hyperinsulinemia and insulin resistance. *Circulation* 1996; **94:** 878–81.

Effects on the cardiovascular system. As mentioned above, nicotine from tobacco products is associated with increased risk of cardiovascular disease. It would not be surprising, therefore, if nicotine replacement preparations were also associated with cardiovascular adverse effects, and there are anecdotal reports of cardiovascular events, including myocardial infarction,[1,2] stroke,[3,4] and cerebral haematoma,[5] associated with use of such products. However, a case-control study in the general population,[6] and both cohort studies[7] and short-term placebo-controlled trials[8,9] in patients with cardiovascular disease have failed to show any increased cardiovascular risk associated with transdermal nicotine.

Vasculitis. Vasculitis occurring in 2 patients was associated with transdermal nicotine patches.[1]

1. van der Klauw MM, *et al.* Vasculitis attributed to the nicotine patch (Nicotinell). *Br J Dermatol* 1996; **134:** 361–4.

Precautions

Nicotine preparations should not be used in patients who have experienced recent cerebrovascular accident. They should be used with caution in patients with cardiovascular disease. Use should preferably be avoided completely in severe cardiovascular disease, including during the immediate postmyocardial infarction period, and in patients with severe arrhythmias or unstable angina pectoris, although use under medical supervision may be considered if the patient is otherwise unable to stop smoking. They should be used with caution in those with peripheral vascular disease, in endocrine disorders including phaeochromocytoma, hyperthyroidism, and diabetes mellitus, in peptic ulcer disease, or renal or hepatic impairment. They should also be used with caution, and avoided if possible, during pregnancy or breast feeding (see below).

Skin patches should not be used on broken skin.

Breast feeding. The American Academy of Pediatrics[1] notes that there have been reports of decreased milk production in breast-feeding mothers who smoke, and of decreased weight gain in the infant. There is, however, controversy regarding the effects of nicotine on infant size at 1 year of age. Although nicotine and its metabolite cotinine have been shown to be distributed into breast milk there are hundreds of compounds in tobacco smoke; nicotine is not necessarily the only component that might be detrimental to the breast-fed infant. Nicotine is present in breast milk in concentrations between 1.5 to 3 times the maternal plasma concentration, but there is no evidence documenting whether this amount of nicotine presents a health risk to the infant. Indeed, one study reported that the incidence of acute respiratory illness in infants whose mothers smoked was decreased in those who were breast fed when compared with those infants who were bottle fed.

1. American Academy of Pediatrics. The transfer of drugs and other chemicals into human milk. *Pediatrics* 2001; **108:** 776–89. Correction. *ibid.*; 1029. Also available at: http://aappolicy.aappublications.org/cgi/content/full/pediatrics%3b108/3/776 (accessed 02/07/04)

Exercise. Physical exercise increased mean peak plasma concentrations of nicotine in 8 healthy subjects treated with a transdermal nicotine patch.[1] The effect was thought to be most likely due to increased skin perfusion resulting in increased uptake.

1. Klemsdal TO, *et al.* Physical exercise increases plasma concentrations of nicotine during treatment with a nicotine patch. *Br J Clin Pharmacol* 1995; **39:** 677–9.

Myasthenia gravis. A patient with myasthenia gravis noted worsening of his symptoms after application of transdermal nicotine patches, the effects being most severe about 1 hour after application, and resolving within 3 hours once the patch was removed.[1] Previous heavy smoking had not produced similar adverse effects, despite the fact that blood-nicotine concentrations are typically higher just after finishing a cigarette than when using the patch.[2]

1. Moreau T, *et al.* Nicotine-sensitive myasthenia gravis. *Lancet* 1994; **344:** 548–9.
2. Pethica D. Nicotine-sensitive myasthenia gravis. *Lancet* 1994; **344:** 961.

Pregnancy. Cigarette smoking during pregnancy is associated with an increased risk of low birth-weight, spontaneous abortion, and perinatal mortality.[1] There is also some evidence of a possible association between smoking during pregnancy and the sudden infant death syndrome (SIDS).[2] In addition to nicotine, cigarette smoke contains many other chemicals, which are also fetal toxins, including carbon monoxide and lead.[3] Although smoking poses a far greater risk than pure nicotine, nicotine replacement therapy (NRT) is not without potential risks and should be reserved for mothers unable to quit with behavioural therapy alone.[3] It has been suggested that where NRT is required, the intermittent delivery formulations such as nicotine gum or inhalator, which expose the fetus to a lower total dose of nicotine, are preferable to continuous use formulations such as patches.[3]

Interactions

Tobacco smoking induces hepatic metabolic enzymes and the pharmacokinetics of many drugs are altered. Drugs such as methoxsalen which inhibit the cytochrome P450 isoenzyme CYP2A6 may decrease the metabolism of nicotine, resulting in increased plasma concentrations.

Nicotinic acid. As described on p.1958, a possible interaction between nicotinic acid and nicotine from a transdermal patch has been reported.

Pharmacokinetics

Nicotine is readily absorbed through mucous membranes and the skin; bioavailability of oral nicotine is low due to extensive first-pass metabolism. Nicotine is widely distributed; it crosses the blood-brain barrier and the placenta and is found in breast milk. The elimination half-life is about 1 to 2 hours. Nicotine is metabolised mainly in the liver via the cytochrome P450 isoenzyme CYP2A6 to cotinine and nicotine-*N*-oxide. Nicotine and its metabolites are excreted in the urine.

Uses and Administration

The main physiological action of nicotine is paralysis of all autonomic ganglia, preceded by stimulation. Centrally, small doses cause respiratory stimulation, while larger doses produce convulsions and arrest of respiration. The effects on skeletal muscle are similar to those on ganglia.

Nicotine chewing gum, transdermal patches, lozenges, sublingual tablets, nasal spray, or inhalator are used as aids for smoking cessation (below) and many such products are also used to reduce the amount smoked. For smoking *cessation*, treatment is usually continued for up to 3 months, then gradually withdrawn. For smoking *reduction*, it may be continued for up to 6 months, and an attempt to quit then made. If use is to be continued beyond 9 months, additional advice from a healthcare professional should be sought.

- *Chewing gum* is available in strengths of 2 mg and 4 mg; the nicotine may be present in the gum in the form of a complex with methacrylic acid polymer (nicotine polacrilex). Individuals who smoke 20 cigarettes or less per day should start with the 2-mg strength gum chewed slowly over about 30 minutes when the urge to smoke occurs. Those who smoke over 20 cigarettes a day or require more than 15 pieces daily of the 2-mg gum should receive the 4-mg strength. Not more than 15 pieces should be used per day.
- *Sublingual tablets* containing the equivalent of 2 mg of nicotine as a β-cyclodextrin complex may be used: the recommended dose is 1 or 2 tablets sublingually every hour, increased to a maximum of 40 tablets daily if necessary.
- *Lozenges* containing 1 or 2 mg of nicotine (as the polacrilex or as the tartrate) are available. The initial dose is 1 lozenge every 1 to 2 hours increased to a maximum daily dose of 30 of the 1-mg lozenges or 15 of the 2-mg lozenges.
- Adhesive *transdermal patches* are designed to be worn for 16 or 24 hours and are available in different strengths that deliver from 5 to 21 mg during the recommended wearing time. One patch should be applied daily, on waking, to a dry, non-hairy area of skin on the hip, trunk, or upper arm, usually beginning with the highest strength or with a dose determined by the previous daily consumption of cigarettes. A different site of application should be used each day with several days elapsing before the patch is applied to the same area of skin.
- A suggested initial dosage for a *nasal spray* containing 500 micrograms per spray is one spray administered into each nostril up to twice hourly as required up to a maximum of 80 sprays daily for the first 8 weeks and reduced gradually thereafter. Treatment for more than 3 months is not recommended.
- Nicotine *inhalator cartridges* contain nicotine 10 mg for use in an appropriate inhaler mouthpiece. The initial dose is 6 to 16 cartridges daily for up to 12 weeks and is reduced gradually over a further 4 to 12 weeks.

Nicotine has been used as a horticultural insecticide.

Alzheimer's disease. The use of nicotine as a cholinergic agonist is one of a number of methods being studied[1] to overcome brain cholinergic deficits in patients with Alzheimer's disease (see Dementia, p.362). Preliminary studies[2,3] using nicotine patches have been of limited duration and were inconclusive. Transdermal nicotine has been used for the control of behavioural symptoms such as agitation in a small number of patients with Alzheimer's disease.[4] A systematic review[5] was unable to present any conclusions on the efficacy and safety of nicotine in Alzheimer's disease because of a lack of adequate randomised controlled studies.

Blepharospasm. Nicotine nasal spray was reported to be of benefit in a patient with blepharospasm (p.1891) refractory to botulinum A toxin.[1] However, a subsequent study in 4 patients with blepharospasm reported no improvement with the use of nicotine nasal spray.[2]

1. Dursun SM, *et al.* Treatment of blepharospasm with nicotine nasal spray. *Lancet* 1996; **348:** 60.
2. Dressler D, *et al.* Nicotine nasal spray is not reliable treatment for blepharospasm: results of a pilot study. *Mov Disord* 1998; **13:** 190.

Extrapyramidal disorders. Nicotine transdermal patches have been reported to produce beneficial effects[1] in schizophrenic patients with antipsychotic-induced akathisia (p.971). Because of an apparent inverse association between smoking and Parkinson's disease (p.791), transdermal nicotine patches have been investigated in the treatment of parkinsonian symptoms, but with little evidence of overall benefit.[2,3]

Smoking cessation. Smoking is the single most important cause of preventable illness and premature death in the UK and USA; it is estimated that around 1 in 5 deaths are due to smoking-related illnesses. The financial burden of smoking-related diseases on healthcare providers is also substantial. Many governments have undertaken initiatives to promote smoking cessation for which there is substantial evidence of a decline in the risk of disease[1] and death.[2] As the abstinence period increases, the reduced risk of disease in former smokers may even approach, although rarely does it ever equal, that of people who have never smoked.[1].

Nicotine dependence and the development of a characteristic withdrawal syndrome (see Dependence and Withdrawal, above) make stopping smoking very difficult. Many individuals relapse when trying to give up or need several attempts before successfully stopping. Both nonpharmacological and pharmacological treatments can improve the abstinence rate and are most effective when the two approaches are combined.[3-12]

Nonpharmacological methods include counselling, training in coping skills, and support groups; although the abstinence rate increases with the intensity of the support, even brief advice is effective in encouraging cessation.

The first-line pharmacological intervention is *nicotine replacement therapy* (NRT) which is an effective treatment for reducing the cravings associated with stopping smoking. NRT is available in numerous formulations: chewing gum, transdermal patches, inhalators, nasal sprays, sublingual tablets, and lozenges. A systematic review[10] of NRT found abstinence was more than doubled when compared with controls, regardless of the intensity of any additional nonpharmacological support.

Choice of formulation is based on patient preference, tolerance, and previous treatments, if any. The transdermal patch is easiest to use and compliance is greatest with this route but local effects may be troublesome. The gum has an unpleasant taste initially and some find the chewing action difficult. The sublingual tablet may be useful for those who have difficulty chewing the gum. The nasal spray has a fast onset of action but may cause local irritation. The inhalator has the advantage of simulating cigarette smoking but may cause local irritation of the mouth and throat. The lozenge has the advantage that it can be sucked discreetly. Patients who are unable to tolerate one type of NRT may benefit from a course of an alternative NRT preparation.

Combination therapy with different types of NRT (patches with either the nasal spray, inhalator, or chewing gum) has also been tried as a means of increasing efficacy.

NRT for smoking cessation is usually continued for about 3 months before being withdrawn. Although the manufacturers advise gradual withdrawal, others[6,8] have found that this offers no advantage and recommend abrupt withdrawal. NRT for smoking reduction is typically continued for longer periods. NRT has also been used long-term and may be of particular benefit in those patients who feel they would relapse if NRT was stopped or in those who have persistent withdrawal symptoms.

There has been concern over the use of NRT in patients with cardiovascular disease (see Effects on the Cardiovascular System, above) but clinical experience and studies have shown that NRT can be used with caution in these patients. The use of NRT in those who have suffered a recent myocardial infarction or those with severe arrhythmias or unstable angina is, however, contra-indicated as such patients have not been adequately studied.

A number of other drugs have also been used to achieve abstinence from smoking.[13-15] *Bupropion* is effective and recommended by some as a first-line alternative to NRT; its action is said to be independent of its antidepressant activity. Bupropion in combination with NRT has been used successfully. Evidence to support the use of most other antidepressants is lacking,[16] but *nortriptyline* appears to be effective and is used as a second-line drug. A study[17] found, however, that there was no advantage in combining nortriptyline with NRT. *Clonidine* is also effective but adverse effects limit its usefulness.[15] Preliminary investigations suggest that *selegiline* and *mecamylamine* may be effective.[13,15] The cannabinoid-1 receptor antagonist *rimonabant* has produced promising results in early studies,[13,14] although a systematic review[18] of 3 randomised controlled studies found the evidence to be inconclusive. A systematic review[19] of studies on the use of the oral nicotine receptor partial agonists *varenicline* and *cytisine* concluded that both drugs have a potential place in smoking cessation. Varenicline compared favourably with placebo and bupropion in helping smokers to quit, but its efficacy in preventing relapse still remains to be fully established. Like bupropion, varenicline is recommended by some as a first-line alternative to NRT. Cytisine is widely used in central and eastern Europe but the current evidence for efficacy is limited and better designed studies are required to test earlier findings. There is little or no evidence to support the efficacy of other treatments such as *silver acetate*, *lobeline*, or *anxiolytics* such as *buspirone*, and their use is not recommended. A *vaccine* for the prevention of smoking relapse is under investigation.[13,14]

Spasticity. There have been anecdotal reports[1] of beneficial responses to nicotine in spastic dystonia.

1. Vaughan CJ, *et al.* Treatment of spastic dystonia with transdermal nicotine. *Lancet* 1997; **350:** 565.

Tics. Tourette's syndrome (see Tics, p.954) is characterised by motor and vocal tics and behavioural disturbances. Nicotine[1-5] has been reported to be of benefit when used alone or with the more usual treatment of haloperidol in patients with Tourette's syndrome whose symptoms were not satisfactorily controlled with haloperidol alone. It is hoped that the use of transdermal nicotine patches will avoid the reported problems of compliance associated with the taste and gastrointestinal effects of nicotine gum.

Ulcerative colitis. Investigation of the use of nicotine in ulcerative colitis (see Inflammatory Bowel Disease, p.1697) has been prompted by the observation that this condition is rare in smokers.[1] A systematic review[2] found that transdermal nicotine was more effective than placebo in producing remission in patients with active ulcerative colitis, but appeared to be no more effective than standard therapy with a corticosteroid or aminosalicylate, and was associated with more adverse effects. It appears to be ineffective in maintaining disease remission.[3] Any role is likely to be limited to patients who do not respond to standard therapy and who can tolerate the adverse effects.[2] Local delivery to the colon, in the form of enemas[4-6] and oral modified-release capsules,[7] is under investigation as a means of reducing the adverse effects of nicotine.

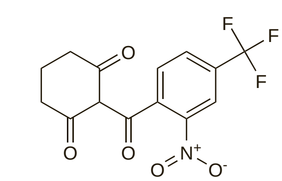
Nitisinone *(USAN, rINN)*

Nitisinonum; NTBC; SC-0735. 2-(α,α,α-Trifluoro-2-nitro-*p*-toluoyl)-1,3-cyclohexanedione.

Нитизинон

$C_{14}H_{10}F_3NO_5$ = 329.2.
CAS — 104206-65-7.
ATC — A16AX04.
ATC Vet — QA16AX04.



Profile

Nitisinone is a 4-hydroxyphenylpyruvate dioxygenase inhibitor used in the management of hereditary tyrosinaemia type 1; dietary restriction of tyrosine and phenylalanine is also necessary. An initial daily dose of 1 mg/kg given orally is recommended; daily dosage should be given in 2 divided doses, which may be unequally split. Monitoring of urine succinylacetone and plasma alpha-fetoprotein, as well as liver function tests, must be carried out. If necessary, the daily dose may be increased to 1.5 mg/kg after one month; the maximum daily dose is 2 mg/kg. If satisfactory results are obtained from biochemical testing, doses should only be increased in line with body-weight gain.

Adverse effects have included granulocytopenia, leucopenia, and thrombocytopenia; regular monitoring of platelet and white cell counts is recommended. Eye disorders may occur due to increases in plasma tyrosine; they include conjunctivitis, corneal opacity, keratitis, photophobia, and eye pain. Slit-lamp examination of the eyes is recommended before starting treatment; patients developing visual disturbances during treatment should be referred to an ophthalmologist immediately, and further dietary restrictions implemented if plasma tyrosine is too high. Although it is not known if nitisinone is excreted into human milk, breast feeding is contra-indicated because of the potential effects on a suckling child.

Nitisinone is under investigation for the treatment of alkaptonuria, another hereditary metabolic disorder.

Preparations

Proprietary Preparations (details are given in Part 3)

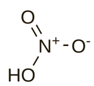
Belg.: Orfadin; ***Cz.:*** Orfadin; ***Denm.:*** Orfadin; ***Fin.:*** Orfadin; ***Fr.:*** Orfadin; ***Ger.:*** Orfadin; ***Neth.:*** Orfadin; ***Port.:*** Orfadin; ***Spain:*** Orfadin; ***Swed.:*** Orfadin; ***USA:*** Orfadin.

Nitric Acid

Acide nitrique; Acidum nitricum; Acidum Nitricum 70%; Aqua Fortis; Azotic Acid; Kwas azotowy; Kyselina dusičná 70%; Nit. Acid; Nitrato rūgštis; Nítrico, ácido; Salétromsav; Salpetersäure; Salpetersyra; Typpihappo.

HNO_3 = 63.01.

CAS — 7697-37-2.



Pharmacopoeias. In *Eur.* (see p.vii) (68 to 70%). Also in *USNF* (69 to 71%).

Ph. Eur. 6.2 (Nitric Acid). A clear, colourless to almost colourless liquid. Miscible with water. It contains 68.0 to 70.0% w/w of HNO_3. Protect from light.

USNF 26 (Nitric Acid). A highly corrosive fuming liquid, having a characteristic, highly irritating odour. It contains 69.0 to 71.0% w/w of HNO_3. Store in airtight containers.

Adverse Effects and Treatment

As for Hydrochloric Acid, p.2322.

There may be methaemoglobinaemia. Nitric acid stains the skin yellow.

Effects on the respiratory system. Respiratory failure due to pulmonary oedema occurred in a 56-year-old man after inhaling nitric acid which he had used as a metal cleaner.[1] The man died despite extensive ventilatory support.

1. Bur A, *et al.* Fatal pulmonary edema after nitric acid inhalation. *Resuscitation* 1997; **35:** 33–6.

Uses and Administration

Nitric acid has a powerful corrosive action and has been used to remove warts (p.1584), but it should be applied with caution, and less corrosive substances are available. It has also been used for the removal of tattoos.

Preparations

Proprietary Preparations (details are given in Part 3)

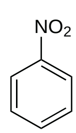
Multi-ingredient: ***Cz.:*** Solcogyn†; ***Ger.:*** Solco-Derman; ***Hong Kong:*** Solcoderm; ***Malaysia:*** Solcoderm†; ***Pol.:*** Solcogyn; ***Rus.:*** Solcoderm (Солкодерм); Solcovagin (Солковагин); ***Switz.:*** Solcoderm; Solcogyn.

Nitrobenzene

Aceite de mirbana; Nitrobenceno; Nitrobenzen; Nitrobenzol; Oil of Mirbane.

$C_6H_5NO_2$ = 123.1.

CAS — 98-95-3.



Adverse Effects

Nitrobenzene is highly toxic and the ingestion of 1 g may be fatal. Poisoning may occur from absorption through the skin, by inhalation, or by ingestion. Toxic effects are usually delayed for several hours and may include nausea, prostration, burning headache, methaemoglobinaemia with cyanosis, haemolytic anaemia, vomiting (with characteristic odour), convulsions, and coma, ending in death after a few hours.

Treatment of Adverse Effects

Although the benefit of gastric decontamination following ingestion of nitrobenzene is uncertain, gastric lavage or activated charcoal may be considered if given within 1 hour of ingestion. Methaemoglobinaemia may be treated with methylthioninium chloride. Oxygen should be given if cyanosis is severe.

If the skin or eyes are splashed with nitrobenzene, contaminated clothing should be removed immediately and the affected areas washed thoroughly with water at room temperature for at least 15 minutes.

Uses

Nitrobenzene is used in the manufacture of aniline, as a preservative in polishes, and in perfumery and soaps.

Nix-0699

Hemoxin; Nicosan; Niprisan.

Profile

Nix-0699 is an extract of the leaf of *Sorghum bicolor* (sorghum), the stem of *Pterocarpus osun* (camwood), the seed of *Piper guineense* (Ashanti or Benin pepper), and the flower of *Syzygium aromaticum*; *Eugenia caryophyllus* (clove). It is being investigated in the treatment of sickle-cell disease.

◊ Reviews.

Nucleic Acid

Acide Zymonucléique; Acidum Nucleicum; Nucleico, ácido; Nucleinic Acid.

Нуклеиновая Кислота

Profile

Nucleic acids, which are present in all cellular organisms and viruses, are composed of high molecular weight polynucleotides. A nucleotide is a phosphate ester of a nucleoside, which is made up of either a purine or pyrimidine nitrogenous base attached to a pentose sugar by an *N*-glycosidic linkage. Diester phosphate linkages between the sugar moieties produce a polynucleotide strand. Nucleic acids are of two types: deoxyribonucleic acid (DNA) (p.2293) and ribonucleic acid (RNA) (p.2379). Synthetic or recombinant nucleic acids are used in gene therapy (p.2310).

Since the administration of nucleic acid gives rise to a marked temporary leucocytosis (usually preceded by a short period of leucopenia) it was formerly given in the treatment of a variety of bacterial infections in the hope of enhancing the natural defence mechanisms. Its therapeutic value, however, has never been established.

Preparations

Proprietary Preparations (details are given in Part 3)

India: Nulip.

Nutmeg

Muscade; Myristica; Noz Moscada; Nuez moscada; Nux Moschata.

Description. Nutmeg consists of the dried kernels of the seeds of *Myristica fragrans* (Myristicaceae), containing not less than 5% v/w of volatile oil; the powdered drug contains not less than 4% v/w. Mace (see Mace Oil, p.2336) is the dried arillus of the seed of *M. fragrans*.

Pharmacopoeias. In *Chin.*

Adverse Effects

Nutmeg, taken in large doses, may cause nausea and vomiting, flushing, dry mouth, tachycardia, stimulation of the CNS possibly with epileptiform convulsions, miosis or occasionally mydriasis, euphoria, and hallucinations. Myristicin and elimicin are thought to be the constituents responsible for the psychotic effects of nutmeg, possibly because of metabolism to amfetamine-like compounds.

9. Stein U, *et al.* Nutmeg (myristicin) poisoning—report on a fatal case and a series of cases recorded by a poison information centre. *Forensic Sci Int* 2001; **118:** 87–90.

Uses and Administration

Nutmeg is the source of nutmeg oil (below). It is aromatic and carminative and is used as a flavour. Nutmeg has been reported to inhibit prostaglandin synthesis.

Homoeopathy. Nutmeg has been used in homoeopathic medicines under the following names: Myristica fragrans; Nux moschata; Nux. mos.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Mariazeller; ***Braz.:*** Paratonico; ***Cz.:*** Dr Theiss Schwedenbitter; Klosterfrau Melisana; Naturland Grosser Swedenbitter†; Original Schwedenbitter; ***Ger.:*** Doppelherz Melissengeist†; Melissengeist; ***Pol.:*** Melisana Klosterfrau; ***Rus.:*** Doppelherz Melissa (Доппельгерц Мелисса); Fitovit (Фитовит); Himcolin (Химколин); Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера); ***S.Afr.:*** Entressdruppels HM; Melissengeist; Rooilavental; Spiritus Contra Tussim Drops; ***Spain:*** Agua del Carmen; ***Switz.:*** Alcoolat de Melisse†; ***UK:*** Melissa Comp..

Nutmeg Oil

Átherisches Muskatöl; Esencia de Nuez Moscada; Essence de Muscade; Essência de Moscada; Muškátovníková silice; Muskatų eterinis aliejus; Muskotolja; Muskottiöljy; Myristica Oil; Myristicae Etheroleum; Myristicae fragrantis aetheroleum; Noix muscade, huile essentielle de; Nuez moscada, aceite esencial de; Oleum Myristicae; Szerecsendióolaj.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Nutmeg Oil). The oil obtained by steam distillation of the dried and crushed kernels of *Myristica fragrans*. A colourless to pale yellow liquid with a spicy odour. Store in well-filled, airtight containers. Protect from light and heat.

Profile

Nutmeg oil is aromatic and carminative and is used as a flavour. Nutmeg oil and expressed nutmeg oil, a solid fat, are rubefacient. Nutmeg oil is also used in aromatherapy.

Preparations

BP 2008: Aromatic Ammonia Spirit.

Proprietary Preparations (details are given in Part 3)

Nux Vomica

Brechnuss; Noce Vomica; Noix Vomique; Nuez vómica; Strychni Semen.

CAS — 357-57-3 (anhydrous brucine).

Pharmacopoeias. In *Chin.* and *Jpn.*

Profile

Nux vomica consists of the dried ripe seeds of *Strychnos nux-vomica* (Loganiaceae). It has the actions of strychnine (see p.2393). As well as containing strychnine, nux vomica contains brucine which has similar properties.

Nux vomica is used in herbal medicine for a wide variety of disorders including those of digestion or debility.

Homoeopathy. Nux vomica has been used in homoeopathic medicines under the following names: Nux vom.; Strychnos nux-vomica.

The dried ripe seeds of *Strychnos ignatii* have been used in homoeopathic medicines under the following names: Iamara; Ignatia; Ignatia amara; Ign..

Preparations

Proprietary Preparations (details are given in Part 3)

Oak Bark

Ąžuolų žievė; Chêne, écorce de; Common Oak; Corteza de roble; Dubová kůra; Durmast Oak; Écorce de Chêne; Eichenrinde; Ekbark; Kora dębowa; Quercus; Quercus cortex; Tammenkuori; Tölgyfakéreg.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Oak Bark). The cut and dried bark from the fresh young branches of *Quercus robur*, *Q. petraea*, and *Q. pubescens*. It contains a minimum of 3.0% of tannins, expressed as pyrogallol, calculated with reference to the dried drug.

Profile

Oak bark contains quercitannic acid. It has astringent properties and is used in some herbal preparations. It was formerly used for haemorrhoids and as a gargle.

Homoeopathy. Oak bark has been used in homoeopathic medicines under the following names: Quercus.

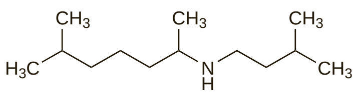
Octamylamine *(rINN)*

Octamilamina; Octamylaminum; Octisamyl hydrochloride (octamylamine hydrochloride). *N*-Isopentyl-1,5-dimethylhexylamine.

Октамиламин

$C_{13}H_{29}N = 199.4.$
CAS — 502-59-0 (octamylamine); 5964-56-7 (octamylamine hydrochloride).



Profile

Octamylamine is a smooth muscle relaxant that has been used as an antispasmodic. The hydrochloride and mucate salts have been used similarly.

Preparations

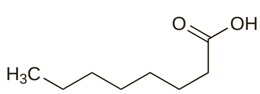
Proprietary Preparations (details are given in Part 3)
Gr.: Octinum-D†.

Octanoic Acid *(USAN, rINN)*

Acide caprylique; Acide Octanoïque; Ácido octanoico; Acidum caprylicum; Acidum Octanoicum; Caprylic Acid; Kaprilo rūgštis; Kaprilsav; Kaprylsyra; Kapryylihappo; Kwas kaprylowy; Kyselina oktanová.

Октановая Кислота

$CH_3.(CH_2)_6.CO_2H = 144.2.$
CAS — 124-07-2.



Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Caprylic Acid; Octanoic Acid BP 2008). A clear, colourless or slightly yellowish, oily liquid. Very slightly soluble in water; very soluble in alcohol and in acetone. It dissolves in dilute solutions of alkali hydroxides.

Sodium Octanoate

Natrii caprylas; Natrii Octanoas; Natrio kaprilatas; Nátrium-kaprilát; Natriumkaprylaatti; Natriumkaprylat; Natrium-oktanoát; Octanoato sódico; Sodium Caprylate; Sodium, caprylate de.

$C_8H_{15}NaO_2 = 166.2.$
CAS — 1984-06-1.

Pharmacopoeias. In *Eur.* (see p.vii). Also in *USNF.*

Ph. Eur. 6.2 (Sodium Caprylate). A white or almost white, crystalline powder. Very soluble or freely soluble in water; sparingly soluble in alcohol; freely soluble in acetic acid; practically insoluble in acetone. A 10% solution in water has a pH of 8.0 to 10.5.

USNF 26 (Sodium Caprylate). A white crystalline powder. Very soluble or freely soluble in water; sparingly soluble in alcohol; freely soluble in acetic acid; practically insoluble in acetone. A 10% solution in water has a pH of 8.0 to 10.5.

Profile

Octanoic acid and its salts have antifungal activity.

Sodium octanoate is used to stabilise albumin solution against the effects of heat. Octanoic acid labelled with carbon-13 has been used in a breath test to measure gastric emptying.

Preparations

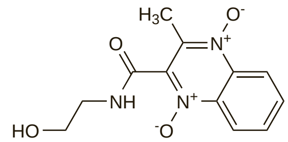
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Austral.:*** Caprilate.

Olaquindox *(BAN, rINN)*

Bay-Va-9391; Olaquindoxum. 2-(2-Hydroxyethylcarbamoyl)-3-methylquinoxaline 1,4-dioxide.

Олахиндокс

$C_{12}H_{13}N_3O_4 = 263.2.$
CAS — 23696-28-8.
ATC Vet — QJ01MQ01.



Profile

Olaquindox is an antibacterial added to animal feedstuffs as a growth promotor. Photoallergic reactions in animal handlers have been reported on exposure to olaquindox.

Oleander

Adelfa; Baladre; Common Oleander; Espirradeira; Laurier Rose; Oleanderblätter; Oleandri Folium; Rose Bay.

Profile

The dried leaves of the oleander shrub, *Nerium oleander* (Apocynaceae), contain cardioactive glycosides, including oleandrin. They have been used in the treatment of heart disorders. The flowers and bark have been used similarly. Toxicity, similar to that seen with digoxin, may occur after ingestion of any part of the plant; fatalities have been reported. Yellow oleander (*Thevetia peruviana*) also contains cardiac glycosides and exhibits similar toxicity to oleander.

Homoeopathy. Oleander has been used in homoeopathic medicines under the following names: Nerium oleander; Oleand.

Treatment of adverse effects. References to the treatment of oleander poisoning or yellow oleander poisoning.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Ger.:*** Miroton.

Olive

Oleae folium (olive leaf); Olivier, feuille d' (olive leaf).

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Olive Leaf; Oleae Folium). The dried leaf of *Olea europaea*. It contains a minimum of 5.0% of oleuropein ($C_{25}H_{32}O_{13}$ = 540.5), calculated on the dried basis. Protect from light.

Profile

The fresh or dried leaf of the olive, *Olea europaea* (Oleaceae), is used in herbal medicine for its antihypertensive and diuretic actions.

Olive fruit is the source of Olive Oil, p.2356.

Preparations

Proprietary Preparations (details are given in Part 3)
Austral.: Olivevital; ***Fr.:*** Oliviase†; ***Ger.:*** Olivysat.

Multi-ingredient: ***Austral.:*** Bioglan Bioage Peripheral; ***Fr.:*** B.O.P.; ***Ger.:*** Antihypertonicum S; Hypercircin.

Olive Oil

Aceite de oliva; Alyvuogių aliejus; Azeite; Huile d'Olive; Olej z oliwek; Oliiviöljy; Olivae oleum; Olivaolaj; Olive, huile d'; Olivenöl; Olivolja; Olivový olej.

Pharmacopoeias. In *Jpn.* Also in *USNF.*

Eur. (see p.vii) includes monographs for virgin olive oil and refined olive oil.

Ph. Eur. 6.2 (Olive Oil, Virgin; Olivae Oleum Virginale). The fatty oil obtained by cold expression or other suitable mechanical means from the ripe drupes of *Olea europaea*. It is a clear, yellow or greenish-yellow, transparent liquid with a characteristic odour. When cooled it begins to become cloudy at 10° and becomes a butter-like mass at 0°. Practically insoluble in alcohol; miscible with petroleum spirit (50° to 70°). Store in well-filled containers at a temperature not exceeding 25°. Protect from light.

Ph. Eur. 6.2 (Olive Oil, Refined; Olivae Oleum Raffinatum). The fatty oil obtained by refining of crude olive oil. A suitable antioxidant may be added. It is a clear, colourless, or greenish-yellow, transparent liquid. When cooled it begins to become cloudy at 10° and becomes a butter-like mass at about 0°. Practically insoluble in alcohol; miscible with petroleum spirit (50° to 70°). Store in well-filled containers at a temperature not exceeding 25°. Protect from light. Store under an inert gas if intended for use in the manufacture of parenteral dosage forms.

USNF 26 (Olive Oil). The fixed oil obtained from the ripe fruits of *Olea europaea* (Oleaceae). It may contain suitable antioxidants. It is a pale yellow, or light greenish-yellow, oily liquid, having a slight characteristic odour. Slightly soluble in alcohol; miscible with carbon disulfide, with chloroform, and with ether. Store in airtight containers at a temperature not exceeding 40°.

Profile

When taken internally, olive oil is nutrient, demulcent, and mildly laxative. It may also be given rectally (100 to 500 mL warmed to about 32°) to soften impacted faeces (p.1693).

Externally, olive oil is emollient and soothing to inflamed surfaces, and is used to soften the skin and crusts in eczema (p.1579) and psoriasis (p.1583), and as a lubricant for massage. It is used to soften ear wax (p.1725).

Olive oil is used in the preparation of liniments, ointments, plasters, and soaps; it is also used as a vehicle for oily suspensions for injection.

Epidemiological evidence points to the cardiovascular benefits of olive oil in the diet. Olive leaf (p.2356) is used in herbal medicine.

Preparations

BP 2008: Olive Oil Ear Drops.

Proprietary Preparations (details are given in Part 3)
Mex.: Oleomed†.

Multi-ingredient: ***Arg.:*** Calculina†; Clinoleic; ***Austral.:*** Gold Cross BOZ Ointment†; Snor-Away†; ***Austria:*** Clinoleic; OliClinomel; SMOFlipid; ***Braz.:*** Quelodin†; ***Cz.:*** Clinoleic; OliClinomel; SMOFlipid; ***Denm.:*** Clinoleic; OliClinomel; SMOFlipid; ***Fin.:*** Clinoleic; OliClinomel; ***Fr.:*** Clinoleic; Maghora; OliClinomel; ***Ger.:*** Clinoleic; OliClinomel; SMOFlipid; ***Gr.:*** Clinoleic; OliClinomel; SMOFlipid; ***Hung.:*** OliClinomel; SMOFlipid; ***Israel:*** Clinoleic; ***Ital.:*** Acumel; Clinoleic; OliClinomel; ***Mex.:*** Clinoleic†; ***Neth.:*** Clinoleic; OliClinomel; SMOFlipid; ***Norw.:*** SMOFlipid; ***NZ:*** Snorenz; ***Pol.:*** Clinoleic; SMOFlipid; ***Port.:*** Clinoleic; OliClinomel; ***Rus.:*** Olimetin (Олиметин)†; ***Spain:*** Aceite Acalorico; Clinoleic; Natusor High Blood Pressure†; OliClinomel; Tensiben†; ***Swed.:*** Clinoleic; OliClinomel; SMOFlipid; ***Switz.:*** Clinoleic; OliClinomel; ***Thai.:*** OliClinomel; ***UK:*** Clinoleic; OliClinomel; SMOFlipid; Snor-Away.

Ololiuqui

CAS — 2889-26-1 (isoergine); 478-94-4 (ergine); 2390-99-0 (chanoclavine); 548-43-6 (elymoclavine); 602-85-7 (lysergol).

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for 'morning glory' seeds:
Flying saucers; Glories; Heavenly blue; Pearly gates; Tlitlilzin; Yaxce'lil.

Profile

Ololiuqui consists of the seeds of *Rivea corymbosa* or *Ipomoea tricolor* (*I. violacea*) both convolvulaceous plants similar to the garden plant 'morning glory', *Ipomoea purpurea*. The brown seeds of *R. corymbosa* are known as 'badoh' and the black seeds of *I. tricolor* as 'badoh negro'.

Ololiuqui has hallucinogenic properties and is considered to be sacred by some Mexican Indians. Alkaloidal fractions contain at least 5 closely related individual components, namely D-isolysergic acid amide (isoergine), D-lysergic acid amide (ergine), chanoclavine, elymoclavine, and lysergol.

The name 'ololiuqui' has been erroneously applied to seeds of *Datura meteloides* (Solanaceae).

Onion

Cebolla; Cipolla; Oignon; Zwiebel.

Profile

Onion is the bulb of *Allium cepa* (Liliaceae). It has been reported to reduce platelet aggregation, lower serum cholesterol, and to enhance fibrinolysis. It has been used in preparations for the treatment of urinary-tract disorders and in topical preparations for scars and contractures.

Homoeopathy. Onion has been used in homoeopathic medicines under the following names: Cepa; Allium cepa; All. cepa.

Cardiovascular disease. A review of controlled studies purporting to show beneficial effects of garlic and/or onion on cardiovascular risk factors found those studies to have severe methodological failings.[1]

1. Kleijnen J, *et al.* Garlic, onions and cardiovascular risk factors: a review of the evidence from human experiments with emphasis on commercially available preparations. *Br J Clin Pharmacol* 1989; **28:** 535–44.

Stings. An onion bulb was used to treat the wound caused by a blue-spotted stingray (*Dasyatis kuhlii*).[1] Pain relief occurred within 30 minutes.

1. Whiting SD, Guinea ML. Treating stingray wounds with onions. *Med J Aust* 1998; **168:** 584.

Bitter Orange

Aurantii amari flos (bitter-orange flower); Aurantii Amari Pericarpium (bitter orange fruit); Bigaradier; Karčiavaisių citrinmedžių žiedai (bitter-orange flower); Keserű narancs virág (bitter-orange flower); Květ hořkého pomeranče (bitter-orange flower); Naranja Amarga; Naranja amarga, corteza de; Oranger amer, fleur d' (bitter-orange flower); Owocnia pomarańczy gorzkiej (bitter orange fruit); Pomeransblomma (bitter-orange flower); Pomeranssinkukka (bitter-orange flower); Pomeranze; Seville Orange.

Апельсин; Померанец

Pharmacopoeias. *Eur.* includes the dried peel and flowers. *Jpn* includes the peel.

Ph. Eur. 6.2 (Bitter-orange Epicarp and Mesocarp; Aurantii amari epicarpium et mesocarpium; Dried Bitter-orange Peel BP 2008). The dried epicarp and mesocarp of the ripe fruit of *Citrus aurantium*, partly freed from the white spongy tissue of the mesocarp and endocarp, containing a minimum of 2.0% v/w of essential oil, calculated with reference to the anhydrous drug. It has an aromatic odour and a spicy bitter taste.

Ph. Eur. 6.2 (Bitter-orange Flower; Aurantii amari flos). The whole, dried, unopened flower of *C. aurantium* subsp. *aurantium* containing a minimum of 8.0% of total flavonoids, expressed as naringin ($C_{27}H_{32}O_{14}$ = 580.5), calculated with reference to the dried drug.

Profile

The dried peel of the bitter orange, *Citrus aurantium* subsp. *aurantium* (*Citrus aurantium* subsp. *amara*) (Rutaceae) is used as a flavour and for its bitter and carminative properties. An essential oil is prepared from fresh bitter-orange peel (bitter-orange oil) and is similar to sweet orange oil (p.2357). Both bitter-orange oil and petitgrain bigarade oil (prepared from the leaves and twigs) are used in aromatherapy.

The flowers are an ingredient of herbal remedies used for nervous and sleep disorders. Bitter-orange flower is the source of Neroli Oil (p.2351).

The whole dried immature fruit is used similarly to the dried peel. In Chinese medicine, the dried immature fruits are known as zhi shi and zhi qiao.

Photosensitivity is associated with citrus oils.

Action and use. *Citrus aurantium* was one of the most frequently used herbal remedies in Puerto Rico.[1] Indications included sleep disorders, gastrointestinal disorders, respiratory ailments, and raised blood pressure.

The volatile oil of dried bitter-orange peel has shown antifungal activity.[2]

Bitter-orange extract has been added to herbal weight loss remedies as it contains the sympathomimetic synephrine (a name that has been used for both phenylephrine and oxedrine), which is claimed to increase metabolism and promote thermogenesis, although efficacy is not proven. Variant angina[3] and ischaemic colitis[4] have been reported in patients taking dietary supplements containing bitter orange, and reports of serious cardiovascular adverse effects possibly associated with the synephrine content of bitter orange present in such preparations have been received in Canada.[5,6] Raised systolic and diastolic blood pressure and heart rate were seen after ingestion of a proprietary bitter orange preparation in one small randomised placebo-controlled crossover study.[7] However, in a similar study[8] comparing a single-ingredient bitter orange preparation with a combination preparation, adverse haemodynamic effects appeared to be related to the additional presence of other possible stimulants such as caffeine, rather than directly proportional to the dose of bitter orange alone.

Preparations

BP 2008: Concentrated Compound Gentian Infusion; Concentrated Orange Peel Infusion; Orange Peel Infusion; Orange Syrup;
Ph. Eur.: Bitter-Orange-Epicarp and Mesocarp Tincture.

Proprietary Preparations (details are given in Part 3)
Ger.: Carvomin Magentropfen mit Pomeranze†.

Multi-ingredient: ***Arg.:*** Calmtabs†; Hepatodirectol; ***Austria:*** China-Eisenwein; Eicebaer; Ferrovin-Chinaeisenwein; Mariazeller; Montana; Sigman-Haustropfen; St Bonifatius-Tee; Tussimont; ***Canad.:*** Biotrim†; ***Cz.:*** Klosterfrau Melisana; Naturland Grosser Swedenbitter†; Pleumolysin; Schlaf-Nerventee N†; ***Fr.:*** Calmophytum; Elixir Bonjean; Elixir Grez†; Mediflor Tisane Calmante Troubles du Sommeil No 14; Quintonine; Vegetoserum; ***Ger.:*** Carminativum-Hetterich; Doppelherz Melissengeist†; Gallexier; Gastrosecur†; Montana N; Sedovent; ***Hong Kong:*** LEAN Formula w/ Advantra†; ***India:*** Toniazol†; ***Indon.:*** Jesscool; ***Israel:*** Passiflora; ***Ital.:*** Assenzio (Specie Composta)†; Gastro-Pepsin; Genziana (Specie Composta)†; Valeriana (Specie Composta)†; ***Pol.:*** Herbaton; Krople Zoladkowe; ***Rus.:*** Doppelherz Melissa (Доппельгерц Мелисса); Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера); ***S.Afr.:*** Versterkdruppels; ***Singapore:*** Chitosano; ***Spain:*** Euzymina Lisina I; Euzymina Lisina II; Jaquesor†; Natusor Jaquesan†; Sedonat; ***Switz.:*** Pastilles pectorales Demo N; Phytomed Nervo†; Tisane calmante pour les enfants; Tisane pour le sommeil et les nerfs; ***UK:*** Vital Eyes.

Sweet Orange

Naranja.

Pharmacopoeias. *Chin.* includes both the dried immature fruit of *Citrus aurantium* and its cultivated varieties and the dried young fruit of *C. aurantium*. *Swiss* includes the ripe fresh fruit of *Citrus sinensis*.

Profile

Sweet orange, *Citrus sinensis* (*Citrus aurantium* var. *dulcis*) (Rutaceae), is an ingredient of herbal remedies used for nervous and sleep disorders. The peel is the source of sweet orange oil (below). Citrus fruits are a source of vitamin C (p.1983).

Photosensitivity is associated with citrus oils.

Preparations

USNF 26: Orange Syrup; Sweet Orange Peel Tincture.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Expectal-Tropfen; Magentee St Severin; Mariazeller; ***Cz.:*** Passedan; ***Ger.:*** Majocarmin forte†; ***Rus.:*** Original Grosser Bittner Balsam (Оригинальный Большой Бальзам Биттнера).

Sweet Orange Oil

Apelsininių citrinmedžių vaisių žievelių eterinis aliejus; Apelsinolja; Appelsiininkuoriöljy; Arancia Dolce Essenza; Aurantii dulcis aetheroleum; Aurantii Dulcis Pericarpii Etheroleum; Essence of Orange; Essence of Portugal; Essência de Laranja; Naranja, aceite esencial de; Orange douce, huile essentielle d'; Orange Oil; Silice oplodí sladkého pomeranče.

NOTE. The oil from the flowers of *Citrus aurantium* var. *amara* is known as neroli oil or orange flower oil (p.2351).

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn*. Also in *USNF.*

Ph. Eur. 6.2 (Sweet Orange Oil). An essential oil obtained without heating, by suitable mechanical treatment from the fresh peel of the fruit of *Citrus sinensis* (*Citrus aurantium* var. *dulcis*). A suitable antoxidant may be added. It contains 0.4 to 0.6% α-pinene, 0.02 to 0.3% β-pinene, 0.2 to 1.1% sabinene, 1.7 to 2.5% β-myrcene, 92.0 to 97.0% limonene, 0.1 to 0.4% octanal, 0.1 to 0.4% decanal, 0.2 to 0.7% linalol, 0.02 to 0.10% neral, 0.02 to 0.5% valencene, and 0.03 to 0.02% geranial.

A clear, pale yellow to orange, mobile liquid, which may become cloudy when chilled. It has a characteristic odour of fresh orange peel. Relative density 0.842 to 0.850. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

USNF 26 (Orange Oil). The volatile oil obtained by expression from the fresh peel of the ripe fruit of *Citrus sinensis* (Rutaceae), containing not less than 1.2% w/v and not more than 2.5% w/v of aldehydes, calculated as decanal ($C_{10}H_{20}O$ = 156.3). It may be California-type or Florida-type orange oil. Store in well-filled airtight containers.

Profile

Sweet orange oil is used as a flavour, in perfumery, and in aromatherapy. It is used in the preparation of terpeneless orange oil. Photosensitivity reactions have been reported with citrus oils.

Preparations

USNF 26: Compound Orange Spirit.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Cz.:*** Coldastop; ***Ger.:*** GeloSitin; ***Hong Kong:*** Magesto; ***Switz.:*** Perskindol Classic; Pinimenthol†; Sansilla; Sibrovita; ***Thai.:*** Magesto.

Terpeneless Orange Oil

Naranja sin terpeno, aceite esencial de; Oleum Aurantii Deterpenatum.

Pharmacopoeias. In *Br.*

BP 2008 (Terpeneless Orange Oil). A clear yellow or orange-yellow liquid, visibly free from water, with the odour and taste of orange, prepared by concentrating orange oil under reduced pressure until most of the terpenes have been removed, or by solvent partition. It contains not less than 18% w/w of aldehydes calculated as decanal ($C_{10}H_{20}O$ = 156.3). Soluble 1 in 1 of alcohol (90%). Store in well-filled containers at a temperature not exceeding 25°. Protect from light.

Profile

Terpeneless orange oil consists chiefly of the free alcohols (+)-linalol and (+)-terpineol. It is used as a flavour. It is stronger in flavour and more readily soluble than the natural oil. Photosensitivity is associated with citrus oils.

Preparations

BP 2008: Compound Orange Spirit.

Orazamide *(rINN)*

AICA Orotate; Orazamida; Orazamidum; Oroxamide. 5-Aminoimidazole-4-carboxamide orotate dihydrate.

Оразамид

$C_9H_{10}N_6O_5,2H_2O$ = 318.2.

CAS — 2574-78-9 (anhydrous orazamide); 60104-30-5 (orazamide dihydrate).

Profile

Orazamide has been given orally in the treatment of liver disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Port.: Aicamin.

Multi-ingredient: ***Port.:*** Oraica†.

Orchis Mascula

Early Purple Orchid.

Ятрышник Мужской

Profile

Orchis mascula, which is alleged to have aphrodisiac properties, has been used in herbal preparations for male sexual disorders.

Salep, a flour made from the dried ground tubers of *Orchis mascula* and various other species of orchid, contains a nutritious mucilage called bassorin; ice-cream made from salep is a great delicacy in Turkey.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Rus.:*** Speman (Спеман); Speman Forte (Спеман Форте); Tentex (Тентекс).

Oregano

Dost; Origan; Origani herba; Origani Vulgaris Herba; Wild Marjoram.

CAS — 8007-11-2 (origanum oil).

NOTE. Distinguish from Marjoram, p.2337

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Oregano). The dried leaves and flowers, separated from the stems, of *Origanum onites* or *O. vulgare* subsp. *hirtum*, or a mixture of both species. It contains a minimum of 2.5% v/w of essential oil, which contains a minimum of 60% of carvacrol and thymol, calculated with reference to the anhydrous drug. Protect from light.

Profile

The aerial parts of oregano, *Origanum onites* (Lamiaceae), or *O. vulgare* or its subspecies, are used as a culinary herb and in herbal preparations.

There is some confusion over the naming of origanum oils. Oil from *O. vulgare* has been used medicinally. Origanum Oil is the oil obtained from *Coridothymus capitatus* (*Thymus capitatus*) but oils from other related species may also be referred to as origanum oils, and Oil of Origanum was also given as a synonym for Thyme Oil in BPC 1949. Preparations listed in *Martindale* as containing origanum oil may contain an oil from any of these related species.

Preparations

Proprietary Preparations (details are given in Part 3)

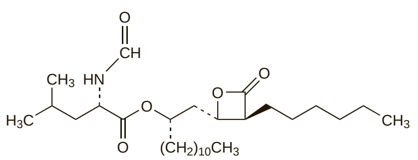
Multi-ingredient: ***Austral.:*** Gartech; ***Austria:*** Asthmatee EF-EM-ES; Baby Luuf; ***Cz.:*** Bronchosan; Fytokliman Planta; Melaton†; ***Pol.:*** Herbolen; Herbolen D; ***Spain:*** Pazbronquial; ***Switz.:*** Demonatur Capsules contre les refroidissements.

Orlistat *(BAN, USAN, rINN)*

Orlipastat; Orlistaatti; Orlistatum; Ro-18-0647; Ro-18-0647/002; Tetrahydrolipstatin. *N*-Formyl-L-leucine, ester with (3*S*,4*S*)-3-hexyl-4-[(2*S*)-2-hydroxytridecyl]-2-oxetanone; (*S*)-1-[(2*S*,3*S*)-3-Hexyl-4-oxo-oxetan-2-ylmethyl]dodecyl *N*-formyl-L-leucinate.

Орлистат

$C_{29}H_{53}NO_5$ = 495.7.
CAS — 96829-58-2.
ATC — A08AB01.
ATC Vet — QA08AB01.



Adverse Effects

Gastrointestinal disturbances, including faecal urgency and incontinence, flatulence, and fatty stools or discharge, are the most frequently reported adverse effects during treatment with orlistat. They may be minimised by limiting the amount of fat in the diet. Other reported effects have included headache, anxiety, fatigue, and menstrual irregularities. There have been concerns about an increased risk of breast cancer in patients taking orlistat but the manufacturers consider that there is no evidence of a causal link.

Effects on the cardiovascular system. A report of hypertension associated with orlistat therapy.[1] Blood pressure decreased on stopping orlistat and increased again on rechallenge. The authors noted that 13 cases of hypertension associated with orlistat had been reported to the manufacturers.

1. Persson M, *et al.* Orlistat associated with hypertension. *BMJ* 2000; **321:** 87.

Effects on the skin. Lichenoid drug eruption affecting the vulva, feet, and axillae has been reported in a woman during orlistat treatment.[1] Symptoms resolved on stopping orlistat with only the vulval lesions requiring topical treatment with mometasone furoate 0.1%.

1. Sergeant A, *et al.* Lichenoid eruption associated with orlistat. *Br J Dermatol* 2006; **154:** 1020–21.

Precautions

Orlistat should not be given to patients with chronic malabsorption syndrome or cholestasis and should be given with caution to patients with a history of hyperoxaluria or calcium oxalate nephrolithiasis. Adjustments to dosage of hypoglycaemics may be necessary in patients with type II diabetes because of improved metabolic control after weight loss in these patients. Supplements of fat-soluble vitamins may be necessary during long-term therapy, but they should be taken at least 2 hours before or after an orlistat dose or at bedtime. Hormonal contraceptive failure may occur in the event of severe diarrhoea with orlistat, and patients are advised to use an additional contraceptive method.

Interactions

Orlistat may reduce the absorption of fat-soluble vitamins. Licensed product information recommends that it not be taken with acarbose. In patients taking warfarin, international normalised ratio should be monitored during treatment with orlistat. A reduction in ciclosporin concentrations to subtherapeutic levels has been reported in transplant recipients given orlistat (see p.1826). Orlistat may also reduce the absorption of propafenone. For the possibility of hormonal contraceptive failure with orlistat see Precautions, above.

Pharmacokinetics

Orlistat is minimally absorbed after oral doses.

Uses and Administration

Orlistat is a gastric and pancreatic lipase inhibitor that limits the absorption of dietary fat. It is used together with dietary modification in the management of obesity (p.2149), i.e. in patients with a BMI of 30 kg/m^2 or greater. It may also be used in overweight patients with a BMI of 27 kg/m^2 or more if there are associated risk factors. Orlistat is given in a usual dose of 120 mg orally three times daily, immediately before, during, or up to 1 hour after meals. If a meal is missed or contains no fat, the dose should be omitted. Orlistat therapy should be stopped if the patient does not lose at least 5% of their body-weight during the first 12 weeks of therapy.

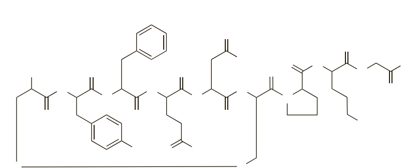
Ornipressin *(rINN)*

Ornipresina; Ornipressine; Ornipressinum. [8-Ornithine]-vasopressin.

Орнипрессин

$C_{45}H_{63}N_{13}O_{12}S_2$ = 1042.2.
CAS — 3397-23-7.
ATC — H01BA05.
ATC Vet — QH01BA05.



Profile

Ornipressin is a synthetic derivative of vasopressin (p.2411) with similar actions. It is reported to be a strong vasoconstrictor with only weak antidiuretic properties and is used to reduce bleeding during surgery. A solution containing up to 5 units in 20 to 60 mL of sodium chloride 0.9% is infiltrated into the area involved. Ornipressin is also used for bleeding oesophageal varices (under Monoethanolamine, p.2346) in a dose of 20 units diluted in 100 mL of sodium chloride 0.9% given as a continuous intravenous infusion over 48 hours.

◊ References.

2. De Kock M, *et al.* Ornipressin (Por 8): an efficient alternative to counteract hypotension during combined general/epidural anesthesia. *Anesth Analg* 2000; **90:** 1301–7.

Adverse effects. Acute pulmonary oedema occurred in a patient after infiltration of ornipressin (12 units in 40 mL isotonic saline) as a local vasoconstrictor during surgery.[1] It was suggested that no more than 100 milliunits/kg should be given in this manner.

1. Borgeat A, *et al.* Acute pulmonary oedema following administration of ornithine-8-vasopressin. *Br J Anaesth* 1990; **65:** 548–51.

Hepatorenal syndrome. Ornipressin has been found to be of benefit[1-4] in the hepatorenal syndrome, a form of renal insufficiency associated with cirrhosis of the liver, and thought to be due to severe renal vasoconstriction secondary to systemic arterial vasodilatation. However, caution in its use has been urged[2] because of the risk of ischaemic complications.

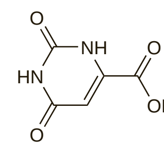
Orotic Acid *(BAN, pINN)*

Acide Orotique; Ácido orótico; Acidum Oroticum; Animal Galactose Factor; Orootihappo; Orotsyra; Uracil-6-carboxylic Acid; Vitamin B_{13}; Vitamina B_{13}; Whey Factor. 1,2,3,6-Tetrahydro-2,6-dioxopyrimidine-4-carboxylic acid.

Оротовая Кислота

$C_5H_4N_2O_4$ = 156.1.
CAS — 65-86-1 (anhydrous orotic acid); 50887-69-9 (orotic acid monohydrate).



Profile

Orotic acid, an intermediate in the biosynthesis of pyrimidine nucleotides, occurs naturally in the body and is also found in milk. Orotic acid and its calcium, carnitine, choline, lithium, lysine, and potassium salts have been used in liver disorders. Some of these salts, as well as chromium, cyproheptadine, deanol, magnesium, and zinc orotates have been given as tonics or dietary supplements.

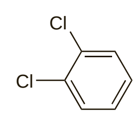
Orthodichlorobenzene

Ortodiclorobenceno. 1,2-Dichlorobenzene.

$C_6H_4Cl_2$ = 147.0.
CAS — 95-50-1.



Profile

Orthodichlorobenzene has been used as an ingredient of solutions for dissolving ear wax. It has also been used as a wood and furniture preservative. Orthodichlorobenzene is an irritant volatile liquid; lens opacities have occurred.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Cerumol; ***Switz.:*** Cerumenol.

Oryzanol

Gamma Oryzanol; Orizanol; γ-Oryzanol; γ-OZ. Triacontanyl 3-(4-hydroxy-3-methoxyphenyl)prop-2-enoate.

$C_{40}H_{58}O_4$ = 602.9.
CAS — 11042-64-1.

Profile

Oryzanol is a substance extracted from rice bran oil and rice embryo bud oil. It has been given orally in the treatment of hyperlipidaemias. It has also been used for its supposed effects on autonomic and endocrine function.

◊ References.

Multi-ingredient: ***Spain:*** Robervital.

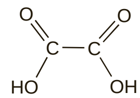
Oxalic Acid

Kwas szczawiowy; Oxálico, ácido.

$HO_2C.CO_2H,2H_2O$ = 126.1.

CAS — 144-62-7 (anhydrous oxalic acid); 6153-56-6 (oxalic acid dihydrate).

ATC Vet — QP53AG03.



Adverse Effects

On ingestion, severe gastroenteritis is produced by the corrosive action of oxalic acid and its soluble salts on the gastrointestinal tract. Burning of the mouth, throat, and oesophagus with ulceration may also occur. Hypoxia may occur in the presence of laryngeal oedema, and shock and hypotension may arise in severe cases. Oxalates can chelate body calcium following systemic absorption, and may produce symptoms of hypocalcaemia such as tetany, convulsions, and, in some cases, ventricular fibrillation. Oxalate crystals may be deposited in the blood vessels, brain, heart, liver, and lungs; deposition in the renal tubules leads to acute renal failure. The mean fatal dose of oxalates has been reported to be about 15 to 30 g, although death has occurred with much lower doses. Death may occur within a few hours of ingestion.

◊ Fatalities have resulted from intravenous administration of sodium oxalate[1] or ingestion of oxalic acid.[2]

Crystals of calcium oxalate present in the sap of daffodils[3] or *Agave tequilana* plants[4] have been reported to contribute to the rash experienced by workers coming into contact with these plants.

1. Dvořáčková I. Tödliche Vergiftung nach intravenöser Verabreichung von Natriumoxalat. *Arch Toxikol* 1966; **22:** 63–7.

3. Julian CG, Bowers PW. The nature and distribution of daffodil pickers' rash. *Contact Dermatitis* 1997; **37:** 259–62.
4. Salinas ML, *et al.* Irritant contact dermatitis caused by needle-like calcium oxalate crystals, raphides, in Agave tequilana among workers in tequila distilleries and agave plantations. *Contact Dermatitis* 2001; **44:** 94–6.

Treatment of Adverse Effects

After ingestion of oxalic acid, a dilute solution of any soluble calcium salt should be given to precipitate the oxalate; alternatively milk may be given. Oral activated charcoal has also been suggested if ingestion has occurred within 1 hour. Gastric lavage is contra-indicated by some centres given the corrosive nature of oxalic acid. Calcium gluconate 10% should be given intravenously to prevent tetany. Acute renal failure should be anticipated in surviving patients and calls for careful fluid management. Haemodialysis or peritoneal dialysis have also been suggested for the removal of oxalate in primary oxalosis in an attempt to prevent acute renal failure and correct hypocalcaemia.

Uses

Oxalic acid has varied industrial uses and has been used in escharotic preparations. Oxalic acid salts have been given orally and the urinary excretion of oxalate used as a screening test for lipid malabsorption.

Diagnostic use. References.

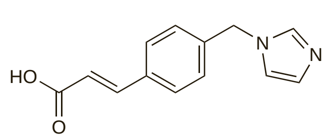
Ozagrel *(rINN)*

OKY-046 (ozagrel hydrochloride); Ozagrelum. (*E*)-*p*-(Imidazol-1-ylmethyl)cinnamic acid.

Озагрел

$C_{13}H_{12}N_2O_2$ = 228.2.

CAS — 82571-53-7.



Profile

Ozagrel is a thromboxane synthetase inhibitor that has been given orally as the hydrochloride for the treatment of asthma in doses of 200 mg twice daily. It has also been given as the sodium salt by intravenous infusion for the treatment of cerebrovascular disorders in a dose of 80 mg.

Palifermin *(USAN, rINN)*

AMJ-9701; Palifermina; Palifermine; Paliferminum; rHu-KGF. 24-163 Fibroblast growth factor 7 (human).

Палифермин

CAS — 162394-19-6; 178254-26-7.

ATC — V03AF08.

ATC Vet — QV03AF08.

Adverse Effects

Adverse reactions reported with palifermin therapy have included rash, erythema, oedema, pruritus, perioral dysaesthesia, tongue discoloration and thickening, and altered taste. Fever, and gastrointestinal and respiratory disturbances have also been reported. The safety and efficacy of palifermin in patients given treatment for non-haematological neoplasms has not been established; stimulation and growth of tumour cell lines have been found in *animal* and *in-vitro* models of non-haematopoietic human tumours.

Pharmacokinetics

The pharmacokinetics of palifermin were approximately dose-linear after a single intravenous dose in healthy subjects given larger than usual doses. The terminal elimination half-life is about 4.5 hours.

Uses and Administration

Palifermin is a human recombinant keratinocyte growth factor (KGF) used to reduce the incidence and duration of severe oral mucositis (p.640) in patients with haematological neoplasms who receive myelotoxic chemotherapy, with or without radiotherapy, followed by haematopoietic stem cell transplantation. The recommended course of palifermin is 6 doses of 60 micrograms/kg, by intravenous bolus injection. A dose is given on each of 3 consecutive days before, and 3 consecutive days after, myelotoxic therapy. Palifermin should not be given during, or for 24 hours before or after, myelotoxic therapy. Thus, the third pre-chemotherapy dose of palifermin should be given 24 to 48 hours before myelotoxic therapy, and the first post-chemotherapy dose of palifermin should be given after, but on the same day as, the haematopoietic stem cell infusion, and at least 4 days after the third pre-myelotoxic dose.

Mucositis. Palifermin is a human recombinant keratinocyte growth factor (KGF) that binds to KGF receptors and repairs damaged epithelium by stimulating the proliferation, differentiation, and migration of epithelial cells.[1,2] Controlled studies have shown it to be effective in reducing the severity and duration of oral mucositis (p.640) in patients receiving myelotoxic therapy for haematological neoplasms and requiring haematopoietic stem cell support.[3,4] It has also shown benefit compared with placebo in reducing the incidence of oral mucositis and diarrhoea in patients receiving fluorouracil and leucovorin for metastatic colorectal cancer.[5]

Pancreatic Enzymes

Pancreatin *(BAN)*

Haimajauhe (pancreas powder); Kasos milteliai (pancreas powder); Pancréas, poudre de (pancreas powder); Pancreatina; Pancreatinum; Pancreatis pulvis (pancreas powder); Pankreaspulver (pancreas powder); Pankreatiini; Pankreatin; Pankreáz-por (pancreas powder).

CAS — 8049-47-6.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), *Jpn*, and *US* as pancreatin or another pancreatic exocrine extract or both.

Ph. Eur. 6.2 (Pancreas Powder; Pancreatis Pulvis; Pancreatic Extract BP 2008). It is prepared from the fresh or frozen pancreases of mammals. It contains various enzymes having proteolytic, lipolytic, and amylolytic activities. Each mg of pancreas powder contains not less than 1 Ph. Eur. unit of total proteolytic activity, not less than 15 Ph. Eur. units of lipolytic activity, and not less than 12 Ph. Eur. units of amylolytic activity. A slightly brown, amorphous powder. Partly soluble in water; practically insoluble in alcohol. Store in airtight containers.

BP 2008 (Pancreatin). A preparation of mammalian pancreas containing enzymes having protease, lipase, and amylase activity. Each mg of pancreatin contains not less than 1.4 FIP units of free protease activity, not less than 20 FIP units of lipase activity, and not less than 24 FIP units of amylase activity. It may contain sodium chloride. A white or buff amorphous powder, free from unpleasant odour. Soluble or partly soluble in water forming a slightly turbid solution; practically insoluble in alcohol and in ether. Store at a temperature not exceeding 15°.

USP 31 (Pancreatin). A substance containing enzymes, principally amylase, lipase, and protease, obtained from the pancreas of the hog or of the ox. It is a cream-coloured, amorphous powder, having a faint, characteristic, but not offensive odour. Its greatest activities are in neutral or faintly alkaline media; more than traces of mineral acids or large amounts of alkali hydroxides make it inert. An excess of alkali carbonate also inhibits its action.

Pancreatin contains, in each mg, not less than 25 USP units of amylase activity, not less than 2 USP units of lipase activity, and not less than 25 USP units of protease activity. Pancreatin of a higher digestive power may be labelled as a whole-number multiple of the 3 minimum activities, or may be diluted with lactose, or with sucrose containing not more than 3.25% of starch, or with pancreatin of lower digestive power. Store in airtight containers at a temperature not exceeding 30°.

Pancrelipase *(USAN)*

Pancrelipasa.

CAS — 53608-75-6.

Pharmacopoeias. In *US.*

USP 31 (Pancrelipase). A substance containing enzymes, principally lipase, with amylase and protease, obtained from the pancreas of the hog. It is a cream-coloured, amorphous powder having a faint characteristic, but not offensive odour. Its greatest activities are in neutral or faintly alkaline media; more than traces of mineral acids or large amounts of alkali hydroxides make it inert. An excess of alkali carbonate also inhibits its action. Pancrelipase contains, in each mg, not less than 24 USP units of lipase activity, not less than 100 USP units of amylase activity, and not less than 100 USP units of protease activity. Store in airtight containers preferably at a temperature not exceeding 25°.

Units

The Ph. Eur. and USP units of protease activity depend upon the rate of hydrolysis of casein, those of lipase activity depend upon the rate of hydrolysis of olive oil, and those of amylase activity depend upon the rate of hydrolysis of starch. Because of differences in the assay conditions, the Ph. Eur. and USP units are not readily comparable.

FIP units of protease, lipase, and amylase activity are approximately equivalent to Ph. Eur. units.

Adverse Effects and Precautions

Pancreatic enzyme supplements commonly cause gastrointestinal adverse effects such as abdominal discomfort and nausea and vomiting. They may also cause buccal and perianal irritation, particularly in infants. Colonic strictures (fibrosing colonopathy) have occurred, mainly in children with cystic fibrosis receiving high doses of pancreatin preparations; the use of high doses in patients with cystic fibrosis should preferably be avoided (see Effects on the Gastrointestinal Tract, below). Adequate hydration should be maintained at all times in patients receiving higher strength preparations.

Hypersensitivity reactions have been reported; these may be sneezing, lachrymation, or skin rashes. Hyperuricaemia or hyperuricosuria have occurred with high doses. There have been occasional reports of the contamination of pancreatin preparations with *Salmonella* spp.

Effects on folic acid. Pancreatic extract significantly inhibited folate absorption in healthy subjects and in pancreatic insufficient patients.[1] Testing *in vitro* showed that pancreatic extract formed insoluble complexes with folate. It was suggested[1] that patients being treated for pancreatic insufficiency should be monitored for folate status or given folic acid supplementation, particularly if pancreatic enzymes and bicarbonate (or cimetidine) were being used together in the treatment regimen.

1. Russell RM, *et al.* Impairment of folic acid absorption by oral pancreatic extracts. *Dig Dis Sci* 1980; **25:** 369–73.

Effects on the gastrointestinal tract. *FIBROSING COLONOPATHY.* After the introduction of high-strength pancreatic enzyme preparations, there were a number of reports[1-6] of colonic strictures in children with cystic fibrosis who received these formulations, and the problem, now dubbed fibrosing colonopathy, was reviewed.[7,8] Fibrosing colonopathy has also been reported[9] in an adult who was not thought to have cystic fibrosis, but who had been taking high doses of pancreatic enzyme supplements, including 2 with methylacrylic acid copolymer (MAC) coatings, for 5 years after surgical removal of the pancreas.

The pathogenesis and aetiology of this condition still remain unclear. Dose-related thickening of the colon wall has been described,[10] and an inflammatory or immune-mediated mechanism has been suggested.[11,12] It has also been suggested that the type of preparation used may have a role. An analysis[13] of cases of fibrosing colonopathy occurring in the UK between 1984 and 1994 demonstrated that there was a dose-related association between the high-strength preparations and this adverse effect although there was some criticism and debate surrounding the methodology of this particular analysis.[14-16] A subsequent case-control study[17] of patients in the US presenting between 1990 and 1994 concluded that there was a strong association between high daily doses of pancreatic enzymes, in any form, and the development of fibrosing colonopathy; no significant differences were observed between the various high- and low-strength preparations used. Re-analysis[18] of the UK data found a highly statistically significant association with the intake of preparations using MAC for enteric coating, but no evidence that a high intake of lipase in the absence of MAC was a risk factor for the disease. However, at least one case has been reported with a preparation that did not contain this material.[19]

As a result of these problems, high-strength preparations were withdrawn in the USA, while in the UK, the CSM recommended[20] that unless special reasons exist, patients with cystic fibrosis should not use high-strength pancreatin preparations, and that all patients treated with these products should be monitored carefully for gastrointestinal obstruction. The CSM later elaborated on these recommendations:[21] they advised that *Nutrizym 22, Pancrease HL,* and *Panzytrat 25 000* [now discontinued in the UK] should not be used in children with cystic fibrosis who were aged 15 years or less; that the total daily dose of pancreatic enzyme supplements for patients with cystic fibrosis should not exceed a lipase activity of 10 000 units/kg; and that patients on any pancreatin preparation should be reviewed to exclude colonic damage if new abdominal symptoms or a change in symptoms occurred. Other risk factors identified were male sex, more severe cystic fibrosis, and the concomitant use of laxatives.[21] The US Cystic Fibrosis Foundation has made recommendations for the management of patients who do not respond adequately to moderate doses of pancreatic enzymes,[22] and similar recommendations have been made in the UK.[23]

Uses and Administration

Pancreatic enzymes (as pancreatin or pancrelipase) hydrolyse fats to glycerol and fatty acids, break down protein into peptides, proteoses and derived substances, and convert starch into dextrins and sugars. They are given by mouth in conditions of pancreatic exocrine deficiency such as pancreatitis and cystic fibrosis. They are available in the form of powder, capsules containing powder or enteric-coated granules (which may be opened before use and the contents sprinkled on soft food), enteric-coated tablets, or granules. If pancreatic enzymes are mixed with liquids or food the resulting mixture should not be allowed to stand for more than 1 hour before use. Histamine H_2-receptor antagonists, such as cimetidine or ranitidine, have been given an hour before a dose in an attempt to lessen destruction of the pancreatic enzymes by gastric acid, or proton pump inhibitors such as omeprazole may be used; alternatively, antacids may be given with the dose.

The dose of pancreatic enzymes is adjusted according to the needs of the individual patient and will also depend on the dosage form. In the UK, proprietary preparations generally provide about 5 000 to 10 000 units of lipase activity per dose-unit and usual doses, given with each meal, range from about 5 000 to 56 000 units of lipase activity (with varying proportions of protease and amylase activity, depending on the preparation). In the USA, doses providing up to 40 000 USP units of lipase activity may be given with each meal. So-called high-strength or high-potency preparations are available for those receiving high doses, and typically contain about 20 000 to 40 000 units of lipase activity per dose unit, but their use has been associated with the development of fibrosing colonopathy in children with cystic fibrosis (see Effects on the Gastrointestinal Tract, above). Such preparations are consequently not recommended for children in the UK and authorities there consider the total daily dose of pancreatic supplements for patients with cystic fibrosis should not exceed a lipase activity of 10 000 units/kg.

Purified lipase preparations have also been used. A recombinant human bile-salt stimulated lipase is under investigation for the treatment of fat malabsorption in patients with exocrine pancreatic insufficiency and cystic fibrosis.

Pancreatin is also used to remove protein deposits from the surface of soft contact lenses (p.1622).

Cystic fibrosis. Patients with cystic fibrosis (p.166) suffer from pancreatic insufficiency and consequent malabsorption. Pancreatin or pancrelipase may therefore play a role in the management of the disorder, being taken before or with each meal or snack.

Generic substitution. Three patients with cystic fibrosis whose gastrointestinal symptoms had been well controlled with pancrelipase developed symptoms after substitution of generic pancrelipase for their previous brand.[1] The generic product had a different lipase content and was almost inactive at stomach pH *in vitro*, apparently because of a defective enteric coating. Different brands of pancrelipase may not be therapeutically equivalent and should not be routinely substituted.

1. Hendeles L, *et al.* Treatment failure after substitution of generic pancrelipase capsules: correlation with in vitro lipase activity. *JAMA* 1990; **263:** 2459–61.

Pancreatitis. Pancreatitis is an inflammatory process affecting the pancreas. Acute pancreatitis comprises necrosis of pancreatic tissue occurring in an otherwise healthy gland, whereas chronic pancreatitis is the manifestation of pathological processes resulting in inflammation and progressive fibrosis of pancreatic tissue. Acute disease may be superimposed on a background of chronic pancreatitis.

Acute pancreatitis is frequently associated with either biliary-tract disorders (such as gallstones or cholecystitis) or the intake of large amounts of alcohol, or less frequently with abdominal surgery, pancreatic trauma, hyperparathyroidism, hyperlipidaemia, infection, or the adverse effects of drugs. Endoscopic retrograde cholangiopancreatography (ERCP) is followed by acute pancreatitis in anywhere between 3 and 40% of patients,[1] although it may also be used successfully to treat acute pancreatitis associated with gallstones.[2]

Symptoms of acute pancreatitis include pain, which ranges from mild to extremely severe and which typically persists for several days, nausea and vomiting, ileus, and hypovolaemic shock. In severe disease, pulmonary, renal, and hepatic failure, encephalopathy, and death may ensue. A mortality rate of about 10% has been reported.

The management of acute disease is essentially supportive.[1,3-8] Adequate analgesia for pain is important (see Pancreatic Pain, p.9); in mild cases, analgesia, adequate hydration, and temporary interruption of oral intake of food to 'rest' the pancreas may be adequate. In more severe disease enteral or parenteral nutrition may be needed,[1,7] although some[5,6,8] advocate enteral over parenteral nutrition because of potential complications with the latter. Since most patients suffer from hypoxaemia it has been recommended that they should receive additional humidified oxygen by mask, with mechanical ventilation if blood gases indicate the development of severe pulmonary failure. Shock should be managed with blood or plasma, and electrolyte solutions, while insulin may be required for disturbances of glucose homoeostasis.

The value of other interventions is mostly doubtful. As an extension of the concept of 'pancreatic rest', inhibitors of pancreatic secretion including somatostatin or octreotide have been tried but without significant effect, while protease inhibitors such as aprotinin or gabexate mesilate have also proven disappointing,[3] perhaps because activation of pancreatic proteases (thought to play a significant role in pathogenesis) has already taken place by the time therapy is begun.[3] A meta-analysis[9] of studies using aprotinin or gabexate mesilate suggested that these might reduce mortality in moderate to severe acute pancreatitis. However, this conclusion has been criticised[10] based on weaknesses in the original studies and the criteria used for severity grading. Gabexate and somatostatin may have roles in the prevention of acute pancreatitis after ERCP,[11] but it remains difficult to identify which patients should be offered prophylaxis, since not all will develop the condition.[1,3] Furthermore, it has been suggested[12] that with improved techniques, the use of prolonged infusions of pharmacological prophylaxis against severe pancreatitis after ERCP may no longer be justified. Preliminary studies of the platelet-activating factor antagonist lexipafant for treatment of pancreatitis were initially promising but were not supported by subsequent larger studies.[4]

Although prophylactic antibacterials are often given, there has been some uncertainty about their value (see p.183). In a review[13] of the treatment of acute necrotising pancreatitis, it was pointed out that early studies that failed to show any benefit of prophylactic antibacterials had also included patients with interstitial oedematous acute pancreatitis. The authors emphasised that the prevention of infection is critical in acute necrotising pancreatitis, since the development of infected necrosis substantially increases mortality, and concluded that use of antibacterials is the mainstay of management in such patients. Some[6] do not recommend antibacterial prophylaxis in patients with necrotising pancreatitis; for others,[8] accepted treatment is to start intravenous imipenem or meropenem for 14 days when infection is suspected but to stop it rapidly if not confirmed, although this view was challenged.[14] A systematic review[15] found that antibacterial prophylaxis appeared to be associated with significantly decreased mortality in patients with pancreatic necrosis but there was no significant reduction in the rates of infected pancreatic necrosis. It is also possible that beta lactams might be preferable to quinolone plus imidazole regimens, although no firm conclusions could be drawn because of small sample size. Further better designed studies are needed to support antibacterial prophylaxis and, should these prove beneficial, to compare beta lactams with quinolones directly.

The role of surgery continues to be somewhat controversial; it is accepted for complications or when a potential surgical emergency exists.[1,3,5-8] Surgery to remove the gallbladder is usually delayed in severe episodes of acute, gallstone-related pancreatitis to allow resolution of the inflammatory process and improvement in the patient's nutritional state.[1] Early ERCP to clear an obstructed bile duct may reduce complications in patients with predicted severe pancreatitis, but does not reduce mortality.[2]

Chronic pancreatitis is frequently associated with high alcohol-intake although a tropical form,[1] associated with malnutrition, also exists, and some cases are idiopathic[16] or auto-immune.[17] Symptoms include recurrent episodes of pain (often less excruciating and of shorter duration than in acute pancreatitis) which normally become less severe and frequent over the years with the inexorable progression of fibrosis. Loss of exocrine tissue eventually leads in many patients to pancreatic exocrine insufficiency, with maldigestion and steatorrhoea, and in some to diabetes mellitus due to islet cell loss. Other symptoms may include cholestatic jaundice, fatty degeneration of the liver, stenosis of the bile duct, and hepatic cirrhosis (although this may also be due to alcohol intake). It has been estimated that more than 50% of patients die within 20 years of diagnosis, with those who continue to drink alcohol being at greatest risk. In some patients, chronic pancreatitis is a premalignant disorder.[1]

Adequate analgesia with opioids is essential (see Pancreatic Pain, p.9). Nerve blocks of the coeliac plexus with phenol or alcohol have generally proved disappointing, although coeliac plexus blocks using corticosteroids and local anaesthetic may be effective.[1] However, response to nerve ablation procedures is often limited and of short duration.[16] Patients should be advised to abstain from alcohol, which can exacerbate the frequency and severity of painful episodes.[1] A low-fat diet is also recommended, or for patients who cannot tolerate oral intake, parenteral or enteral nutrition.[16] Steatorrhoea requires replacement of pancreatic enzymes with preparations of pancreatin or pancrelipase. Because the enzymes are inactivated by gastric acid they may be taken after inhibitors of acid secretion[1] or with a sodium-containing antacid such as sodium bicarbonate (magnesium-, calcium-, and possibly aluminium-containing antacids may further interfere with fat absorption). Alternatively, enteric-coated enzyme preparations may be used.[16] In some patients with mild disease pancreatic enzyme replacement may also improve pain, although for this purpose only non-enteric coated preparations are effective.[16] Supplements of fat-soluble vitamins are not normally necessary, but may be given intravenously if required. Diabetes should be managed appropriately once steatorrhoea is under control.

Surgery, up to and including total pancreatectomy, has an important role in the relief of intractable pain, and may also be necessary for the management of complications.[1,16] Endoscopic decompression using contrast media containing prednisolone and ulinastatin has been reported to produce beneficial responses.[18] Anecdotal results suggest that some patients with pancreatic pseudocysts, which usually require surgical drainage, may respond to octreotide.[19]

Pancreozymin *(BAN)*

CCK-PZ; Pancreocimina; Pankreotsymiini; Pankreozymin.

ATC — V04CK02.

ATC Vet — QV04CK02.

NOTE. The endogenous hormone is known as cholecystokinin (CCK).

Units

The potency of pancreozymin may be expressed as Crick-Harper-Raper units based on the pancreatic secretion in *cats* or as Ivy *dog* units based on the increase in gallbladder pressure. One Ivy dog unit is considered to be approximately equivalent to 1 Crick-Harper-Raper unit.

Profile

Pancreozymin is a polypeptide hormone prepared from the duodenal mucosa of *pigs*. When given by intravenous injection it causes an increase in the secretion of pancreatic enzymes and stimulates gallbladder contraction.

Pancreozymin has been used, usually with secretin, as a test for exocrine pancreatic function and in the diagnosis of biliary-tract disorders; these tests generally involved duodenal intubation of the patient and examination of duodenal aspirate. Pancreozymin has also been used as an adjunct to cholecystography. Vasomotor reactions, abdominal discomfort, and hypersensitivity have been reported.

Biliary-tract disorders. It was concluded that cholecystokinin provocation testing was ineffective in predicting which patients with acalculous biliary pain would receive symptomatic relief from cholecystectomy in a study involving 58 patients.[1]

1. Smythe A, *et al*. A requiem for the cholecystokinin provocation test? *Gut* 1998; **43:** 571–4.

Pangamic Acid

Pangámico, ácido.

Profile

The name pangamic acid has been applied variously to gluconic acid 6-[bis(diisopropylamino)acetate] ($C_{20}H_{40}N_2O_8$ = 436.5), gluconic acid, 6-ester with N,N-dimethylglycine ($C_{10}H_{19}NO_8$ = 281.3), gluconic acid, 6-ester with N,N-diisopropylglycine ($C_{14}H_{27}NO_8$ = 337.4), and a substance or mixture of substances isolated from apricot kernels and rice bran. It has also been known as 'vitamin B_{15}' although there is no evidence that pangamic acid is a vitamin. Preparations containing the vasoactive substance di-isopropylammonium dichloroacetate (p.1265) have sometimes been described as pangamic acid or 'vitamin B_{15}'. There is much uncertainty about the identity of products sold in health food stores as 'vitamin B_{15}', pangamic acid, or sodium or calcium pangamate and different brands have been reported to have completely different compositions.

Claims for the activity of pangamic acid as a promotor of tissue oxygenation and its alleged value in numerous disorders have not been substantiated.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: B15†; ***Ger.:*** Oyo†; ***Port.:*** Desfatigan; Pulsor.

Multi-ingredient: ***Mex.:*** B1-12-15; ***Spain:*** Policolinosil.

Panthenol *(BAN, USAN, rINN)*

Pantenol; Panthénol; *dl*-Panthenol; Panthenolum; (±)-Pantothenyl Alcohol.

Пантенол

$C_9H_{19}NO_4$ = 205.3.
CAS — 16485-10-2.

Pharmacopoeias. In *US.*

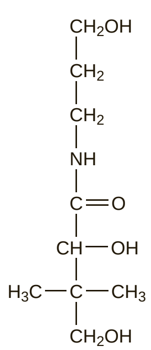
USP 31 (Panthenol). A racemic mixture of the dextrorotatory and laevorotatory isomers of panthenol. A white to creamy white, crystalline powder with a slight, characteristic odour. Freely soluble in water, in alcohol, and in propylene glycol; soluble in chloroform and in ether; slightly soluble in glycerol. Store in airtight containers.

Dexpanthenol *(BAN, USAN, rINN)*

Dekspantenoli; Dekspantenolis; Dexpantenol; Dexpanthénol; Dexpanthenolum; Dextro-Pantothenyl Alcohol; Pantothenol; Provitamin B_5. (*R*)-2,4-Dihydroxy-*N*-(3-hydroxypropyl)-3,3-dimethylbutyramide.

Декспантенол

$C_9H_{19}NO_4$ = 205.3.
CAS — 81-13-0.
ATC — A11HA30; D03AX03; S01XA12.
ATC Vet — QA11HA30; QD03AX03; QS01XA12.



Pharmacopoeias. In *Eur.* (see p.vii), *US*, and *Viet.*

Ph. Eur. 6.2 (Dexpanthenol). A colourless or slightly yellowish, hygroscopic, viscous liquid, or a white or almost white, crystalline powder. Very soluble in water; freely soluble in alcohol. A 5% solution in water has a pH not greater than 10.5. Store in airtight containers.

USP 31 (Dexpanthenol). A clear, viscous, somewhat hygroscopic liquid, having a slight characteristic odour. Some crystallisation may occur on standing. Freely soluble in water, in alcohol, in methyl alcohol, and in propylene glycol; soluble in chloroform and in ether; slightly soluble in glycerol. Store in airtight containers.

Adverse Effects and Precautions

There have been a few reports of allergic reactions possibly associated with dexpanthenol. Dexpanthenol is contra-indicated in haemophiliacs and in patients with ileus due to mechanical obstruction.

Uses and Administration

Dexpanthenol is the alcoholic analogue of D-pantothenic acid (p.1959). It has been given intramuscularly in doses of 250 to 500 mg to prevent or control gastrointestinal atony but its value has not been established. It has also been given by slow intravenous infusion.

Dexpanthenol and the racemate panthenol have been used topically in strengths of 2 or 5% for the treatment of various minor skin disorders. They are also included in some vitamin preparations.

Papain

Papaína; Papaina; Papayotin.
CAS — 9001-73-4.

Pharmacopoeias. In *US.*

USP 31 (Papain). A purified proteolytic substance derived from *Carica papaya* (Caricaceae). It contains not less than 6000 USP units per mg. A white to light tan, amorphous powder. Soluble in water, the solution being colourless to light yellow and more or less opalescent; practically insoluble in alcohol, in chloroform, and in ether. pH of a 2% solution in water is between 4.8 and 6.2. Store in airtight containers at a temperature of 8° to 15°. Protect from light.

Units

USP 31 defines the USP unit of papain activity as the activity that releases the equivalent of 1 microgram of tyrosine from a specified casein substrate under the conditions of the assay, using the enzyme concentration that liberates 40 micrograms of tyrosine per mL of test solution.

One FIP unit of papain is defined as the enzyme activity which under specified conditions hydrolyses 1 micromol of *N*-benzoyl-L-arginine ethyl ester per minute.

The Warner-Chilcott unit, based on the quantity of enzyme required to clot 2.64 microlitre of milk substrate in 2 minutes at 40°, under specified conditions, has also been used for papain.

Adverse Effects

Hypersensitivity reactions have occurred.

Effects on the eyes. Ocular and periorbital angioedema occurring within 4 hours of use of a contact lens cleansing solution containing papain has been reported.[1]

1. Bernstein DI, *et al*. Local ocular anaphylaxis to papain enzyme contained in a contact lens cleansing solution. *J Allergy Clin Immunol* 1984; **74:** 258–60.

Oesophageal perforation. Extensive destruction of the oesophageal wall, with perforation, resulted from the use of a papain suspension given to treat an obstruction caused by impacted meat.[1] The patient had been given 1.2 g of papain over a 12-hour period. Ten days after a thoracotomy, the descending thoracic aorta ruptured, and she died from haemorrhage.

1. Holsinger JW, *et al*. Esophageal perforation following meat impaction and papain ingestion. *JAMA* 1968; **204:** 734–5.

Uses and Administration

Papain consists chiefly of a mixture of papain and chymopapain, proteolytic enzymes that hydrolyse polypeptides, amides, and esters, especially at bonds involving basic amino acids, or leucine or glycine, yielding peptides of lower molecular weight. It is used with urea as a topical debriding agent. It is also used for the removal of protein deposits from the surface of soft contact lenses (p.1622).

Preparations of papain, alone or combined with antibacterial agents and/or other substances, have been taken orally for their supposed anti-inflammatory properties, and it has also been used as an ingredient of various mixtures claimed to aid digestion.

Papain is widely used as a meat tenderiser and in the clarification of beverages.

Malignant neoplasms. Papain has been included in proteolytic enzyme preparations used in oncology to reduce the adverse effects of chemotherapy and radiotherapy. Although the number of clinical studies on which to judge efficacy is limited, a review[1] of such studies suggested that systemic enzyme therapy might be beneficial. Clinical studies have used a preparation containing papain, trypsin, and chymotrypsin in a weight ratio of 5:2:2, and the beneficial effect seems to be based on its anti-inflammatory potential.

1. Leipner J, Saller R. Systemic enzyme therapy in oncology: effect and mode of action. *Drugs* 2000; **59:** 769–80.

Preparations

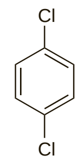
Paradichlorobenzene

Dichlorbenzol; Paradiclorobenceno. 1,4-Dichlorobenzene.
$C_6H_4Cl_2$ = 147.0.
CAS — 106-46-7.



Profile

Paradichlorobenzene has general properties similar to those of orthodichlorobenzene (see p.2358) but is considered to be less toxic. It is present in several preparations intended for the removal of ear wax (see p.1725). It has been used as a furniture preservative and in mothballs and lavatory deodorant blocks. Abuse of preparations containing paradichlorobenzene has been reported.

Abuse. Neurocutaneous symptoms have been reported[1] in 2 18-year-old twin girls after abuse of mothballs by inhaling the fumes, and in one twin, also chewing the mothballs. Once they stopped, both sisters recovered completely within 3 to 6 months depending on their previous level of abuse.

1. Feuillet L, *et al.* Twin girls with neurocutaneous symptoms caused by mothball intoxication. *N Engl J Med* 2006; **355:** 423–4.

Preparations

Proprietary Preparations (details are given in Part 3)

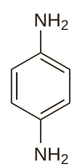
Paraphenylenediamine

Parafenilendiamina. *p*-Phenylenediamine; 1,4-Benzenediamine.
$C_6H_4(NH_2)_2$ = 108.1.
CAS — 106-50-3.



NOTE. Commonly known in the hairdressing trade as *'para'*. 'PPD' is an abbreviation sometimes used for paraphenylenediamine, which should not be confused with tuberculin purified protein derivative (see Tuberculins, p.2405), which is also referred to by the same abbreviation.

Profile

Paraphenylenediamine is widely used in permanent hair colour preparations. However it is a potent contact allergen and EU legislation restricts its concentration in the finished product to a maximum of 6% calculated as free base. Both type I and type II reactions occur and symptoms usually present as dermatitis on the face or hands. More severe reactions can lead to angioedema; anaphylaxis has also been reported. Systemic symptoms similar to those after ingestion (see below) may also occur following absorption through intact skin. For references to hypersensitivity after skin tattoos with henna that was adulterated with paraphenylenediamine, see p.2318.

Application of tints to the eyelashes or eyebrows may produce blepharoconjunctivitis, eye oedema, and eye pain, with progression to facial oedema and dermatitis, lachrymation, photophobia, uveitis, and keratitis in severe cases. Corneal necrosis has led to blindness. In some countries, use of paraphenylenediamine in eyelash or eyebrow tints is not permitted.

Early symptoms after ingestion of paraphenylenediamine are vomiting and abdominal pain. Severe oedema of the face and oropharynx can lead to life-threatening obstruction of the airways. Other symptoms may include hypotension or hypertension, tachycardia, hepatotoxicity, renal failure, metabolic acidosis, methaemoglobinaemia, rhabdomyolysis, tremor, convulsions, and coma; multisystem failure may be fatal.

Some studies have linked hair dyes with mutagenicity and carcinogenicity, although such findings have often been refuted. In Europe, EU legislation carefully controls which substances may be safely used in hair dye products.

Paraphenylenediamine is also used in the textile and photographic industries.

Adverse effects. References.

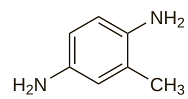
Paratoluenediamine

Paratoluendiamina. 2-Methyl-1,4-phenylenediamine.
$C_7H_{10}N_2$ = 122.2.
CAS — 95-70-5.



Profile

Paratoluenediamine is used in hair colour preparations.

Like paraphenylenediamine, above, paratoluenediamine may be associated with sensitivity reactions.

Parsley

Perejil; Persil; Persil, racine de (parsley root); Petersilie; Petroselini radix (parsley root); Petroselinum; Petrželový kořen (parsley root).

Profile

Parsley (*Petroselinum crispum*, Umbelliferae) is used in herbal medicine, where it is mainly given as a diuretic. It is also used as a culinary herb and flavouring.

Parsley oil has been used in aromatherapy.

Preparations

Proprietary Preparations (details are given in Part 3)
UK: Odo-fre.

Multi-ingredient: ***Arg.:*** Alofresh†; Water Pill c Potasio†; ***Austral.:*** Extralife Fluid-Care; Medinat PMT-Eze†; Odourless Garlic; Uva-Ursi Plus†; ***Canad.:*** Herbal Diuretic; Herbal Throat†; ***Cz.:*** Species Diureticae Planta†; Species Urologicae Planta; Urologicka Cajova Smes; ***Fr.:*** Oropur; ***Ger.:*** Asparagus-P; nephro-loges; ***Malaysia:*** Total Man†; ***Rus.:*** Herbion Urological Drops (Гербион Урологические Капли); ***UK:*** Athera; Fre-bre; Mixed Vegetable Tablets; Modern Herbals Menopause.

Parsley Piert

Alchémille des Champs; Alquimila arvense; Aphanes; Gewöhnlicher Acker-Frauenmantel.

Profile

Parsley piert, the aerial parts of *Aphanes arvensis* (*Alchemilla arvensis*) (Rosaceae) has astringent, diuretic, and demulcent properties. It is used for urinary-tract disorders, including renal and urinary calculi.

Preparations

Proprietary Preparations (details are given in Part 3)

Passion Flower

Golgotavirág hajtásvég; Grenadille; Kärsimyskukka; May-pop; Mučenková nať; Pasiflora; Pasiflorų žolė; Pasionari; Passiflora; Passiflorae herba; Passiflore; Passionsblomma.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Passion Flower). The fragmented or cut, dried aerial parts of *Passiflora incarnata*; it may also contain flowers and/or fruits. It contains not less than 1.5% of total flavonoids expressed as vitexin ($C_{21}H_{20}O_{10}$ = 432.4), calculated with reference to the dried drug. Protect from light.

Profile

Passion flower is reputed to have antispasmodic and sedative properties and has been used as an ingredient of herbal remedies, chiefly in the form of a liquid extract tincture.

Homoeopathy. Passion flower has been used in homoeopathic medicines under the following names: Passiflora incarnata; Passi. in.

Patchouli

Profile

Patchouli (*Pogostemon cablin*, Lamiaceae) is the source of patchouli oil, which is distilled from the dried leaves and young shoots. Patchouli oil is used in aromatherapy.

In traditional Chinese medicine the dried aerial part is known as Guang Huo Xiang.

Homoeopathy. Patchouli oil has been used in homoeopathic medicines.

Patent Blue V

Acid Blue 3; Azul Patente V; CI Food Blue 5; Colour Index No. 42051; E131. Calcium α-(4-diethylaminophenyl)-α-(4-diethyliminiocyclohexa-2,5-dienylidene)-5-hydroxytoluene-2,4-disulphonate.
$(C_{27}H_{31}N_2O_7S_2)_2Ca$ = 1159.4.
CAS — 3536-49-0.

NOTE. The name Patent Blue V is also used as a synonym for Sulphan Blue (CI No. 42045) (see p.2394).

Pharmacopoeias. In *Fr.*

Adverse Effects and Precautions

Hypersensitivity reactions may occur immediately or a few minutes after injection of patent blue V; on rare occasions they may be severe and include shock, dyspnoea, laryngeal spasm, and oedema. Nausea, hypotension, and tremor have been reported.

Giving a small dose to test for hypersensitivity has been suggested.

Hypersensitivity. An urticarial rash occurred in a 5-year-old girl after use of tablets containing patent blue V to disclose the presence of dental plaque.[1] Severe anaphylactic reactions, including shock, have been reported.[2-5]

1. Chadwick BL, *et al.* Allergic reaction to the food dye patent blue. *Br Dent J* 1990; **168:** 386–7.
2. Woltsche-Kahr I, *et al.* Anaphylactic shock following peritumoral injection of patent blue in sentinel lymph node biopsy procedure. *Eur J Surg Oncol* 2000; **26:** 313–14.
3. Adverse Drug Reactions Advisory Committee (ADRAC). Patent blue V and anaphylaxis. *Aust Adverse Drug React Bull* 2002; **21:** 10. Also available at: http://www.tga.health.gov.au/adr/aadrb/aadr0208.htm (accessed 02/07/04)
4. Wöhrl S, *et al.* Near-fatal anaphylaxis to patent blue V. *Br J Dermatol* 2004; **150:** 1037–8.
5. Dewachter P, *et al.* Anaphylactic reaction to patent blue V after sentinel lymph node biopsy. *Acta Anaesthesiol Scand* 2006; **50:** 245–7.

Uses and Administration

Patent blue V is injected subcutaneously to colour the lymph vessels so that they can be injected with a contrast medium. A dose of 0.25 mL of the 2.5% solution diluted with an equal volume of sodium chloride 0.9% or lidocaine hydrochloride 1% injected subcutaneously in each interdigital web space has been used. Additional injections at different sites may be required when the lower limbs are to be examined. A bluish skin colour may develop after injection but usually disappears after 24 to 48 hours.

Patent blue V is used as a food colour.

Malignant neoplasms of the breast. Intradermal injection of patent blue V at the site of a primary breast tumour has been used to identify the associated lymph nodes,[1] but concern has been expressed regarding possible long-term staining of the skin.[2]

2. Giuliano AE. Intradermal blue dye to identify sentinel lymph node in breast cancer. *Lancet* 1997; **350:** 958.

Pegademase *(rINN)*

PEG-ADA; Pegademasa; Pégadémase; Pegademasum; PEG-Adenosine Deaminase.

Пэгадемаза

ATC — L03AX04.
ATC Vet — QL03AX04.

NOTE. Pegademase Bovine is *USAN*.

Profile

Pegademase is a conjugate of adenosine deaminase, an endogenous enzyme that converts adenosine to inosine, with a macrogol (polyethylene glycol). Pegademase bovine is used in the treatment of severe combined immunodeficiency disease (SCID) associated with a deficiency of adenosine deaminase, in patients who are not suitable for bone marrow transplantation or in whom the transplantation has failed. It is given by intramuscular injection once every 7 days, in an initial dose of 10 units/kg; increments of 5 units/kg are then given weekly up to a usual weekly maintenance dose of 20 units/kg. A single dose of 30 units/kg should not be exceeded. Pegademase should be given with caution to patients with thrombocytopenia and avoided if the latter is severe.

USA: Adagen.

Pegaptanib Sodium *(BANM, USAN, rINNM)*

EYE-001; Natrii Pegaptanibum; NX-1838; Pegaptanib Octasodium; Pegaptanib sodico; Pégaptanib Sodique.

Натрий Пегаптаниб

CAS — 222716-86-1.
ATC — S01LA03.
ATC Vet — QS01LA03.

Adverse Effects and Precautions

Endophthalmitis has been reported in patients given pegaptanib sodium and patients should be monitored for signs of infections for a week after the procedure. Retinal haemorrhage, retinal detachment, iatrogenic traumatic cataract, and raised intra-ocular pressure have also been reported. Immediate or delayed intravitreous haemorrhage may occur after injection. Common but less serious ocular adverse effects include eye pain, irritation, inflammation, blurred vision, visual disturbances, corneal oedema, punctate keratitis, and vitreous floaters.

Non-ocular adverse effects that have been reported include headache, rhinorrhoea, bronchitis, diarrhoea, dizziness, nausea, and urinary-tract infections.

Hypersensitivity reactions, including anaphylaxis or anaphylactoid reactions, and angioedema have been reported rarely within several hours of a dose.

Pegaptanib is contra-indicated in patients with active or suspected ocular or periocular infections.

◊ Data from two concurrent international multicentre prospective randomised controlled studies[1] were analysed to assess the safety of pegaptanib after 2 years of treatment for neovascular (wet) age-related macular degeneration. The most common ocular adverse effects were attributed to the injection procedure and were transient and mild to moderate in intensity. Failure to follow the injection preparation protocol accounted for most cases of endophthalmitis. The incidence of adverse effects associated with systemic inhibition of vascular endothelial growth factor or severe ocular inflammation, cataract progression, or glaucoma was not higher in the pegaptanib-treated patients compared with patients receiving sham injections. Overall, the safety profile of pegaptanib was favourable in these studies.

1. D'Amico DJ, *et al.* VEGF Inhibition Study in Ocular Neovascularization (V.I.S.I.O.N.) Clinical Trial Group. Pegaptanib sodium for neovascular age-related macular degeneration: two-year safety results of the two prospective, multicenter, controlled clinical trials. *Ophthalmology* 2006; **113:** 992–1001.

Uses and Administration

Pegaptanib is a pegylated modified oligonucleotide (aptamer) given as the sodium salt in the treatment of neovascular (wet) age-related macular degeneration. It is given by intravitreal injection into the affected eye in a dose of 300 micrograms once every 6 weeks. Stopping or withholding treatment should be considered if there has been no demonstrable benefit after 2 consecutive injections (i.e. at the 12-week visit).

Pegaptanib is also under investigation as an adjunct in the management of diabetic retinopathy.

Age-related macular degeneration. Pegaptanib is a pegylated modified oligonucleotide (aptamer) used in the treatment of age-related macular degeneration (AMD) (p.785). It binds to and inhibits vascular endothelial growth factor (VEGF), which is a stimulant of angiogenesis thought to play a role in the neovascularisation and retinal changes associated with AMD. Pegaptanib is a selective antagonist of VEGF.[1,2]

Positive outcomes have been reported from two concurrent international multicentre prospective randomised controlled studies.[3] Vision loss was prevented and mean visual acuity improved in patients given 6-weekly injections of 300 micrograms, 1 mg, or 3 mg for 48 weeks compared with patients receiving sham injections. No dose-response relationship was found. In order to assess the effects of long-term therapy, patients who had been given pegaptanib in the first part of the study were then randomised at week 54 to receive either pegaptanib for a further 48 weeks or stop treatment, and patients who had been given sham injections were similarly re-randomised.[4] Results showed that patients given pegaptanib for a second year continued to derive additional benefit. A systematic review[5] of 5 randomised controlled studies found that pegaptanib was effective in reducing the risk of loss of visual acuity.

Penicilloyl-polylysine

Benzylpenicilloyl-polylysine; Peniciloil polilisina; PO-PLL; PPL.

CAS — 53608-77-8.

Description. Penicilloyl-polylysine is a polypeptide compound formed by the interaction of a penicillanic acid and polylysine of an average degree of polymerisation of 20 lysine residues per molecule.

Pharmacopoeias. *US* includes a concentrated form.

USP 31 (Benzylpenicilloyl Polylysine Concentrate). It has a molar concentration of benzylpenicilloyl moiety of not less than 0.0125 M and not more than 0.020 M. It contains one or more suitable buffers. It is not intended for direct administration. pH of the concentrate is between 6.5 and 8.5. Store in airtight containers.

Adverse Effects and Precautions

Severe hypersensitivity reactions have occasionally been reported after use of penicilloyl-polylysine; a scratch test is recommended before intradermal use.

Uses and Administration

Penicilloyl-polylysine is used to detect penicillin hypersensitivity. It is generally indicated only for adults with a history of penicillin hypersensitivity. After a preliminary scratch test it may then be given by intradermal injection. The development, usually within 5 to 15 minutes, of a wheal, erythema, and pruritus is generally judged a positive reaction. The incidence of penicillin hypersensitivity is stated to be less than 5% in patients showing a negative reaction. Penicilloyl-polylysine does not detect those liable to suffer late reactions or reactions due to minor antigen determinants; these reactions require other tests. False-positive reactions to penicilloyl-polylysine also occur.

Preparations

USP 31: Benzylpenicilloyl Polylysine Injection.

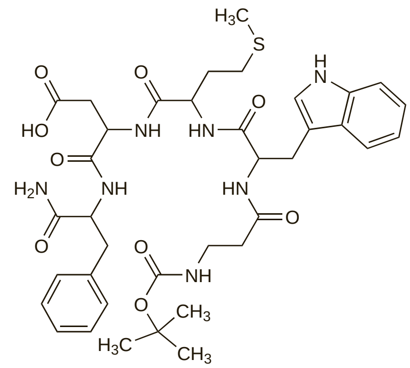
Proprietary Preparations (details are given in Part 3)
USA: Pre-Pen†.

Pentagastrin *(BAN, USAN, rINN)*

AY-6608; ICI-50123; Pentagastriini; Pentagastrina; Pentagastrine; Pentagastrinum. *tert*-Butyloxycarbonyl-[β-Ala[13]]gastrin-(13-17)-pentapeptide amide; Boc-β-Ala-Trp-Met-Asp-Phe—NH_2.

Пентагастрин

$C_{37}H_{49}N_7O_9S$ = 767.9.
CAS — 5534-95-2.
ATC — V04CG04.
ATC Vet — QV04CG04.



Pharmacopoeias. In *Br.* and *Chin.*

BP 2008 (Pentagastrin). A white or almost white powder. Practically insoluble in water; slightly soluble in alcohol; soluble in dimethylformamide and in 5M ammonia. Protect from light.

Adverse Effects

Pentagastrin may cause gastrointestinal effects including nausea and abdominal cramps. Cardiovascular effects including flushing of the skin, tachycardia, and hypotension have occasionally been reported. There may be headache, drowsiness, dizziness, and altered sensations in the extremities. Hypersensitivity reactions are rare.

Precautions

Pentagastrin should be given with care to patients with acute peptic ulceration or with active pancreatic, hepatic, or biliary-tract disease.

Uses and Administration

Pentagastrin is a synthetic pentapeptide that is not active when given by mouth but when given parenterally has effects similar to those of natural gastrin. Since it stimulates the secretion of gastric acid, pepsin, and intrinsic factor, it is used as a diagnostic agent to test the secretory action of the stomach. It has been used to diagnose disorders associated with increased or decreased gastric acid secretion and in the evaluation of gastric acid secretion following vagotomy or gastric resection. The usual dose is 6 micrograms/kg by subcutaneous or intramuscular injection. By intravenous infusion the dose is 600 nanograms/kg per hour, in sodium chloride 0.9%.

Pentagastrin stimulates the secretion of pancreatic enzymes and thus has been used as a test for pancreatic function. It has also been tried in the diagnosis of medullary carcinoma of the thyroid.

Preparations

BP 2008: Pentagastrin Injection.

Proprietary Preparations (details are given in Part 3)
Fr.: Peptavlon.

Black Pepper

Pepper; Pimenta; Piper.

CAS — 8006-82-4 (black pepper oil).

Pharmacopoeias. In *Chin.*, which describes both black and white pepper.

Profile

Black pepper is the dried unripe fruit of *Piper nigrum* (Piperaceae). It is used as a culinary spice and is included in some herbal remedies.

Pepper oil, obtained from black pepper, is used in aromatherapy.

White pepper is the ripe fruit with the outer part of the pericarp removed. It too is used as a culinary spice.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: *Cz.:* Klosterfrau Melisana; ***India:*** Happy'tizer; Tummy Ease; ***Philipp.:*** Bo-D-Fense; ***Pol.:*** Melisana Klosterfrau; ***Rus.:*** Maraslavin (Мараславин); Tentex (Тентекс).

Pepsin

Pepsiini; Pepsiinijauhe; Pepsin práškový; Pepsin, pulver; Pepsina; Pepsine; Pepsini Pulvis; Pepsino milteliai; Pepsinum; Pepszin-por.

CAS — 9001-75-6.

ATC — A09AA03.

ATC Vet — QA09AA03.

Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), and *Viet.* In *Jpn* as Saccharated Pepsin.

Ph. Eur. 6.2 (Pepsin Powder; Pepsin BP 2008). It is prepared from the gastric mucosa of pigs, cattle, or sheep. It contains gastric proteinases active in acid medium (pH 1 to 5). It has an activity of not less than 0.5 Ph. Eur. units/mg, calculated with reference to the dried substance. A hygroscopic, white or slightly yellow, crystalline or amorphous powder. Soluble in water; practically insoluble in alcohol. A solution in water may be slightly opalescent with a weak acidic reaction. Store at 2° to 8° in airtight containers. Protect from light.

Uses and Administration

Pepsin contains proteolytic enzymes secreted by the stomach, which control the degradation of proteins into proteoses and peptones. It hydrolyses polypeptides including those with bonds adjacent to aromatic or dicarboxylic L-amino-acid residues.

Pepsin has been given with dilute hydrochloric acid, or with substances such as glutamic acid hydrochloride, or betaine hydrochloride, as an adjunct in the treatment of gastric hypochlorhydria, or to treat deficiencies of digestive enzyme secretion. It has also been given for its supposed benefit as an ingredient of mixtures for dyspepsia and other gastrointestinal disorders.

Perflubron *(USAN, rINN)* ⊗

Perflubrón; Perflubronum; Perfluorooctylbromide; PFOB. 1-Bromoheptadecafluorooctane.

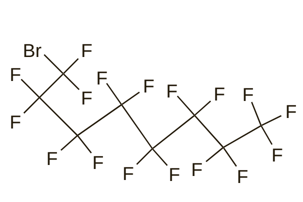
Перфлуброн

C_8BrF_{17} = 499.0.

CAS — 423-55-2.

ATC — V08CX01.

ATC Vet — QV08CX01.



Pharmacopoeias. In *US.*

USP 31 (Perflubron). A clear, colourless, practically odourless liquid. Store in airtight containers. Protect from light.

Profile

Perfluorocarbons can absorb, transport, and release oxygen and carbon dioxide. Perflubron is a perfluorocarbon tried as an alternative to red blood cell preparations to improve gaseous transport, in particular oxygen supply, to the tissues. It may also be instilled directly to the lungs for use in partial liquid ventilation as an adjunct to mechanical ventilation in patients with respiratory failure.

Perflubron is being studied for use as an intravenous contrast medium in computed tomography and ultrasound. It has also been given orally to enhance delineation of the bowel during magnetic resonance imaging.

Other perfluorocarbons have also been used. A mixture of perfluamine (perfluorotripropylamine) and perflunafene (p.2365) has been used to prevent myocardial ischaemia during percutaneous transluminal coronary angioplasty.

Perfluorocarbons such as perflunafene and perfluorooctane (p.2365) have been used in eye surgery.

Blood substitutes. References to the use of perflubron and other perfluorocarbons as oxygen carriers.

Preparations

Proprietary Preparations (details are given in Part 3)

USA: Imagent GI; LiquiVent.

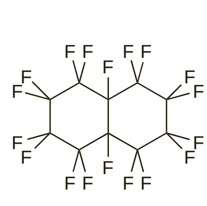
Perflunafene *(BAN, rINN)* ⊗

Perflunafène; Perflunafeno; Perflunafenum; Perfluorodecahydronaphthalene; Perfluorodecalin; Perfluorodekalin.

Перфлунафен

$C_{10}F_{18}$ = 462.1.

CAS — 306-94-5.



Profile

Perflunafene is a perfluorocarbon with similar properties to perflubron (above). Intra-ocular injection of perflunafene is used to provide temporary tamponade in ophthalmic procedures such as retinal re-attachment. Perflunafene and perfluamine have been used together for their oxygen-carrying properties in blood substitute preparations and to prevent myocardial ischaemia during percutaneous transluminal coronary angioplasty.

Preparations

Proprietary Preparations (details are given in Part 3)

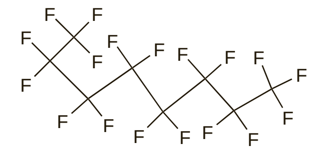
Israel: Adato-Deca†; ***Neth.:*** Eftiar Decalin; ***Turk.:*** DK-Line.

Perfluorooctane

Octadecafluorooctane; Perfluoro-*n*-octane; Perfluoro-octa.

C_8F_{18} = 438.1.

CAS — 307-34-6.



Profile

Perfluorooctane is a perfluorocarbon with similar properties to perflubron (above). Intra-ocular injection of perfluorooctane is used to provide temporary tamponade in ophthalmic procedures such as retinal re-attachment.

Persic Oil

Melocotón, aceite de; Oleum Persicorum; Peach or.

Pharmacopoeias. *Chin.* and *Jpn* include Peach Kernel (Persicae Semen) and also Apricot Kernel (Armeniacae Semen).

Profile

Persic oil is the fixed oil expressed from the kernels of varieties of *Prunus persica* (peach) or *P. armeniaca* (apricot) (Rosaceae). It closely resembles almond oil (p.2252) in its general characteristics and is used as an oily vehicle.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: *Fr.:* Item Lentes.

Peru Balsam

Bals. Peruv.; Bálsamo del Perú; Balsamum peruvianum; Baume du Pérou; Baume du San Salvador; Peru balzamas; Peruánský balzám; Perubalsam; Perui balzsm; Perunpalsami; Peruvian Balsam.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Peru Balsam). The balsam obtained from the scorched and wounded trunk of *Myroxylon balsamum* var. *pereirae*. It contains not less than 45.0% w/w and not more than 70.0% w/w of esters, mainly benzyl benzoate and benzyl cinnamate.

A dark brown, viscous liquid which is not sticky, is non-drying, and does not form threads. It is transparent and yellowish-brown when viewed in a thin layer. Practically insoluble in water, freely soluble in dehydrated alcohol; not miscible with fatty oils except for castor oil. Protect from light.

Profile

Peru balsam has a very mild antiseptic action by virtue of its content of cinnamic and benzoic acids. Diluted with an equal part of castor oil, it has been used as an application to bedsores and chronic ulcers; it has also been used in topical preparations for the treatment of superficial skin lesions and pruritus. It is an ingredient of some rectal preparations used for the symptomatic relief of haemorrhoids (see p.1697).

Peru balsam is an ingredient of some preparations used in the treatment of respiratory congestion. It is also used in aromatherapy.

Skin sensitisation has been reported.

Preparations

Proprietary Preparations (details are given in Part 3)

Pexelizumab *(BAN, USAN, rINN)*

h5G1.1 scFv; h5G1.1 scFv (CDR); Pexélizumab; Pexelizumabum. Immunoglobulin, anti-(human complement C5α-chain)(human-mouse monoclonal 5G1.1-SC chain).

Пекселизумаб

CAS — 219685-93-5.

Profile

Pexelizumab is a recombinant humanised monoclonal antibody that acts as a complement blocker (p.2286) by inhibiting terminal complement activation at the C5 protein. It is under investigation for treatment of patients undergoing coronary artery reperfusion and revascularisation procedures.

◊ References.

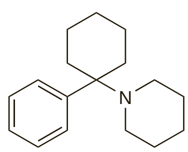
Phencyclidine Hydrochloride *(BANM, USAN, rINNM)*

CI-395; CN-25253-2; GP-121; Hidrocloruro de fenciclidina; NSC-40902; PCP; Phencyclidine, Chlorhydrate de; Phencyclidini Hydrochloridum. 1-(1-Phenylcyclohexyl)piperidine hydrochloride.

Фенциклидина Гидрохлорид

$C_{17}H_{25}N,HCl$ = 279.8.

CAS — 77-10-1 (phencyclidine); 956-90-1 (phencyclidine hydrochloride).



(phencyclidine)

NOTE. The name PCP has also been used as a synonym for pentachlorophenol.

The following terms have been used as 'street names' (see p.vi) or slang names for various forms of phencyclidine:

Ace; AD; Aliamba; Amoeba; Amoebae; Amp; Angel; Angel dust; Angel hair; Angel mist; Angel poke; Animal trank; Animal tranq; Animal tranquilizer; Aurora borealis; Bad pizza; Belladonna; Black dust; Black whack; Blotter acid; Blud madman; Blue madman; Boat; Bohd; Bush; Busy bee; Butt naked; Buzy bee; Cadillac; Cannabinol; Christal; Cigarrode cristal; CJ; Cliffhanger; Cliqum; Columbo; Cozmo's; Crazy coke; Crazy Eddie; Cristal; Crystal; Crystal joint; Crystal T; Crystal TAC; Cycline; Cyclona; Cyclone; Cyclones; Cystal T; D; Detroit pink; Devil's dust; Dipper; Dips; Dirge; Disembalming Fluid; DMT; Do it Jack; DOA; Drink; Drinks; Dummy dust; Dust; Dust joint; Dust of angels; Dusted parsley; Elephant; Elephant trank; Elephant tranquilizer; Embalming fluid; Energizer; Engelenspul; Erth; Fake STP; Fake THC; Fake X; Flakes; Formaldehyde; Fresh; Fry; Fuel; Good; Goon; Goon crystal; Goon dust; Gorilla biscuits; Gorilla pills; Gorilla tab; Green; Green double domes; Green leaves; Green tea; Green tear; Half track; Happy sticks; HCP; Heaven & Hell; Heaven and Hell; Herms; High; Hinkley; Hog; Horse tracks; Horse tranquilizer; Ice; Ill; Illies; Illy momo; Jet fuel; Juice; K; Kaps; K-blast; Killer; Killer joints; Killer weed; KJ; Koller joints; Kools; Kools sherms; Krystal; Krystal joint; Krystal joints; KW; LBJ; Leak; Leakie; Leaky; Leaky bolla; Leaky leak; Lemon 714; Lenos; Lethal weapon; Little ones; Live ones; Log; Love boat; Loveboat; Lovely; Mad dog; Mad man; Madman; Magic; Magic dust; Mean green; Mesk; Mint leaf; Mint weed; Missile; Mist; Monkey dust; Monkey gland; Monkey tranquilizer; More; New acid; New magic; Niebla; Oil; OPP; O.P.P.; Orange crystal; Ozone; P; Parsley; Paz; PCP; PCPA; Peace; PeaCe Pill; Peace pill; Peace pills; Peace weed; Peep; Peter Pan; Pig killer; Pit; Pits; Po-de-anjo; Polvo; Polvo de angel; Polvo de estralos; Polvo de estrellas; Puffy; Purple rain; Red devil; Red devils; Rocket fuel; Rocketfuel; Rupture; Scaffle; Scuffle; Serenity Tranquility Peace; Sernyl; Sernylan; Shabu; Sheets; Sherm; Sherm sticks; Sherman Hemsley; Shermans; Sherms; Skuffle; Smoking; Snorts; Soma; Space rock; Speed boat; Spores; Star dust; Stardust; Stick; STP; Sugar; Super; Super grass; Super joint; Super kools; Super weed; Supergrass; Surfer; Synthetic cocaine; Synthetic THT; T; TAC; Tac et tic; Taking a cruise; T-buzz; Tea; THC; Tic; Tic tac; Tick; Tic-tac; TicTac; Tish; Titch; Trank; Tranq; Tranquilizer (cat, horse, elephant); TT 1; TT 2; TT 3; Venom; Vredestro; Wack; Water; Wave; Weed; Wet; Wet daddies; Wetdaddy; Whack; White horizon; White powder; Wobble weed; Wolf; Woolies; Wooly blunts; Worm; Yellow fever; Zombie; Zombie weed; Zoom; Zoot.

Adverse Effects, Treatment, and Precautions

Phencyclidine can induce a psychosis clinically indistinguishable from schizophrenia. Adverse effects reported include bizarre and violent behaviour, hallucinations, euphoria, agitation, catatonic rigidity, disorientation, incoordination, nystagmus, hypersalivation, vomiting, convulsions, numbness, hypertension, tachycardia, rhabdomyolysis leading to renal failure, acidosis, and, occasionally, malignant hyperthermia. Severe intoxication may result in respiratory depression, coma, and death.

In cases of phencyclidine overdose, activated charcoal should preferably be given within 1 hour of ingestion; multiple doses may be of benefit since phencyclidine is actively secreted into the gastrointestinal tract. Treatment of the adverse effects of phencyclidine is symptomatic; if agitated the patient should be kept quiet in a darkened room, and diazepam given if necessary. Butyrophenone antipsychotics such as haloperidol have been used for severe behavioural problems and psychoses, although they are associated with adverse effects and some suggest that they should generally be avoided. Phenothiazines may lower the seizure threshold and should also be avoided. Hyperthermia should be treated. Renal excretion should be promoted by hydration and use of diuretics if necessary. Acidification of the urine is no longer recommended since acidosis may be exacerbated and renal failure precipitated.

Breast feeding. The American Academy of Pediatrics[1] has stated that, when used as a drug of abuse by a breast-feeding mother, phencyclidine has caused hallucinogenic effects in the infant.

1. American Academy of Pediatrics. The transfer of drugs and other chemicals into human milk. *Pediatrics* 2001; **108:** 776–89. Correction. *ibid.*; 1029. Also available at: http://aappolicy.aappublications.org/cgi/content/full/pediatrics%3b108/3/776 (accessed 02/07/04)

Uses and Administration

Phencyclidine is related chemically to ketamine (see p.1787) and is a potent analgesic and anaesthetic. It was formerly given intravenously to produce an amnesic trance-like state, with analgesia, but severe adverse effects, especially postoperative psychoses, precluded its use. It was formerly used in veterinary medicine as an immobilising agent. Phencyclidine is widely abused in some countries for its hallucinogenic effects and has been taken orally, sniffed, injected, or smoked.

Numerous analogues of phencyclidine have been similarly abused and include:

- PHP (rolicyclidine; 1-(1-phenylcyclohexyl)pyrrolidine)
- PCC (1-piperidinocyclohexanecarbonitrile)
- PCE (*N*-ethyl-1-phenylcyclohexylamine)
- TCP (1-[1-(2-thienyl)cyclohexyl]piperidine)

Phenolsulfonphthalein

Czerwień fenolowa; Fenolisulfoniftaleiini; Fenolsulfonftaleina; Fenolsulfonftalein; Fenolsulfonftaleína; Fenolsulfonftaleinas; Fenolszulfonftalein; Phenol Red; Phénolsulfonephtaléine; Phenolsulfonphthaleinum; Phenolsulphonphthalein *(BAN)*; PSP. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)diphenol *S,S*-dioxide.

$C_{19}H_{14}O_5S$ = 354.4.

CAS — 143-74-8.

ATC — V04CH03.

ATC Vet — QV04CH03.

Pharmacopoeias. In *Chin., Eur.* (see p.vii), and *Jpn.* Also in *USNF.*

Ph. Eur. 6.2 (Phenolsulfonphthalein; Phenolsulphonphthalein BP 2008). A bright to dark red, crystalline powder. Very slightly soluble in water; slightly soluble in alcohol.

USNF 26 (Phenolsulfonphthalein). A bright-red to dark-red, crystalline powder. Very slightly soluble in water; slightly soluble in alcohol.

Profile

Phenolsulfonphthalein has been used as a test of renal function by estimating the rate of urinary excretion after intravenous administration. It has also been given intramuscularly.

Alkaline urine is coloured red to violet.

Phenolsulfonphthalein has also been used as a drug ingestion indicator, a marker in drug absorption studies, and in a test of residual urine.

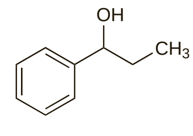
Hypersensitivity reactions to phenolsulfonphthalein may occasionally occur.

Phenylpropanol

Ethyl Phenyl Carbinol; Fenilpropanol; α-Hydroxypropylbenzene; SH-261. 1-Phenylpropan-1-ol; α-Ethylbenzyl alcohol.

$C_9H_{12}O$ = 136.2.

CAS — 93-54-9.



Pharmacopoeias. In *Chin.*

Profile

Phenylpropanol is a choleretic used for the treatment of biliary-tract and gastrointestinal disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austria:*** Hedonin; ***Braz.:*** Quelodin†.

Phloroglucinol *(BAN)*

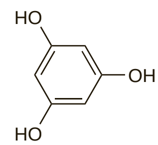
Floroglucinol; Floroglucynol; Floroglusinoli; Phloroglucin; Phloroglucinolum. Benzene-1,3,5-triol.

$C_6H_6O_3$ = 126.1.

CAS — 108-73-6.

ATC — A03AX12.

ATC Vet — QA03AX12.



Pharmacopoeias. In *Eur.* (see p.vii), which also includes the dihydrate.

Ph. Eur. 6.2 (Phloroglucinol, Anhydrous; Phloroglucinolum Anhydricum). A white or almost white powder. Sparingly soluble in water; freely soluble in alcohol; practically insoluble in dichloromethane. A 1% solution in a mixture of alcohol and water has a pH of 4.0 to 6.0. Protect from light.

Ph. Eur. 6.2 (Phloroglucinol Dihydrate; Phloroglucinolum Dihydricum). A white or almost white powder. Sparingly soluble in water; freely soluble in alcohol; practically insoluble in dichloromethane. A 1% solution in a mixture of alcohol and water has a pH of 4.0 to 6.0. Protect from light.

Profile

Phloroglucinol is used as an antispasmodic sometimes in combination with trimethylphloroglucinol. It has been given by mouth, intravenous or intramuscular injection, and rectally.

Preparations

Proprietary Preparations (details are given in Part 3)

Arg.: Pasmovit; ***Fr.:*** Spasfon-Lyoc; Spassirex; ***Ital.:*** Spasmex; ***Mex.:*** Panclasa.

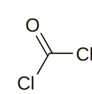
Multi-ingredient: ***Arg.:*** Nero; ***Belg.:*** Spasfon; ***Fr.:*** Meteoxane; Spasfon; ***Gr.:*** Spasfon; ***Ital.:*** Spasmex; ***Mex.:*** Klonaza; Morelax; Panclasa.

Phosgene

Carbonic Dichloride; Carbonyl Chloride; Chloroformyl Chloride; Fosgen; Fosgeno.

$COCl_2$ = 98.92.

CAS — 75-44-5.



Adverse Effects

Poisoning may occur from industrial use or from the generation of phosgene from chlorinated compounds such as dichloromethane, chloroform, or carbon tetrachloride in the presence of heat. Symptoms of poisoning, which may be delayed for up to 24 (rarely 72) hours, include burning of the eyes and throat, cough, dyspnoea, cyanosis, and pulmonary congestion and oedema. Death may result from anoxia. Exposure to 50 ppm may be rapidly fatal. Massive exposure may cause intravascular haemolysis, thrombus formation, and immediate death. Exertional dyspnoea may persist for months after exposure to high concentrations.

Treatment of Adverse Effects

After inhalation of phosgene or absorption from the skin, treatment consists of complete rest and inhalation of oxygen. The mouth, eyes, nose, and skin should be irrigated with copious amounts of water. Oral or parenteral corticosteroids have been used for bronchospasm but the role of inhaled corticosteroids is considered to be controversial. Antibacterials may reduce respiratory infections. Further treatment is symptomatic.

Uses and Administration

Phosgene is used in the chemical industry. It has been used as a war gas.

Phosphatidyl Choline

Fosfatidilcolina; Phosphatidylcholine.

Profile

Phosphatidyl choline is a phospholipid and a constituent of lecithin (p.2332). Phosphatidyl choline is an ingredient of preparations that have been promoted for liver disorders, peripheral vascular disorders, hyperlipidaemias, and fat emboli. Some injection preparations of phosphatidyl choline have been promoted for use in cosmetic surgery to remove subcutaneous fat deposits, but this use is not licensed in the UK.

Ulcerative colitis. Phosphatidyl choline is a component of mucus and plays a key role in mucosal defence. Since a disturbed mucosal barrier is believed to be a factor in the pathogenesis of ulcerative colitis, exogenous phosphatidyl choline has been investigated to improve the protective effects of colonic mucus. Controlled-release oral phosphatidyl choline was beneficial compared with placebo in patients with ulcerative colitis in 2 small short-term studies.[1,2]

Phosphatidyl Serine

Fosfatidilserina; Phosphatidylserine.

Profile

Phosphatidyl serine is a phospholipid that has been tried in the treatment of organic psychiatric syndromes and investigated as a cognition adjuvant. Phosphatidyl serine is a constituent of lecithin (p.2332).

Phosphoserine, which lacks the lipid and glycerol groups of phosphatidyl serine, has been used similarly; both (+)-L-phosphoserine (dexfosfoserine) and the racemic form (DL-phosphoserine) have been used. Phosphoserine has sometimes been used as a synonym for phosphatidyl serine.

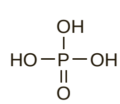
Phosphoric Acid

Acide phosphorique; Acido Fosfórico; Acidum phosphoricum; Concentrated Phosphoric Acid; E338; Fosfato rūgštis; Fosfórico, ácido; Fosforihappo; Fosforsyra; Foszforsav; Kwas fosforowy; Kyselina fosforečná; Orthophosphoric Acid; Phosph. Acid; Phosphorsäure.

H_3PO_4 = 98.00.
CAS — 7664-38-2.



Pharmacopoeias. *Eur.* (see p.vii) includes various concentrations. Also in *USNF.*

Ph. Eur. 6.2 (Phosphoric Acid, Concentrated; Phosphoric Acid BP 2008). It contains 84 to 90% w/w of H_3PO_4. A clear, colourless, corrosive, syrupy liquid. When stored at a low temperature it may solidify, forming a mass of colourless crystals which do not melt until the temperature reaches 28°. Miscible with water and with alcohol. Store in glass containers.

Ph. Eur. 6.2 (Phosphoric Acid, Dilute). It contains 9.5 to 10.5% w/w H_3PO_4 and is prepared by mixing phosphoric acid 115 g with water 885 g.

USNF 26 (Phosphoric Acid). It contains 85 to 88% w/w of H_3PO_4. A colourless, odourless liquid of syrupy consistency. Miscible with water and with alcohol. Store in airtight containers.

USNF 26 (Diluted Phosphoric Acid). It contains 9.5 to 10.5% w/v H_3PO_4 and may be prepared by mixing phosphoric acid 69 mL with purified water to 1000 mL. A clear, colourless, odourless liquid. Store in airtight containers.

Adverse Effects and Treatment

As for Hydrochloric Acid, p.2322.

Toxicity from mixing cleaning agents. For reference to the adverse effects of mixing phosphoric acid-based and hypochlorite-based cleaning agents see Sodium Hypochlorite, p.1661.

Uses and Administration

Phosphoric acid has industrial uses. Dilute phosphoric acid has been used well diluted in preparations intended for the management of nausea and vomiting (p.1700); it has also been included in preparations for vaginal infections. Phosphoric acid is used in dentistry to etch tooth enamel.

Homoeopathy. Phosphoric acid has been used in homoeopathic medicines under the following names: Acidum phosphoricum; Phosphoricum acidum; Ac. phos.

Preparations

USP 31: Sodium Fluoride and Phosphoric Acid Gel.

Proprietary Preparations (details are given in Part 3)
Fr.: Phosoforme†.

Multi-ingredient: ***Arg.:*** Plus & White†; ***Austral.:*** Emetrol†; ***Braz.:*** Paratonico; ***Chile:*** Homeofortin III†; ***Fr.:*** Actiphos†; Biotone†; Ionyl; Marinol; Phosphoneuros; ***Gr.:*** Enter-Out; Kathargon; Mineralin; Phospho-Laxat; Phosphoclean; Trifalac; ***Israel:*** Peptical; ***S.Afr.:*** Emetrol; Emex; ***Spain:*** Oximen; ***Thai.:*** Quinradon-N; ***USA:*** Emetrol; Formula EM; Nausetrol.

Phosphorus

Fósforo; Fósforo amarillo; Fósforo blanco; Phosphor; Phosphore; White Phosphorus; Yellow Phosphorus.

P = 30.973762.
CAS — 7723-14-0.

Handling. Phosphorus has been used for the illicit preparation of explosives or fireworks; care is required with its supply.

Stability and storage. Phosphorus is unstable in air and should be stored under water.

Adverse Effects

Acute poisoning by yellow (white) phosphorus, a general protoplasmic poison, occurs in three distinct stages. The first stage represents local gastrointestinal irritation with intense thirst, pain, nausea, vomiting, and diarrhoea. The vomitus and stool may smell of garlic and are luminescent. Shock, delirium, convulsions, coma, and death may occur. In patients who survive, a second, asymptomatic stage may be present lasting for up to several days or even weeks. The third stage represents systemic toxicity characterised by hepatic and renal damage, cardiovascular collapse, and CNS involvement including confusion, convulsions, and coma. Death may occur during either the first or third stages.

The fatal dose is about 1 mg/kg.

Symptoms of chronic poisoning are associated with defective tissue repair, including necrosis of the mandible ('phossy jaw').

Externally, phosphorus causes severe burns to the skin. Phosphorus is absorbed after skin contamination and systemic symptoms may occur.

Treatment of Adverse Effects

Gastric lavage may be considered after ingestion of elemental yellow (white) phosphorus, although the risks versus potential benefits must be considered in order to prevent spontaneous combustion. Activated charcoal may be used, although there is no clear evidence of benefit. Induction of emesis is contra-indicated. Potassium permanganate solution 1 in 5000 has been instilled into the stomach in an attempt to convert elemental phosphorus to an oxide, but there is no sound clinical reason to recommend this.

Further treatment is symptomatic and supportive and may include fluid and electrolyte replacement, and management of convulsions and renal and hepatic dysfunctions.

Contaminated areas on skin should be immersed in water or irrigated with copious amounts of warm water. Solutions containing copper sulfate have also been suggested for dermal irrigation to convert elemental phosphorus to copper phosphate, although concerns have been raised due to its potential to cause lethal haemolysis through inhibition of G6PD. Eyes contaminated with phosphorus should be irrigated with copious amounts of tepid water for at least 15 minutes. Exposed areas should be covered with wet dressings or compresses to prevent spontaneous combustion. It is essential that all particles of unoxidised phosphorus are removed from the skin. Lipid or oil-based topical preparations may increase the absorption of phosphorus through the skin and should not be used.

Uses and Administration

Elemental phosphorus is no longer used in medicine. Inorganic phosphates are given in deficiency states and bone diseases (see Uses and Administration of Sodium Phosphate, p.1683). Phosphorus has been used in the manufacture of rat and cockroach poisons.

Homoeopathy. Phosphorus has been used in homoeopathic medicines.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Indon.:*** Hyric.

Picibanil

OK-432.

Пицибанил
CAS — 39325-01-4.

Profile

Picibanil is a lyophilised preparation of a low-virulence strain of *Streptococcus pyogenes* inactivated by heating with benzylpenicillin; it is reported to act as an immunomodulator. It has been given by injection in the treatment of malignant neoplasms.

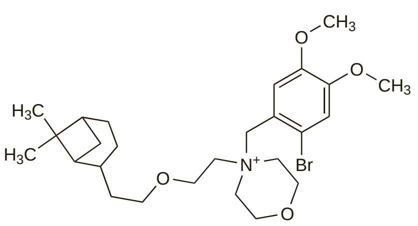
Пинаверия Бромид

$C_{26}H_{41}Br_2NO_4$ = 591.4.
CAS — 59995-65-2 (pinaverium); 53251-94-8 (pinaverium bromide).
ATC — A03AX04.
ATC Vet — QA03AX04.



(pinaverium)

Profile

Pinaverium bromide is a calcium-channel blocker with some antimuscarinic-like effects. It is used for the relief of gastrointestinal spasm in usual doses of 50 mg orally three times daily at mealtimes.

Effects on the gastrointestinal tract. Two patients had heartburn and dysphagia after taking pinaverium bromide orally between meals; endoscopy revealed acute oesophageal ulceration, which healed on stopping treatment.[1] The manufacturer's recommendation to take pinaverium bromide during meals was emphasised.

Maritime Pine

Cluster Pine; Strandkiefer.
CAS — 174882-69-0 (pycnogenol).

Pharmacopoeias. In *USNF.*

USNF 26 (Maritime Pine). It consists of the bark of stems of *Pinus pinaster* (*Pinus maritima*) (Pinaceae). It contains not less than 8.0% and not more than 12.0% of procyanidins, calculated on the dried basis and is intended to be used in the preparation of extracts only and is not for direct human consumption. Store at a temperature of 25°, excursions permitted between 15° and 30°. Protect from moisture.

Profile

The bark of the maritime pine, *Pinus pinaster* (*P. maritima*) (Pinaceae) is a source of flavonoid compounds (p.2304). A mixture of procyanidins extracted from the bark is known as pycnogenol, although the term pycnogenols has also been applied to procyanidin flavonoids in general. Preparations of such bark extracts are promoted for their antioxidant action.

Maritime pine is a source of pine needle oil (see Pine Oil, p.2368). Pine needle oil from maritime pine (Pinus pinaster oil) is included in preparations for minor respiratory-tract disorders and in topical preparations for the relief of musculoskeletal, joint, and soft-tissue disorders. Turpentine oil (p.2406) is distilled from the oleoresin.

Preparations

USP 31: Maritime Pine Extract.

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Arg.:*** Aseptobron; ***Ital.:*** Algorex; Flebil Plus; Flogofort; Signum; ***Philipp.:*** Pynocare 40 Actisome; ***UK:*** Zinopin; ***USA:*** Pycnogenol Plus.

Scots Pine

Pin Sylvestre; Pinus Sylvestris; Scotch pine.

Pharmacopoeias. In *Fr.*

Profile

The sprouts of the Scots pine, *Pinus sylvestris* (Pinaceae), are used in herbal medicine for the treatment of catarrh and in topical preparations for mild muscular pain.

Scots pine is a source of pine sylvestris oil, (see p.2368) and pine needle oil (see Pine Oil, p.2368).

Pine Oil

Profile

Pine oil from unspecified species of pine is included in preparations for the relief of coughs and cold symptoms and in topical preparations for the relief of pain in musculoskeletal, joint, and soft-tissue disorders.

Oils from fresh needles, tips, and boughs of *Pinus nigra*, *P. mugo* var. pumilio, *P. pinaster* (Maritime Pine, p.2368), and *P. sylvestris* (Scots Pine, p.2368) are all described as pine needle oil.

Specific pine oils include Pine Silvestris Oil (p.2368), Pumilio Pine Oil (p.2376), and Pinus pinaster oil.

Preparations

Proprietary Preparations (details are given in Part 3)

Pine Silvestris Oil

Borovicová silice; Fir-wool Oil; Kiefernnadelöl; Olejek sosny zwyczajnej; Oleum Pini Silvestris; Pin sylvestre, huile essentielle de; Pini silvestris aetheroleum; Pini Silvestris Etheroleum; Pini Sylvestris Aetheroleum; Scotch Pine Needle Oil; Scots Pine Needle Oil; Sylvestris Pine Oil.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Pine Sylvestris Oil). An essential oil obtained by steam distillation of the fresh leaves and branches of *Pinus sylvestris*. A suitable antioxidant may be added. A clear, colourless or pale yellow liquid with a characteristic odour. Relative density 0.855 to 0.875. Store in well-filled airtight containers at a temperature not exceeding 25°. Protect from light.

Profile

Pine silvestris oil is obtained from the needles and tips of Scots Pine (p.2368). It is used for catarrh and related disorders of the respiratory tract, often with other volatile substances. It is applied externally for rheumatic disorders and is used in aromatherapy.

P. sylvestris is a source of pine needle oil (see Pine Oil, p.2368).

Preparations

Proprietary Preparations (details are given in Part 3)

Powdered Pituitary (Posterior Lobe)
Hipófisis pulverizada (neurohipófisis); Hypophysis Cerebri Pars Posterior; Hypophysis Sicca; Ipofisi Posteriore; Pituitarium Posterius Pulveratum; Pituitary; Posterior Pituitary.

NOTE. Pituitary Extract (Posterior) is *BAN*.

Pharmacopoeias. In *Chin.*

Profile
Powdered pituitary (posterior lobe) is a preparation from the posterior lobes of mammalian pituitary bodies. It has oxytocic, pressor, antidiuretic, and hyperglycaemic actions and has generally been replaced by compounds or preparations with more specific actions such as oxytocin (p.2015) and desmopressin (p.2185).

It has been included as an ingredient of a number of preparations of combined tissue extracts promoted as tonics or for a variety of non-endocrine disorders. Hypersensitivity reactions, including anaphylaxis, have occasionally been reported.

Plantain
Llantén; Plantain grand.

Pharmacopoeias. *Chin.* and *Jpn.* include the herb and seeds from *Plantago asiatica*. *Chin* also permits *P. depressa*.

Profile
The seeds and leaves of the common or greater plantain (*Plantago major*) are reported to possess diuretic and antihaemorrhagic properties. They are used in herbal preparations.

The Asian plantain (*P. asiatica*) and the depressed plantain (*P. depressa*) are also used in herbal medicine.

The ribwort plantain (*P. lanceolata*) is described on p.2379.

Homoeopathy. Plantain has been used in homoeopathic medicines under the following names: Plantago; Plantago major; Plant. m.

Preparations
Proprietary Preparations (details are given in Part 3)
Multi-ingredient: *Fr.:* Biopause solution intime; Ephydrol; ***Indon.:*** Hyric; Renax; ***Port.:*** Erpecalm; ***Switz.:*** Kernosan Elixir; Pastilles pectorales Demo N; Pectoral N; Tisane pectorale et antitussive; Tisane pectorale pour les enfants.

Plastics
Plásticos.

Pharmacopoeias. Many pharmacopoeias include standards for plastic containers and closures.

Adverse Effects
Plastic materials used in medicine and pharmacy may give rise to adverse effects, either by direct contact of the plastic with tissues or by indirect contact (for example, when a solution stored in a plastic container, such as a disposable syringe, is injected). Adverse effects may also arise among workers through handling the materials or by inhaling fumes during manufacture.

Pure polymeric plastics appear to be of low toxicity, though carcinogenic effects have been produced by some on prolonged implantation. However, some monomers are toxic, as may be substances added during manufacture to impart specific physical properties. These additives include plasticisers added to reduce brittleness, ultraviolet-ray absorbers to prevent degradation by light, and antoxidants and lubricants which are sometimes needed for satisfactory processing. Monomer residues or additives can leach out from the finished plastic materials and have been the main causes of adverse effects. These may include haemolysis of blood cells, thrombosis, hypersensitivity reactions, precancerous changes, and local tissue necrosis. Silicone particles have been shed from dialysis tubing resulting in hypersplenism, pancytopenia, and occasionally in the production of a granulomatous hepatitis.

See also under Vinyl Chloride, p.2414, Methylmethacrylate, p.2343, and Polytef, below.

Pleurisy Root

Asclepia tuberosa; Butterfly Weed.

Profile

The root of *Asclepias tuberosa* (Asclepiadaceae) has traditionally been used for pleurisy and other respiratory-tract disorders.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Broncafect; Verbascum Complex†; ***UK:*** Antibron; Chest Mixture; Horehound and Aniseed Cough Mixture; Vegetable Cough Remover.

Pokeroot

Fitolaca; Poke Root.

Pharmacopoeias. In *Chin.*

Profile

Pokeroot, the root of *Phytolacca decandra* (*P. americana*) (Phytolaccaceae) has emetic, purgative, anti-inflammatory, and anti-infective actions. It has been used for rheumatic and arthritic disorders, and for respiratory-tract infections, but is highly toxic in large doses and is not generally recommended. It has also been used externally for skin disorders.

The related species, *P. dodecandra*, is the source of the molluscicide endod (p.2042).

Homoeopathy. Pokeroot has been used in homoeopathic medicines under the following names: Phytolacca; Phytolacca americana; Phytolacca americana e baccis; Phytolacca e baccis; Phyto.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Chile:*** Homeoplasmina†; ***Fr.:*** Homeoplasmine; ***UK:*** Psorasolv.

Polacrilin Potassium *(USAN, rINNM)*

Kalii Polacrilinum; Polacrilina potásica; Polacriline Potassique; Polacrilinum Kalii.

Калия Полакрилин

CAS — 54182-62-6 (polacrilin); 50602-21-6 (polacrilin).

Pharmacopoeias. In *USNF.*

USNF 26 (Polacrilin Potassium). The potassium salt of a unifunctional low-cross-linked carboxylic cation-exchange resin prepared from methacrylic acid and divinylbenzene. A white to off-white, free-flowing powder. Has a faint odour or is odourless. Insoluble in water and in most liquids.

Profile

Polacrilin potassium is used as a tablet and capsule disintegrant.

Poliglusam *(USAN, rINN)*

Chitosan; Poliglusamum.

Полиглузам

CAS — 9012-76-4.

Poliglusam Hydrochloride *(rINNM)*

Chitosan Hydrochloride; Chitosane, chlorhydrate de; Chitosanhydrochlorid; Chitosani hydrochloridum; Chitozano hidrochloridas; Hidrocloruro de poliglusam; Kitosaanihydrokloridi; Kitosanhydroklorid; Kitozán-hidroklorid; Poliglusam, Chlorhydrate de; Poliglusami Hydrochloridum.

Полиглузама Гидрохлорид

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Chitosan Hydrochloride). The chloride salt of an unbranched binary heteropolysaccharide consisting of the two units *N*-acetyl-D-glucosamine and D-glucosamine, obtained by partial deacetylation of chitin, normally leading to a degree of deacetylation of 70.0 to 95.0%. Chitin is extracted from the shells of shrimp and crab. A white or almost white fine powder. Sparingly soluble in water; practically insoluble in alcohol. A 1% solution in water has a pH of 4.0 to 6.0. Store in airtight containers at a temperature of 2° to 8°. Protect from light.

Profile

Poliglusam is a polysaccharide composed of polymers of glucosamine and *N*-acetylglucosamine produced by partial deacetylation of chitin. It is manufactured commercially by chemical treatment of crustacean shells. Poliglusam is under investigation as a pharmaceutical excipient for formulations including oral dosage forms and gene carrier systems. It has been used as a dietary supplement in preparations for obesity and hypercholesterolaemia.

Pollen and Pollen Extracts

Profile

Preparations containing pollen and pollen extracts from various sources have been used as nutritional supplements and in preparations for urological disorders. They are also used for allergen immunotherapy (p.2251).

◊ In common with other products derived from bees, products containing bee pollen may cause serious adverse reactions. Many plant pollens may contribute to bee pollen, including common allergens such as ragweed pollen. For reference to hypersensitivity reactions with bee products, including bee pollen, see under Royal Jelly, p.2382.

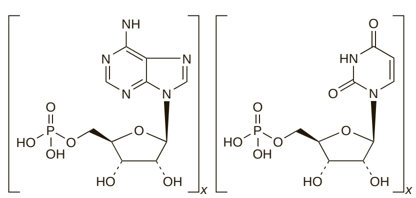
Poly A.poly U

Poli (A). poli (U); Polyadenylic-polyuridylic Acid.

Поли(А).поли(У)

$(C_{10}H_{14}N_5O_7P)x.(C_9H_{13}N_2O_9P)x.$

CAS — 24936-38-7.



adenylic acid (adenosine phosphate) uridylic acid (uridine phosphate)

Profile

Poly A.poly U is a double-stranded polyribonucleotide comprising polyadenylic and polyuridylic acids, and is believed to be an immunostimulant. It has been studied as an adjuvant in the management of operable solid tumours and in the management of hepatitis B. A complex of potassium polyriboadenylate-potassium polyribouridylate is used in the treatment of viral eye infections.

Preparations

Proprietary Preparations (details are given in Part 3)

Rus.: Poludan (Полудан).

Poly I.poly C

Poli (I). poli (C); Polyinosinic-polycytidylic Acid.

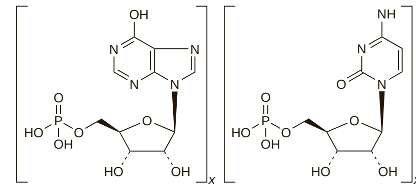
Поли(И).поли(Ц)

$(C_{10}H_{13}N_4O_8P)x.(C_9H_{14}N_3O_8P)x.$

CAS — 24939-03-5.

ATC — L03AX07.

ATC Vet — QL03AX07.



inosinic acid (inosine monophosphate) cytidylic acid (cytidine monophosphate)

Profile

Poly I.poly C is a synthetic double-stranded polyribonucleotide complex of equimolar concentrations of polyinosinic and polycytidylic acids, described as a mismatched double-strand RNA.

Poly I.poly C and the complex of poly I.poly C stabilised with poly-L-lysine in carmellose [poly(ICLC)] have been found to induce the production of interferon and have been investigated in the treatment of malignant neoplasms and viral infections. In the form of poly I.poly C12U (p.902) it has been investigated for the treatment of AIDS, SARS, avian influenza, chronic fatigue syndrome, renal cell carcinoma, and invasive metastatic melanoma; poly(ICLC) has been investigated for the treatment of primary brain tumours.

Polysaccharide-K

Polisacárido-K; PSK; PS-K.

Полисахарид-К

Profile

Polysaccharide-K is a protein-bound polysaccharide isolated from a fungus, *Coriolus versicolor.* It is claimed to have immunostimulant and antineoplastic properties.

Preparations

Proprietary Preparations (details are given in Part 3)

Jpn: Krestin.

Polytef *(USAN)*

Politef *(pINN)*; Politefo; Politefum; PTFE. Poly(tetrafluoroethylene).

Политеф

$(C_2F_4)_n$.

CAS — 9002-84-0.

Profile

Polytef has numerous industrial applications. As 'Teflon' it is used on 'non-stick' cooking utensils.

A paste of polytef has been used for a variety of purposes including the treatment of aphonia, for replacement grafts in vascular surgery, and in the correction of some forms of urinary incontinence (p.2180). The main concern with these procedures is migration of polytef particles. It has also been applied to the skin as a barrier paste with perfluoroalkylpolyether to reduce exposure to chemical warfare agents.

Adverse effects. Brain injury in a child was possibly associated with migration of polytef particles from a periureteral injection performed 1 year earlier.[1] Three cases of polytef adenopathy and one case of giant granuloma have been reported[2] in children who had previously undergone subureteral polytef injection for the treatment of vesicoureteral reflux.

1. Borgatti R, *et al.* Brain injury in a healthy child one year after periureteral injection of Teflon. *Pediatrics* 1996; **98:** 290–1.
2. Aragona F, *et al.* Polytetrafluoroethylene giant granuloma and adenopathy: long-term complications following subureteral polytetrafluoroethylene injection for the treatment of vesicoureteral reflux in children. *J Urol (Baltimore)* 1997; **158:** 1539–42.

Uses. References.

Poplar Buds

Álamo, brotes de; Balm of Gilead Buds.

Pharmacopoeias. *Pol.* includes the leaves from *Populus nigra*.

Profile

The buds of various species of *Populus*, including *P. nigra*, *P. candicans*, *P. gileadensis*, and *P. tacamahacca* (*P. balsamifera*), have been used for the analgesic effect of their salicin content, as well as in preparations for a variety of other disorders. They also contain volatile oil, resin, and other substances. The resin from poplar buds is one of the major sources of propolis (p.2373).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Phytodolor; Valerian†; ***Austria:*** Phytodolor; Prostagutt; ***Braz.:*** Eviprostat†; ***Canad.:*** Bronchial Cough; Mielocol; Wampole Bronchial Cough Syrup†; ***Cz.:*** Homeovox; Phytodolor; ***Ger.:*** Eviprostat N; Phytodolor; Prostamed; ***Indon.:*** Eviprostat; ***Jpn:*** Eviprostat; ***Port.:*** Prostamed†; ***Singapore:*** Eviprostat; ***Switz.:*** Phytomed Prosta†; ***UK:*** Balm of Gilead; Gerard House Reumalex; Peerless Composition Essence; Tabritis.

Poppy-seed Oil

Adormidera, aceite de semilla de; Huile d'Oeillette; Maw Oil; Oleum Papaveris; Oleum Papaveris Seminis.

Profile

Poppy-seed oil is the fixed oil expressed from the ripe seeds of the opium poppy, *Papaver somniferum* (Papaveraceae). It is used as a substitute for olive oil for culinary and pharmaceutical purposes. It is also used in the preparation of Iodised Oil Fluid Injection (BP 2008). Commercial grades are used in making soaps, paints, and varnishes.

Preparations

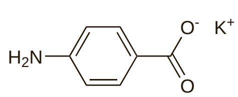
Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Switz.:*** GU Eau†; Olbas.

Potassium Aminobenzoate

Aminobenzoate Potassium; Aminobenzoato potásico. Potassium 4-aminobenzoate.

$C_7H_6KNO_2$ = 175.2.
CAS — 138-84-1.



Pharmacopoeias. In *US.*

USP 31 (Aminobenzoate Potassium). A white crystalline powder. Very soluble in water; soluble in alcohol; practically insoluble in ether. A 1% solution in water has a pH of about 7, while a 5% solution has a pH of 8.0 to 9.0.

Adverse Effects and Precautions

Anorexia, nausea, fever, and skin rash have been reported.

Potassium aminobenzoate should be given with caution to patients with renal impairment. Licensed product information recommends that treatment should be interrupted during periods of fasting, anorexia, or low food intake, to avoid the possible development of hypoglycaemia.

Interactions

Potassium aminobenzoate can inactivate sulfonamides.

Uses and Administration

Potassium aminobenzoate has been used in the treatment of various disorders associated with excessive fibrosis, such as scleroderma (p.1817) and Peyronie's disease, in usual doses of 12 g daily by mouth in 4 to 6 divided doses.

Peyronie's disease. Variable results have been reported with potassium aminobenzoate in the treatment of Peyronie's disease,[1-3] but evidence from well controlled trials is lacking. It has been suggested that a successful response is more likely if treatment is started in the acute stage.[2]

1. Gingell JC, Desai KM. Peyronie's disease. *BMJ* 1988; **298:** 1489–90.
2. Mohanty KC, Strachan RG. Peyronie's disease. *BMJ* 1989; **298:** 254.
3. Carson CC. Potassium para-aminobenzoate for the treatment of Peyronie's disease: is it effective? *Tech Urol* 1997; **3:** 135–9.

Preparations

USP 31: Aminobenzoate Potassium Capsules; Aminobenzoate Potassium for Oral Solution; Aminobenzoate Potassium Tablets.

Proprietary Preparations (details are given in Part 3)
Austria: Potaba; ***Canad.:*** Potaba; ***Ger.:*** Potaba; ***Gr.:*** Potaba; ***UK:*** Potaba; ***USA:*** Potaba.

Potassium Borotartrate

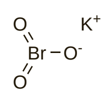
Borotartrato potásico; Potassium Sodium Borotartrate; Soluble Cream of Tartar.
CAS — 12001-68-2.

Profile

Potassium borotartrate is reported to have similar properties to those of bromides (p.2269). It has been used in nervous disorders and has been used in photography as a retarder for alkaline developers. Chronic boron poisoning (see under Boric Acid, p.2268) has been reported following the use of potassium borotartrate internally.

Potassium Bromate

924; Bromato potásico; Potasu bromian.
$KBrO_3$ = 167.0.
CAS — 7758-01-2.



Adverse Effects

Nausea, vomiting, severe abdominal pains, diarrhoea, and lethargy are common after ingestion of potassium bromate. Acute renal failure arising from tubular necrosis usually presents with oliguria or anuria within 1 to 3 days of significant ingestion, and is the most frequent cause of death. Ototoxicity may present as tinnitus or hearing loss within hours of ingestion, and can progress to sensorineural deafness in some patients. Ototoxicity and nephrotoxicity may be irreversible.

Potassium bromate poisoning can also produce hypotension, myocarditis, hepatitis, and encephalopathy characterised by agitation, delirium, convulsions, and coma. Microangiopathic anaemia has also been reported.

Potassium bromate is carcinogenic in *animals.*

Acute toxicity. Reports of bromate poisoning.

1. Lue JN, *et al.* Bromate poisoning from ingestion of professional hair-care neutralizer. *Clin Pharm* 1988; **7:** 66–70.
2. Lichtenberg R, *et al.* Bromate poisoning. *J Pediatr* 1989; **114:** 891–4.
3. De Vriese A, *et al.* Severe acute renal failure due to bromate intoxication: report of a case and discussion of management guidelines based on a review of the literature. *Nephrol Dial Transplant* 1997; **12:** 204–9.

Treatment of Adverse Effects

Gastric lavage should be considered if the patient presents within 1 hour of acute ingestion of potassium bromate; use of a 2 to 5% solution of sodium bicarbonate has been suggested to reduce bromate absorption and prevent hydrobromic acid production. Activated charcoal has also been recommended as an adsorbent. Attention to the patient's fluid, acid–base, and electrolyte status is important, particularly in the presence of acute renal failure. An intravenous infusion of 100 to 500 mL of a 1% sodium thiosulfate solution has sometimes been given. Oxygen may be indicated. The prompt use of haemodialysis or peritoneal dialysis has been suggested.

Thiosulfate. Although the use of intravenous sodium thiosulfate is an accepted practice in the treatment of bromate poisoning, convincing evidence that it reduces bromate to bromide is lacking.[1,2] Oral sodium thiosulfate solutions have also been used but are no longer recommended because hydrogen sulfide, itself a powerful irritant and toxic agent, may be evolved in the presence of hydrochloric acid.[2]

1. McElwee NE, Kearney TE. Sodium thiosulfate unproven as bromate antidote. *Clin Pharm* 1988; **7:** 570–2.
2. De Vriese A, *et al.* Severe acute renal failure due to bromate intoxication: report of a case and discussion of management guidelines based on a review of the literature. *Nephrol Dial Transplant* 1997; **12:** 204–9.

Uses

Potassium bromate is an oxidising agent. It has no therapeutic uses but it has been widely used as the 'neutraliser' of thioglycollate hair-waving lotions. It has been used in the preparation of barley malt for beer. It has also been used as a flour-maturing agent but such use is no longer considered appropriate and is prohibited in some countries.

Food additive. Potassium bromate is a genotoxic carcinogen and should not be present in foods when consumed. Its use for the treatment of flour for bread-making is not appropriate.[1]

1. FAO/WHO. Evaluation of certain food additives and contaminants: forty-fourth report of the joint FAO/WHO expert committee on food additives. *WHO Tech Rep Ser 859* 1995. Also available at: http://whqlibdoc.who.int/trs/WHO_TRS_859.pdf (accessed 18/07/08)

Potassium Chlorate

Clorato potásico; Kalium Chloricum; Potassii Chloras; Potasu chloran.
$KClO_3$ = 122.5.
CAS — 3811-04-9.

Handling and storage. Potassium chlorate is unstable and, in contact with organic or readily oxidisable substances such as charcoal, phosphorus, or sulfur it is liable to explode especially if heated or subjected to friction or percussion. It should not be allowed to come into contact with matches or surfaces containing phosphorus compounds. Reasonable steps should be taken before supplying potassium chlorate to ensure that it will not be used for the illicit preparation of explosives or fireworks.

Profile

Potassium chlorate has been used as an astringent, usually as a mouthwash or gargle. Concentrated solutions are irritant.

Acute poisoning from ingestion requires prompt symptomatic treatment. Symptoms include nausea, vomiting, diarrhoea, abdominal pain, haemolytic anaemia, haemorrhage, methaemoglobinaemia, hyperkalaemia, and renal failure. There may be liver damage and central effects with convulsions and coma.

Gastric lavage should be considered within 1 hour of ingestion of potassium chlorate; activated charcoal is also recommended by some. If methaemoglobinaemia is severe, patients may require exchange transfusion with whole blood. Several authorities consider that methylthioninium chloride should be given intravenously if methaemoglobinaemia is greater than 30%, although some have advised against such use for fear of converting chlorate to the more toxic hypochlorite.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Canad.:*** Fletchers Sore Mouth Medicine; ***Spain:*** Edifaringen; Faringenilo; Solurrinol.

Potassium Hydroxide

Ätzkali; Caustic Potash; E525; Hidróxido potásico; Hydroxid draselný; Kalii hydroxidum; Kalii Hydroxydum; Kalio hidroksidas; Kalium Hydroxydatum; Kálium-hidroxid; Kaliumhydroksidi; Kaliumhydroxid; Potash Lye; Potassium, hydroxyde de; Potasu wodorotlenek.
KOH = 56.11.
CAS — 1310-58-3.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn.* Also in *USNF.*

Ph. Eur. 6.2 (Potassium Hydroxide). White or almost white, crystalline, hard masses, supplied as sticks, pellets, or irregularly shaped pieces; it is deliquescent in air, hygroscopic, and absorbs carbon dioxide. Very soluble in water; freely soluble in alcohol. Store in airtight, nonmetallic containers.

USNF 26 (Potassium Hydroxide). It contains not less than 85% of total alkali, calculated as KOH, including not more than 3.5% of K_2CO_3. White or practically white, fused masses, or small pellets, or flakes, or sticks, or other forms. It is hard and brittle and shows a crystalline fracture. Exposed to air, it rapidly absorbs carbon dioxide and moisture, and deliquesces. Soluble 1 in 1 of water, 1 in 3 of alcohol, and 1 in 2.5 of glycerol; very soluble in boiling alcohol. Store in airtight containers.

Adverse Effects and Treatment

As for Sodium Hydroxide, p.2390.

Uses and Administration

Potassium hydroxide is a powerful caustic that has been used to remove warts. A 2.5% solution in glycerol has been used as a cuticle solvent. An escharotic preparation of potassium hydroxide and calcium hydroxide was known as Vienna paste. Potassium hydroxide is used to adjust the pH of solutions in pharmaceutical formulations.

Preparations

BP 2008: Chloroxylenol Solution; Potassium Hydroxide Solution.

Proprietary Preparations (details are given in Part 3)
Spain: Cerumenol.

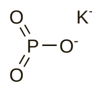
Multi-ingredient: ***Austria:*** Leberinfusion; ***Ger.:*** Acarex†; Glutarsin E†; Kalium-Magnesium-Asparaginat†; Sekudrill†; ***Ital.:*** Sekudrill.

Potassium Metaphosphate

E452 (potassium polyphosphates); Polifosfato potásico; Potassium Kurrol's Salt; Potassium Polymetaphosphate.

$(KPO_3)_x$.

CAS — 7790-53-6.



Pharmacopoeias. In *USNF.*

USNF 26 (Potassium Metaphosphate). A straight-chain polyphosphate, having a high degree of polymerisation. It contains the equivalent of 59 to 61% of P_2O_5. A white, odourless powder. Insoluble in water; soluble in dilute solutions of sodium salts.

Profile

Potassium metaphosphate is used as a buffer.

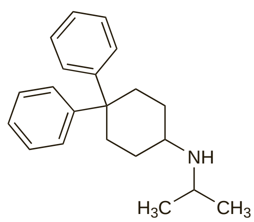
Pramiverine Hydrochloride *(BANM, rINNM)*

EMD-9806 (pramiverine); Hidrocloruro de pramiverina; HSP-2986 (pramiverine); Pramivérine, Chlorhydrate de; Pramiverini Hydrochloridum. *N*-Isopropyl-4,4-diphenylcyclohexylamine hydrochloride.

Прамиверина Гидрохлорид

$C_{21}H_{27}N,HCl = 329.9$.

CAS — 14334-40-8 (pramiverine); 14334-41-9 (pramiverine hydrochloride).



(pramiverine)

Profile

Pramiverine hydrochloride has been used as an antispasmodic.

Preparations

Proprietary Preparations (details are given in Part 3)

Indon.: Systabon; ***Venez.:*** Sistalcin.

Multi-ingredient: *Chile:* Sistalgina†; ***Venez.:*** Sistalcin Compositum.

Pregnancy and Fertility Tests

Pruebas de embarazo y de fertilidad.

Profile

There are a number of kits available for simple pregnancy and fertility testing. A common method of detecting pregnancy is to use specific antibodies to measure the increase in chorionic gonadotrophin in the urine. The period of ovulation can be detected by measuring luteinising hormone excretion in similar ways.

These tests can give false results. Those carrying out the tests should be aware of this and of problems such as contaminated specimens, drug therapy, or other factors that could affect the result.

Preparations

Proprietary Preparations (details are given in Part 3)

Prenylamine *(BAN, USAN, rINN)*

B-436; Hoechst-12512; Prenilamina; Prenylamin; Prénylamine; Prenylaminum; Prenyyliamiini. 2-Benzhydrylethyl(α-methylphenethyl)amine.

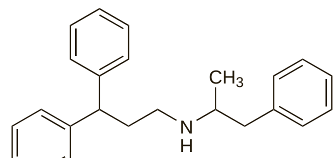
Прениламин

$C_{24}H_{27}N = 329.5$.

CAS — 390-64-7.

ATC — C01DX02.

ATC Vet — QC01DX02.



Prenylamine Lactate *(BANM, rINNM)*

Lactato de prenilamina; Prénylamine, Lactate de; Prenylamini Lactas; Prenylaminii Lactas.

Прениламина Лактат

$C_{24}H_{27}N,C_3H_6O_3 = 419.6$.

CAS — 69-43-2.

ATC — C01DX02.

ATC Vet — QC01DX02.

Profile

Prenylamine depletes myocardial catecholamine stores and has some calcium-channel blocking activity. It was formerly used in the treatment of angina pectoris but has been superseded by less toxic drugs. Use of prenylamine has been associated with the development of ventricular arrhythmias and ECG abnormalities. Tremor and extrapyramidal symptoms have also occurred.

Porphyria. Prenylamine is considered to be unsafe in patients with porphyria because it has been shown to be porphyrinogenic in *in-vitro* systems.

Primula Root

Gullviverot; Kankalingyökér; Kevätesikonjuuri; Primelwurzel; Primevère, racine de; Prímula; Primulae radix; Prvosenkový kořen; Racine de Primevère; Raktažolių šaknys; Schlüsselblumenwurzel.

Pharmacopoeias. *Eur.* (see p.vii) includes Primula root.

Ph. Eur. 6.2 (Primula Root; Primulae Radix). Consists of the whole or cut, dried rhizome and root of *Primula veris* [cowslip] or *P. elatior* [oxlip]. It has a bitter taste. Protect from light.

Profile

Primula root has expectorant properties and is used for cough and other respiratory-tract disorders.

Cowslip, the flowers, leaves, and roots of *Primula veris* (*P. officinalis*) (Primulaceae), is widely used in herbal medicine. The flowers have sedative properties and are used for insomnia, hyperactivity, and anxiety disorders. The flowers and leaves have also been used similarly to primula root.

Oxlip flowers and root (*P. elatior*) and primrose root (*P. vulgaris*) have also been used.

Homoeopathy. Cowslip has been used in homoeopathic medicines under the following names: Primula veris.

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: *Arg.:* Expectosan Hierbas y Miel; ***Austria:*** Bronchithym; Cardiodoron; Heumann's Bronchialtee; Krauter Hustensaft; Sinupret; Solvopret; Thymoval; ***Canad.:*** Original Herb Cough Drops; ***Cz.:*** Biotussil; Bronchialtee N†; Bronchicum Elixir†; Bronchicum Hustensirup†; Bronchicum Sekret-Loser†; Bronchipret; Sinupret; ***Ger.:*** Bronchicum Elixir N†; Bronchicum Elixir Plus†; Bronchicum Elixir S; Bronchicum Sekret-Loser†; Bronchicum Thymian†; Bronchipret; Brust- und Hustentee; Cardiodoron; Dr Scheffler Bergischer Krautertee Husten- und Bronchialtee; Drosithym-N; Equisil N; Expectysat N; Harzer Hustenloser†; Heumann Bronchialtee Solubifix T; JuViton†; Kinder Em-eukal Hustensaft†; Kneipp Husten- und Bronchial-Tee; Phytobronchin; Sinuforton; Sinupret; Tussiflorin forte†; Tussiflorin Hustensaft†; Tussiflorin Hustentropfen†; TUSS-infant N†; ***Hong Kong:*** Pectoral†; Sinupret; ***Hung.:*** Bronchipret; Sinupret; ***Indon.:*** Bronchipret; Silex; Sinupret; ***Mex.:*** Bisolsinus; ***Neth.:*** Bronchicum; ***Philipp.:*** Bronchipret; Sinupret; ***Pol.:*** Bronchicum Eliksir; Bronchosol; Herbapect; Sinupret; ***Rus.:*** Bronchicum (Бронхикум); Bronchicum Husten (Бронхикум Сироп от Кашля); Bronchipret TP (Бронхипрет ТП); Sinupret (Синупрет); ***S.Afr.:*** Bronchicough†; Bronchicum†; Cardiodoron; ***Singapore:*** Sinupret; ***Switz.:*** Cardiodoron†; DemoPectol; Kernosan Elixir; Pectoral N; Perpector†; Sinupret; Sirop pectoral contre la toux S; Sirop S contre la toux et la bronchite; Strath Gouttes contre la toux; Strath Gouttes pour les veines; Strath Gouttes Rhumatisme; Tisane pectorale pour les enfants; ***Thai.:*** Sinupret; Solvopret TP; ***UK:*** Bio-Strath Willow Formula; Onopordon Comp B.

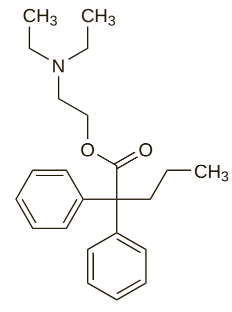
Proadifen Hydrochloride *(USAN, rINNM)*

Hidrocloruro de proadifeno; NSC-39690; Proadifène, Chlorhydrate de; Proadifeni Hydrochloridum; Propyladiphenine Hydrochloride; RP-5171; SKF-525-A. 2-Diethylaminoethyl 2,2-diphenylvalerate hydrochloride.

Проадифена Гидрохлорид

$C_{23}H_{31}NO_2,HCl = 390.0$.

CAS — 302-33-0 (proadifen); 62-68-0 (proadifen hydrochloride).



(proadifen)

Profile

Proadifen has been found to enhance the effects of many drugs, possibly by inhibiting metabolism.

Probiotics

Probiotics are defined as live micro-organisms used as food supplements to improve the health of the host when given in adequate amounts.

Lactic-acid-producing Organisms

Láctico, organismos productores de ácido.

МолочноКислые Бактерии

ATC Vet — QA07FA01.

Profile

Lactic-acid-producing organisms were first introduced as potential therapeutic agents with the idea of acidifying the intestinal contents and thus preventing the growth of putrefactive organisms. *Lactobacillus bulgaricus* (*Lactobacillus delbrueckii* subsp. *bulgaricus*), which occurs in naturally soured milk, was the organism originally used but it can be difficult to obtain growth of this organism in the intestines. Natural yogurt is a common source of lactic-acid-producing organisms.

It is now thought that the gastrointestinal tract may play a wider part in host defences and consequently there is increasing interest in the use of live non-pathogenic microbial cultures to optimise the enteric microbiota, including in neonates. These are referred to as probiotics and are generally commensal lactic-acid producing bacteria, although some yeasts are also used. Organisms currently being used in probiotic preparations include *Lactobacillus* spp. and *Bifidobacterium* spp. Other organisms that may be used are *Enterococcus* and *Streptococcus* spp., and the yeast *Saccharomyces boulardii*.

Probiotics are promoted to restore or maintain a healthy microbial flora, and are widely available as yogurts or other fermented milk products, as well as oral dosage forms such as tablets, capsules, and powders. They are being investigated in the management of several gastrointestinal disorders including diarrhoea and inflammatory bowel disorders. Probiotics are also being investigated in vaginal disorders and allergic disorders such as atopic eczema.

A vaccine produced from strains of lactobacillus found in women with trichomoniasis has been used in the prophylaxis of recurrent trichomoniasis (see p.2241).

Adverse effects. Metabolic acidosis has occurred after use of tablets containing *Lactobacillus acidophilus*.[1] Cases of infection associated with the use of lactic-acid-producing organisms seem to be very rare,[2] although fungaemia associated with the use of *Saccharomyces boulardii*,[3] and sepsis associated with *Lactobacillus* spp.[4] have been reported. Reviews[5,6] on the safety of probiotics concluded that their overall safety record is good. However, the authors recommend caution in certain patient groups such as the elderly and premature or immunocompromised neonates because of occasional reports of sepsis that have rarely occurred in previously healthy patients.[5] Use of enterococci and streptococci as probiotics give a theoretical cause for concern since these genera include pathogenic bacteria.[5] Properties of probiotics are specific to species and strain and therefore reports on safety for one probiotic cannot be generalised to others.[5]

Composition and viability. Some preparations of probiotics have been found to contain smaller quantities or different species of organisms to those specified on the label.[1] An FAO/WHO working group[2] published some guidelines that should be followed in order to claim that a food has a probiotic effect. These include the genus, species, and strain of the organisms in the preparation to be stated on the product label using currently recognised systematic nomenclature, and a statement of the minimum number of viable organisms remaining at the end of the product shelf-life.

Uses. ***ALLERGIC DISORDERS.*** Oral ingestion of probiotic bacteria may play a role in the development of the adaptive immune system[1] and there has been some interest in their use in the management of allergic disorders such as atopic eczema.[2-5] However, reviews[6,7] of studies in allergic disorders have concluded that although there appears to be a reasonable theoretical basis for expecting benefit with probiotics, there are insufficient data to support their inclusion in routine treatment regimens for atopic eczema, perennial allergic rhinitis, or asthma.

GASTROINTESTINAL DISORDERS. Oral probiotics are under investigation for several gastrointestinal disorders and although they appear to be of benefit in some conditions, further study is required to confirm these findings. It is probable that efficacy depends on the species and strain of the organism as well as on the condition being treated.[1,2]

Conclusions from a systematic review[3] suggest that probiotics might be a useful adjunct to oral rehydration therapy in the treatment of acute infectious *diarrhoea* in adults and children. A meta-analysis[4] of studies of *Lactobacillus* therapy in children reached a similar conclusion. However, it was not possible to draw up definitive treatment guidelines because of a lack of standardisation in probiotic regimens, patient groups, or definition of acute diarrhoea between the available studies.[3,4] Meta-analyses[5,6] and a systematic review[7] of studies investigating the use of probiotics in the prevention of antibiotic-associated diarrhoea in adults[5] and children[5-7] also suggest a beneficial effect, although again, further clinical confirmation is required before they can be routinely recommended.[5-7] A review[8] of studies that looked specifically at treatment or prevention of *Clostridium difficile*-associated diarrhoea with the probiotics *Lactobacillus rhamnosus* GG and *Saccharomyces boulardii* concluded that while these specific probiotics might be useful in patients at risk of recurrent *C. difficile* infection, the potential risks of bacteraemia or fungaemia in this particular patient group might outweigh any benefit.

Probiotics have been investigated to correct aberrant intestinal microflora associated with chronic *inflammatory bowel disease* and reviews of such studies suggest some benefit in the prevention and treatment of ulcerative colitis[9-11] and maintenance of remission in pouchitis,[10-12] although the data are not so clear for Crohn's disease.[10,13] Larger controlled clinical studies, again with standardised probiotic preparations and treatment regimens, are necessary to establish the place of probiotics in the management of inflammatory bowel disease.[9-13] Probiotics do not appear to improve abdominal pain in patients with *irritable bowel syndrome* but they may reduce bloating.[14]

Probiotics given to preterm neonates of very low birth-weight reduced the incidence and severity of *necrotising enterocolitis* in 2 randomised controlled studies.[15,16] A systematic review[17] of these and other controlled studies reached the same conclusion, although the authors called for confirmation of these results by a larger study to strengthen the case for routine use of probiotics in preterm neonates.

Probiotics have also been tried in constipation[18] and infantile colic.[19]

UROGENITAL INFECTIONS. Probiotic preparations given orally or intravaginally are under investigation for the prevention or treatment of vaginal infections. Reviews of studies in vulvovaginal candidiasis[1] and bacterial vaginosis[2] concluded that while there was some indication of benefit, larger controlled studies are required to confirm efficacy and the place of probiotics in therapy. A systematic review[3] confirmed that probiotics may be of benefit in the prevention and treatment of bacterial vaginosis in pregnancy but due to insufficient data it was not possible to assess the effect that this might have in preventing preterm labour. A review[4] of studies investigating probiotics for the prevention of urinary-tract infections in women has suggested some benefit.

Promelase *(pINN)*

Promelasa; Promélase; Promelasum; Seaprose S.

Промелаза

CAS — 9074-07-1.

Profile

Promelase is an alkaline protease derived from *Aspergillus melleus*. It has been taken by mouth in doses of 30 to 90 mg daily for its supposed benefit in oedema and inflammation associated with trauma, infection, and surgical procedures.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Altan; Flaminase; Mezen†; ***Port.:*** Onoprose†; ***Thai.:*** Korynase†.

Pronase

Profile

Pronase is a mixture of proteinases obtained from *Streptomyces griseus*.

Preparations

Proprietary Preparations (details are given in Part 3)
Jpn: Empynase.

Propolis

Bee Glue; Propóleo; Própolis.

Прополис

Profile

Propolis is a resinous substance collected by bees, primarily, at least in temperate climates, from poplar buds (see also p.2371) and to a lesser extent from conifers. It is mixed with wax by bees and used in the construction and maintenance of their hives. Propolis is composed of resins, balsams, essential and aromatic oils, and pollen, although the exact proportions of each varies from region to region, bee species, and local flora, therefore making standardisation of propolis for medicinal use difficult. Propolis has been reported to have anti-inflammatory and antimicrobial properties. It has been used as a nutritional supplement and in preparations for coughs, mouth disorders, and skin disorders. It has been used as an ointment for the relief of symptoms of herpes labialis. Propolis has also been used in cosmetics and varnishes.

Hypersensitivity reactions have been reported.

◊ For reference to hypersensitivity reactions with bee products, including propolis, see under Royal Jelly, p.2382.

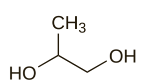
Propylene Glycol

E1520; Glicol Propilênico; Glikol propylenowy; Propilenglicol; Propilénglikol; Propilenglikolis; Propilenoglicol; Propyleeniglykoli; Propylèneglycol; Propylenglycolum; Propylenglykol. (±)-Propane-1,2-diol.

$C_3H_8O_2 = 76.09$.

CAS — 57-55-6 ((±)-propylene glycol); 4254-16-4 ((±)-propylene glycol); 4254-14-2 ((−)-propylene glycol); 4254-15-3 ((+)-propylene glycol).

ATC Vet — QA16QA01.



Pharmacopoeias. In *Chin.*, *Eur.* (see p.vii), *Int.*, *Jpn*, and *US.*

Ph. Eur. 6.2 (Propylene Glycol). A clear, colourless, viscous, hygroscopic liquid. Miscible with water and with alcohol. Store in airtight containers.

USP 31 (Propylene Glycol). A clear, colourless, practically odourless, viscous liquid. It absorbs moisture when exposed to moist air. Miscible with water, with acetone, and with chloroform; soluble in ether; will dissolve in many essential oils but is immiscible with fixed oils. Store in airtight containers.

Adverse Effects and Precautions

Systemic toxicity of propylene glycol is considered to be low after oral doses unless large quantities have been ingested, or when preparations containing propylene glycol are given to neonates or to patients in renal failure. Systemic toxicity is manifested most commonly by CNS depression, especially in neonates and children. Other reported adverse effects include hepatic or renal impairment, intravascular haemolysis, seizures, coma, arrhythmias, and cardiorespiratory arrest. Hyperosmolality has occurred, particularly in small infants and in patients with renal impairment; lactic acidosis may also be a greater problem in the latter group.

After topical use, propylene glycol may produce some local irritation, particularly if applied under occlusive dressings or to mucous membranes; toxicity may occur on application to burns. Hypersensitivity reactions have also been reported. Local sensitivity has been reported after use of ear drops with a propylene glycol vehicle. Injections of preparations containing high concentrations of propylene glycol may produce pain or irritation.

Lactic acidosis. Lactic acidosis developed in a patient with normal renal function given a high-dose continuous lorazepam infusion for which propylene glycol was the principal diluent.[1] Despite temporary resolution of symptoms when the infusion was stopped and bicarbonate given, the patient eventually died. A prospective observational pilot study[2] found propylene glycol to be a common cause of metabolic disturbances in intensive care patients receiving intravenous benzodiazepines, and the authors recommended close monitoring of all such patients.

1. Neale BW, *et al.* Propylene glycol-induced lactic acidosis in a patient with normal renal function: a proposed mechanism and monitoring recommendations. *Ann Pharmacother* 2005; **39:** 1732–6.
2. Wilson KC, *et al.* Propylene glycol toxicity: a severe iatrogenic illness in ICU patients receiving IV benzodiazepines: a case series and prospective, observational pilot study. *Chest* 2005; **128:** 1674–81.

Interactions

Anticoagulants. Propylene glycol has been reported to decrease the effect of *heparin*.[1]

1. Col J, *et al.* Propylene glycol-induced heparin resistance during nitroglycerin infusion. *Am Heart J* 1985; **110:** 171–3.

Pharmacokinetics

Propylene glycol is rapidly absorbed from the gastrointestinal tract. There is evidence of topical absorption when applied to damaged skin.

It is extensively metabolised in the liver primarily by oxidation to lactic and pyruvic acid and is also excreted in the urine unchanged.

◊ References.

Uses and Administration

Propylene glycol is widely used in pharmaceutical manufacturing as a solvent and vehicle, especially for drugs unstable or insoluble in water. It may also be used as a stabiliser in vitamin preparations, as a plasticiser, and as a preservative. Propylene glycol is used extensively in foods and cosmetics.

Propylene glycol has humectant properties and is used similarly to glycerol in topical moisturising preparations.

Propylene glycol is used in veterinary medicine as a glucose precursor.

Prostaglandins

Profile

The prostaglandins, along with thromboxanes and leukotrienes, are all derived from 20-carbon polyunsaturated fatty acids and are collectively termed *eicosanoids*. In man, the most common precursor is arachidonic acid (eicosatetraenoic acid) whereas eicosapentaenoic acid is a predominant precursor in fish and marine animals.

Arachidonic acid is released from cell-membrane phospholipids by the enzyme phospholipase A_2 and is then rapidly metabolised by several enzymes, the major ones being cyclo-oxygenase (prostaglandin synthetase) and lipoxygenase (see Figure 1, below). The prostaglandins, thromboxanes, and prostacyclin (sometimes collectively termed *prostanoids*) all contain ring structures and are products of arachidonic acid oxidation by cyclo-oxygenase, an enzyme with 2 isoforms (COX-1 or COX-2) widely distributed in cell membranes.

The leukotrienes are products of the lipoxygenase pathway; arachidonic acid is metabolised by lipoxygenases to hydroperoxyeicosatetraenoic acids, which are then further metabolised to leukotrienes.

The initial step in the cyclo-oxygenase pathway is the formation of cyclic endoperoxide prostaglandin G_2 (PGG_2) which is then reduced to the endoperoxide prostaglandin H_2 (PGH_2). Prostaglandin H_2 is then converted to the primary prostaglandins prostaglandin D_2, prostaglandin E_2, and prostaglandin $F_{2\alpha}$, to thromboxane A_2 (TXA_2) via the enzyme thromboxane synthetase, or to prostacyclin (PGI_2) via the enzyme prostacyclin synthetase. These products are further metabolised and rapidly inactivated in the body.

The secondary prostaglandins, prostaglandin A_2 (PGA_2), prostaglandin B_2 (PGB_2), and prostaglandin C_2 (PGC_2) are derived from prostaglandin E_2, but are formed during extraction and probably do not occur biologically.

The prostaglandins are all derivatives of the carbon skeleton 7-(2-octilcyclopentyl)heptanoic acid (also known as prostanoic acid). All natural prostaglandins have a double bond at position 1,2 and a hydroxyl group at position 3 of the octil side-chain. Depending on the substitutions on the cyclopentane ring, the main series of prostaglandins are distinguished by the letters A, B, C, D, E, and F; the members of each series are further subdivided by subscript numbers which indicate the degree of unsaturation in the side-chains—hence, those derived from eicosatrienoic acid (dihomo-γ-linolenic acid) have the subscript 1, those derived from arachidonic acid have the subscript 2, and those derived from eicosapentaenoic acid have the subscript 3. In man, only prostaglandins of the '2' series appear to be of physiological importance. Thromboxane A_2 has an oxane rather than a cyclopentane ring; it is chemically unstable and breaks down to thromboxane B_2. Prostacyclin has a double-ring structure and breaks down to 6-keto-prostaglandin $F_{1\alpha}$.

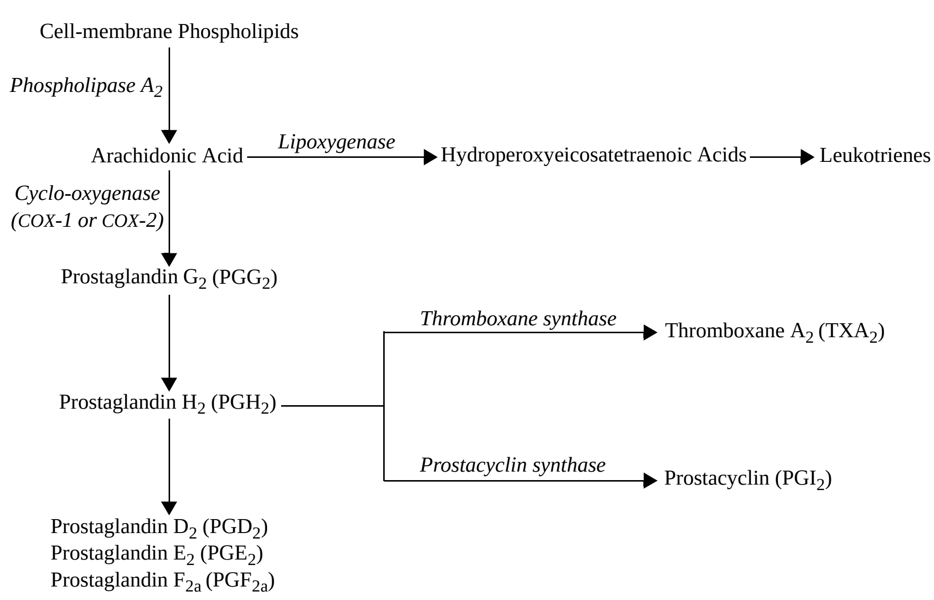
Endogenous prostaglandins are autacoids; they can be formed by virtually all tissues and cells in response to a variety of stimuli, have a wide range of **actions**, and are involved in the regulation of virtually all biological functions. Prostaglandins appear to act through various receptor-mediated mechanisms. Some of their effects are mediated within cells by activation or inhibition of adenylate cyclase and the regulation of cyclic adenosine monophosphate production. At one time prostaglandin E_2 and prostaglandin $F_{2\alpha}$ were thought to be of paramount importance, but with the discovery of thromboxane A_2, prostacyclin, and the leukotrienes it was realised that these primary prostaglandins belong to a large family of physiologically active eicosanoids. Thromboxane A_2 induces platelet aggregation and constricts arterial smooth muscle whereas prostacyclin causes vasodilatation and prevents platelet aggregation; the balance between these opposing actions has an important role in the regulation of intravascular platelet aggregation and thrombus formation. The leukotrienes are important mediators of inflammation.

The pharmacological properties of prostaglandins are wide-ranging and include contraction or relaxation of smooth muscle in the blood vessels, bronchi, uterus, and gastrointestinal tract; inhibition of gastric acid secretion; and effects on platelet aggregation, the endocrine system, and metabolic processes.

Individual prostaglandins vary greatly in their activities and potencies; their actions also depend on the animal species, on the tissues in which they are acting, and on the concentration present, and entirely opposite actions may be elicited with very small structural changes in the molecule.

The diverse **clinical applications** of prostaglandins reflect their wide-ranging physiological and pharmacological properties. Synthetic analogues have been developed with the aim of obtain-

Figure 1. Prostaglandin biosynthesis.



ing compounds that are more stable, have a longer duration of action, and a more specific effect. Applications include:

- softening and dilating the cervix and for uterine stimulation, e.g. dinoprost (prostaglandin F_{2}) (p.2006) and its analogue carboprost (p.2006); dinoprostone (prostaglandin E_2) (p.2007) and its analogue sulprostone (p.2018); and gemeprost (p.2010) and misoprostol (p.2013), analogues of prostaglandin E_1
- vasodilators and inhibitors of platelet aggregation, e.g. alprostadil (prostaglandin E_1) (p.2183) and its analogue limaprost (p.1325); and epoprostenol (prostacyclin) (p.1279) and its analogue iloprost (p.1313)
- inhibition of gastric acid secretion and protection of the gastrointestinal mucosa, e.g. misoprostol (p.2013)
- glaucoma treatment, e.g. bimatoprost (p.1878), latanoprost (p.1882), travoprost (p.1886), and unoprostone (p.1886)
- as luteolytics (causing regression of the corpus luteum in the ovary) in veterinary medicine, e.g. synthetic analogues of prostaglandin F_{2} .

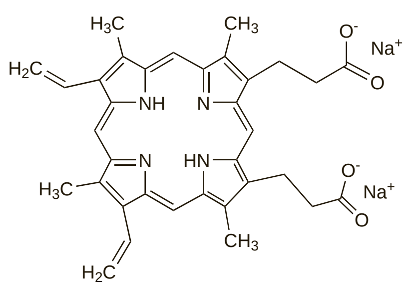
Protoporphyrin IX Disodium

Protoporfirina IX disódica; Protoporphyrin Disodium. Disodium 7,12-diethenyl-3,8,13,17-tetramethyl-21*H*,23*H*-porphine-2,18-dipropanoate.

$C_{34}H_{32}N_4Na_2O_4$ = 606.6.

CAS — 50865-01-5 (protoporphyrin IX disodium); 553-12-8 (protoporphyrin IX).



Profile

Protoporphyrin IX disodium has been given by mouth for the treatment of impaired hepatic function associated with gallstones and cholecystitis.

Proxazole Citrate *(USAN, rINNM)*

AF-634; Citrato de proxazol; Propaxoline Citrate; Proxazole, Citrate de; Proxazoli Citras; PZ-17105. *NN*-Diethyl-3-(1-phenylpropyl)-1,2,4-oxadiazole-5-ethanamine citrate.

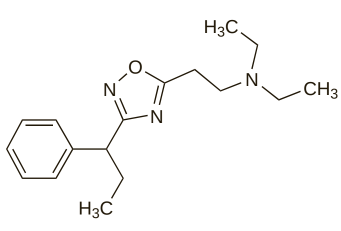
Проксазола Цитрат

$C_{17}H_{25}N_3O,C_6H_8O_7$ = 479.5.

CAS — 5696-09-3 (proxazole); 132-35-4 (proxazole citrate).

ATC — A03AX07.

ATC Vet — QA03AX07.



(proxazole)

Profile

Proxazole citrate has been used as an antispasmodic and in vascular disorders.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Toness†.

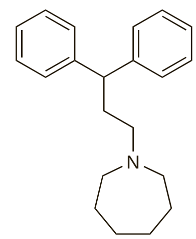
Prozapine Hydrochloride *(rINNM)*

Hexadiphane Hydrochloride; Hidrocloruro de prozapina; Prozapine, Chlorhydrate de; Prozapini Hydrochloridum. 1-(3,3-Diphenylpropyl)cyclohexamethyleneimine hydrochloride.

Прозапина Гидрохлорид

$C_{21}H_{27}N,HCl$ = 329.9.

CAS — 3426-08-2 (prozapine); 13657-24-4 (prozapine hydrochloride).



(prozapine)

Profile

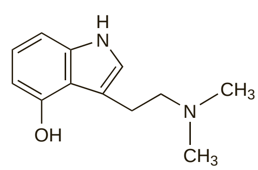
Prozapine hydrochloride is an antispasmodic that has been given orally with sorbitol in biliary and gastrointestinal disorders.

Psilocin

4-Hydroxy-*NN*-dimethyltryptamine; Psilocina; Psilocyn. 3-(2-Dimethylaminoethyl)indol-4-ol.

$C_{12}H_{16}N_2O$ = 204.3.

CAS — 520-53-6.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of psilocin or mushrooms containing psilocin:

1UP's; Abhort; Aborts; Alice; Benzies; Blue Rimmers; Boom-Dads; Boomers; Caps; Crumb Tarts; Cubes; FireWorks; Fun Gus; Fun Guys; Fungus; God's flesh; Goombas; Gus; Jesus; Lalkas; Liberty caps; Little smoke; Magic mushroom; Magic Mushrooms; Marios; Mexican mushroom; Mexican mushrooms; Mucks; Muggers; Mush; Mushies; Mushrooms; Musk; Pizza Toppings; Shroomies; Shrooms; Silly putty; Simple Simon; Smurfhats; Toads; Umbrellas; Yellow Bentines; Zoomers; Zoomies.

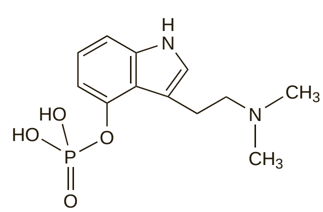
Psilocybine *(BAN, rINN)*

CY-39; 4-Phosphoryloxy-*NN*-dimethyltryptamine; Psilocibina; Psilocybin; Psilocybinum; Psilosybiini. 3-(2-Dimethylaminoethyl)indol-4-yl dihydrogen phosphate.

Псилоцибин

$C_{12}H_{17}N_2O_4P$ = 284.2.

CAS — 520-52-5.



NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of psilocybine or mushrooms containing psilocybine:

1 UP's; Alice; Benzies; Blue caps; Blue Rimmers; Boom-Dads; Boomers; Booms; Buttons; Caps; Champ; Crumb Tarts; Cubes; FireWorks; Fun Gus; Fun Guys; Fungus; Funguys; God's flesh; Goombas; Gus; Hombrecitos; Jesus; Lalkas; Las mujercitas; Little smoke; Magic mushroom; Magic mushrooms; Marios; Mexican mushroom; Mexican mushrooms; Mucks; Muggers; Mush; Mushies; Mushroom soup; Mushroom tea; Mushrooms; Musk; Philosopher's Stones; Pizza toppings; Rooms; Sacre mushroom; Sacred mushroom; Sacred mushrooms; Shroomies; Shrooms; Silly putty; Simple Simon; Smurfhats; Teonanactl; Toads; Truffles; Umbrellas; Yellow Bentines; Zoomers; Zoomies.

Profile

Psilocin and psilocybine are indole alkaloids obtained from the sacred Mexican mushroom (teonanácatl), *Psilocybe mexicana* (Agaricaceae).

In the UK, psilocybine is present in the indigenous mushroom *Psilocybe semilanceata* (magic mushroom; liberty cap). Psilocybine is also present in other species of mushrooms including *Stropharia cubensis* and *Conocybe* spp.

Psilocybine has hallucinogenic and sympathomimetic properties similar to those of lysergide (p.2335). It is less potent than lysergide and its hallucinogenic effects last for up to 6 hours. There is evidence to suggest that psilocybine is converted to the active form psilocin in the body. It has no therapeutic use.

Pulegium Oil

Pennyroyal Oil; Poleo, aceite esencial de.

Profile

Pulegium oil is a volatile oil distilled from pennyroyal herb, *Mentha pulegium* (Labiatae), containing pulegone ($C_{10}H_{16}O$ = 152.2). It was formerly used as an emmenagogue. Severe toxic effects have followed its use as an abortifacient with convulsions, hepatotoxicity, and death. It is reported to have insect repellent activity.

Adverse effects. Severe hepatotoxicity accompanied by seizures occurred in 2 infants each of whom had received herbal teas containing pulegium oil.[1] In one of the infants multiple organ failure developed, and fulminant hepatic failure with hepatocellular necrosis and cerebral oedema proved fatal. A further 4 cases of toxicity associated with ingestion of pulegium oil have been reported;[2] three of the cases were adult patients who had ingested either herbal teas to induce menses (2 cases) or a herbal extract as an abortifacient (1 fatality), and the fourth was a 22-month old child who had ingested the oil.

2. Anderson IB, *et al.* Pennyroyal toxicity: measurement of toxic metabolite levels in two cases and review of the literature. *Ann Intern Med* 1996; **124:** 726–34.

Pulmonary Surfactants

Tensioactivos pulmonares.

Description. Pulmonary surfactants are mixtures consisting mainly of phospholipids and surfactant proteins that are used to replace deficient endogenous lung surfactants. A number of preparations have been studied including:

- natural human surfactant obtained from amniotic fluid or biosynthetic material
- natural animal-derived surfactants, which are bovine or porcine lung extracts that may be modified by the addition of synthetic surfactants, as in the case of beractant, or unmodified, as in the case of bovactant and calfactant
- synthetic or semisynthetic preparations, which may contain the phospholipid colfosceril palmitate, a major constituent of natural lung surfactants, in combination with other substances that aid spreading and absorption such as the synthetic peptide sinapultide.

Beractant *(BAN, USAN)*

A-60386X.

CAS — 108778-82-1.

Description. Beractant is a modified bovine lung extract containing mostly phospholipids, modified by the addition of colfosceril palmitate, palmitic acid, and tripalmitin.

The term Surfactant TA has been applied to a modified bovine lung surfactant.

Bovactant *(BAN)*

SF-R11.

Description. Bovactant is an extract of bovine lung containing about 92% of phospholipids, 3.2% of cholesterol, 0.6% of surfactant-associated hydrophobic proteins, and 0.4% of free fatty acid.

Calfactant *(BAN, USAN)*

CAS — 183325-78-2.

Description. Calfactant is an unmodified calf lung extract that includes mostly phospholipids and hydrophobic surfactant-specific proteins (SP-B and SP-C).

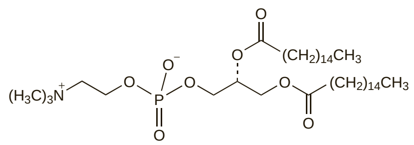
The symbol † denotes a preparation no longer actively marketed

Colfosceril Palmitate *(BAN, USAN, rINN)*

Colfoscéril, Palmitate de; Colfoscerili Palmitas; Dipalmitoylphosphatidylcholine; DPPC; Palmitato de colfoscerilo; 129Y83. 1,2-Dipalmitoyl-*sn*-glycero(3)phosphocholine.

Кольфосцерила Пальмитат

$C_{40}H_{80}NO_8P$ = 734.0.
CAS — 63-89-8.
ATC — R07AA01.
ATC Vet — QR07AA01.



Description. Colfosceril palmitate is a phospholipid which forms an important constituent of natural and many synthetic pulmonary surfactant compounds.

Lucinactant *(USAN)*

ATI-02; KL_4-surfactant.

Description. Lucinactant is a mixture of sinapultide, colfosceril palmitate, sodium palmitoyloleaylphosphatidyl glycerol, and palmitic acid.

Poractant Alfa *(BAN)*

CAS — 129069-19-8.

Description. Poractant alfa is an extract of porcine lung containing not less than 90% of phospholipids, about 1% of hydrophobic proteins (SP-B and SP-C), and about 9% of other lipids.

Pumactant *(BAN)*

Artificial Lung Expanding Compound.

Description. Pumactant is a mixture of colfosceril palmitate and phosphatidyl glycerol (2-oleoyl-1-palmitoyl-*sn*-glycero(3)phospho(1)-*sn*-glycerol) in the proportion 7:3.

Sinapultide *(USAN, rINN)*

ATI-01; Sinapultida; Sinapultidum.

Синапультид

CAS — 138531-07-4.

Description. Sinapultide is a synthetic peptide that mimics the actions of human surfactant protein B, an important constituent of natural pulmonary surfactant compounds.

Adverse Effects and Precautions

Surfactant therapy may be associated with an increased risk of pulmonary haemorrhage, especially in more premature infants. Therapy should only be given where there are adequate facilities for ventilation and monitoring. Rapid chest expansion and improvement of oxygenation may follow successful treatment, and peak ventilatory pressure and inspired oxygen concentration may need to be reduced promptly to avoid the risk of pneumothorax and hyperoxaemia. A transient decrease in brain electrical activity has been reported in neonates given surfactant but its significance is unknown. Transient bradycardia has also been reported. Giving surfactant has occasionally been associated with obstruction of the endotracheal tube by mucus.

◊ While surfactant therapy is clearly associated with an increased risk of pulmonary haemorrhage,[1-4] meta-analysis suggests that the risk is small compared with the benefits.[1] However, neonates who do develop moderate or severe pulmonary haemorrhage after surfactant therapy are at increased risk of death or short-term morbidity.[5] Haemodynamic changes associated with surfactant therapy or consequent pulmonary haemorrhage may also predispose premature infants to intracranial (periventricular) haemorrhage.[5,6] Early preventive use of surfactant in very low birthweight infants may be associated with a poorer neurodevelopmental outcome,[7] although a long-term follow-up study[8] of premature infants born in the surfactant era concluded that these children had similar neurodevelopmental outcomes to such children born before the introduction of surfactant therapy. Decreased brain electrical activity has been reported after surfactant treatment.[9]

The rate of instillation of surfactant may be significant: one study,[10] in which the apparatus was adapted so that mechanical ventilation could continue while giving surfactant, found that rapid instillation over a 5-minute period provoked a transient increase in cerebral blood flow velocity associated with an increase in carbon dioxide tension, compared with slow instillation over 15 minutes. Although the authors acknowledged that such changes were likely to be related to several factors, particularly the type of surfactant, they recommended that, until further data were available, instillation should take place slowly, over at least 15 to 20 minutes.

Uses and Administration

Pulmonary surfactants are compounds with surface active properties similar to those natural substances in the lung that help to maintain the patency of the airways by reducing the surface tension of pulmonary fluids. Exogenous pulmonary surfactants are used in the treatment of neonatal respiratory distress syndrome (p.1508) in premature infants, and may also be given for prevention in infants considered to be at risk of developing the syndrome. Doses vary, but most pulmonary surfactants are given in recommended doses of 100 to 200 mg phospholipids per kg birth-weight; a suggested dose for colfosceril palmitate is 67.5 mg/kg. For the treatment of overt neonatal respiratory distress syndrome, the initial dose is given as soon as possible after diagnosis, while for prevention it is given as soon as possible after birth. It is given as a suspension via an endotracheal tube to intubated neonates receiving mechanical ventilation. Manufacturers may recommend regimens with or without disconnection from the ventilator. Repeat doses may be given if necessary, although the number of doses and the dosage interval varies.

Pulmonary surfactants have also been tried in bronchopulmonary dysplasia in premature infants, meconium aspiration syndrome in newborn infants, and acute respiratory distress syndrome in adults. A similar compound lusupultide is also under investigation for aspiration pneumonitis.

Acute respiratory distress syndrome. Pulmonary surfactants have been investigated for acute respiratory distress syndrome (p.1498). In adults, they have been given by intrabronchial instillation[1] or nebulisation[2-4] but results have been largely disappointing. Sequential bronchopulmonary segmental lavage with a synthetic surfactant has also been tried[5] and appeared to be well tolerated. Endotracheal poractant alfa moderately improved oxygenation in some children with severe acute respiratory distress syndrome secondary to pulmonary or systemic disease.[6]

1. McBrien M, *et al.* Artificial surfactant in the treatment of near drowning. *Lancet* 1993; **342:** 1485–6.

Meconium aspiration syndrome. Meconium aspiration syndrome produces respiratory distress in infants born at term or later and is a consequence of disturbances of the pulmonary surfactant system. Bolus doses of exogenous pulmonary surfactant are of benefit in some ventilated infants, although lung lavage with dilute surfactant is also under investigation.[1] Results from a pilot study[2] of beractant as a tracheobronchial lavage fluid for the treatment of infants with severe meconium aspiration syndrome were promising, and a small comparative trial[3] found that bronchoalveolar lavage with diluted beractant, with or without intravenous dexamethasone, significantly improved oxygenation in neonates when compared with standard therapy. Systematic review[4] of 4 randomised controlled trials evaluating the effect of pulmonary surfactants also found encouraging results, although comparison with other established treatments for meconium aspiration syndrome remains to be done.

Pulsatilla

Anémone pulsatille; Meadow Anemone; Pasque Flower.
CAS — 62887-80-3.

Profile

Pulsatilla is the whole flowering plant of *Pulsatilla vulgaris* (*Anemone pulsatilla*) or *Pulsatilla pratensis* (Ranunculaceae). It has been used in herbal preparations for the treatment of conditions including nervous disorders, circulatory disorders, and gynaecological disorders and benign prostatic hyperplasia.

Homoeopathy. Pulsatilla has been used in homoeopathic medicines under the following names: Pulsatilla pratensis; Pulsatilla vulgaris; Pulsatilla nigricans; Puls.

Preparations

Proprietary Preparations (details are given in Part 3)
USA: Yeast-X†.

Pumilio Pine Oil

Dwarf Pine Needle Oil; Dwarf Pine Oil; Essence de Pin de Montagne; Latschenöl; Oleum Pini Pumilionis; Olio di Mugo; Pin de montagne, huile essentielle de; Pini pumilionis aetheroleum; Pino mugo, aceite esencial de.
CAS — 8016-46-4.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Dwarf Pine Oil). An essential oil obtained by steam distillation of the fresh leaves and twigs of *Pinus mugo*. A suitable antioxidant may be added. Relative density 0.857 to 0.868. A clear, colourless or pale yellow liquid. Store in inert, well-filled, airtight containers at a temperature not exceeding 25°. Protect from light.

Profile

Pumilio pine oil is a volatile oil obtained by distillation from the fresh leaves of *Pinus mugo* var. *pumilio* (Pinaceae). It has been inhaled with steam, sometimes with other essential oils, to relieve cough and nasal congestion and has been applied externally as a rubefacient. It has also been used as a perfume.

P. mugo is a source of pine needle oil (see Pine Oil, p.2368).

Preparations

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: ***Austral.:*** Biosal Arthritis; Biosal†; Goanna Heat Cream; Goanna Salve; Karvol†; Menalation†; Vicks Inhaler; ***Austria:*** Berggeist; Bronchostop; Colda; Emser Nasensalbe; Erkaltungsbalsam; Expectal-Balsam; Leukona-Rheuma-Bad; Luuf Balsam; Mentopin; Nasanal; Opino; Piniment; ***Cz.:*** Thrombocid; Transpulmin; ***Ger.:*** Aerosol Spitzner N†; Dolo-cyl; Em-eukal†; Emser Nasensalbe N†; Euflux; Franzbranntwein; Hevertopect N†; Klosterfrau Franzbranntwein Latschenkiefer; Nasentropfen-ratiopharm†; Ner-fluid S; polio-elan; Rosarthron†; Thrombocid; ***Gr.:*** Opino-jel; ***Irl.:*** Karvol; ***Israel:*** Karvol; Mentholatum Balm; ***Ital.:*** Altuss; Antipulmina†; Broncosedina; Pinedrin†; Pumilene Vapo; ***Malaysia:*** Purporent†; ***Neth.:*** Luuf Verkoudheidsbalsem; ***NZ:*** Vicks Inhaler; ***Port.:*** Thrombocid; ***Switz.:*** Eau-de-vie de France avec huile de pin nain du Tirol†; Eucapinol; Liberol Baby N; Liberol Bain†; Liberol N; Makaphyt Baume†; Pinimenthol†; Piniol Pommade Speciale†; Thrombocid; ***UK:*** Allens Pine & Honey; Karvol; Mentholatum Rub; Original Cabdrivers Expectorant; Potter's Catarrh Pastilles.

Punarnava

Punarnaba.

Profile

Punarnava is the fresh or dried plant *Boerhaavia diffusa* (*B. repens*) (Nyctaginaceae), containing an alkaloid, punarnavine. It has been used as a diuretic and for liver disorders, usually in the form of a liquid extract.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: ***Rus.:*** Dipana (Дипана).

Pyricarbate *(rINN)*

Piricarbato; Pyricarbatum; Pyridinolcarbamate. 2,6-Pyridinediyldimethylene bis(methylcarbamate).

Пирикарбат

$C_{11}H_{15}N_3O_4$ = 253.3.
CAS — 1882-26-4.

Profile

Pyricarbate has been given by mouth in the treatment of atherosclerosis and other vascular disorders, hyperlipidaemias, and thromboembolic disorders. Adverse effects have included gastrointestinal disturbances and liver damage.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Cicloven; ***Port.:*** Anginin†.

Quassia

Bitter Wood; Cuasia; Leño de Cuasia; Quassia Wood; Quassiae Lignum; Quassiaholz.

CAS — 76-78-8 (quassin); 76-77-7 (neoquassin).
ATC — P03AX04.
ATC Vet — QP53AX03.

Profile

Quassia is the dried stem wood of Jamaica quassia, *Picrasma excelsa* (*Aeschrion excelsa; Picraena excelsa*) (Simaroubaceae), or of Surinam quassia, *Quassia amara* (Simaroubaceae). It has been used as a bitter. It was formerly given as an enema for the expulsion of threadworms and was applied for pediculosis. It may also be used as a flavour in food, drinks, and confectionery. Extracts of quassia or preparations containing its triterpenoid bitter principle quassin are used to denature alcohol.

Preparations

Proprietary Preparations (details are given in Part 3)
Arg.: Cuassicum Prevent 2 en 1; Picutex.

Multi-ingredient: ***Arg.:*** Aulo Repelente De Piojos; Cuassicum; Fuera Bicho; Uze Active; Yalu†; ***Braz.:*** Camomila; ***Fr.:*** Quintonine; Skin Nail; ***Ital.:*** Dekar 2; ***S.Afr.:*** Essens Amara of Groen Amara; Versterkdruppels; ***Switz.:*** Stomacine; ***UK:*** Sanderson's Throat Specific.

Quebracho

Quebracho Blanco; White Quebracho.

Квебрахо Белое

NOTE. Do not confuse with trees belonging to the genus *Schinopsis* that may also be referred to as quebracho.

Profile

The bark of white quebracho, *Aspidosperma quebracho-blanco* (Apocynaceae) is used in herbal medicine for the treatment of respiratory disorders. It has also been used to reduce fever, as an antihypertensive, and as a flavouring agent.

Preparations

Proprietary Preparations (details are given in Part 3)

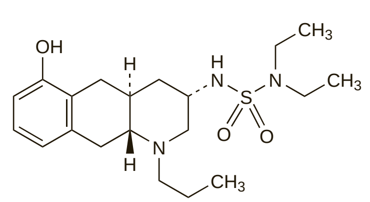
Multi-ingredient: ***Cz.:*** Afrodor; Bronchicum Elixir†; Bronchicum Tropfen†; ***Ger.:*** Afrodor; Bronchicum Elixir N†; Bronchicum Tropfen N†; ***Hung.:*** Afrodor†; ***Pol.:*** Bronchicum Eliksir; Bronchicum†; ***Rus.:*** Afrodor (Афродор); Bronchicum (Бронхикум); ***S.Afr.:*** Bronchicough†; Bronchicum†; ***Spain:*** Broncovital†.

Quinagolide Hydrochloride *(BANM, rINNM)*

CV-205-502 (quinagolide); Hidrocloruro de quinagolida; Quinagolide, Chlorhydrate de; Quinagolidi Hydrochloridum; SD2-CV-205-502 (quinagolide). (±)-*N*,*N*-Diethyl-*N*′-[(3*R**,4a*R**,10a*S**)-1,2,3,4,4a,5,10,10a-octahydro-6-hydroxy-1-propylbenzo[*g*]quinolin-3-yl]sulfamide hydrochloride.

Хинаголида Гидрохлорид

$C_{20}H_{33}N_3O_3S,HCl$ = 432.0.
CAS — 87056-78-8 (quinagolide); 94424-50-7 (quinagolide hydrochloride).
ATC — G02CB04.
ATC Vet — QG02CB04.



(quinagolide)

Adverse Effects and Precautions

As for Bromocriptine, p.798, although it is not an ergot derivative and does not seem to be associated with fibrotic reactions or vasoconstriction. Licensed product information contra-indicates the use of quinagolide in patients with hepatic or renal impairment; however, this is based on a lack of data in such patients.

Effects on mental function. For reports of daytime somnolence occurring in patients receiving dopamine agonists including quinagolide, see Effects on Mental Function, under Adverse Effects of Levodopa, p.805.

Interactions

As for Bromocriptine, p.800.

Pharmacokinetics

Quinagolide is rapidly absorbed from the gastrointestinal tract and undergoes extensive first-pass metabolism to the *N*-desethyl analogue which is biologically active and the *N*,*N*-didesethyl analogue. Roughly equal amounts of a dose appear in the urine and the faeces; it is excreted in the urine as sulfate or glucuronide conjugates of quinagolide and its metabolites and in the faeces as the unconjugated forms. Protein binding has been reported to be about 90%. The elimination half-life of quinagolide at steady state is about 17 hours.

Uses and Administration

Quinagolide is a non-ergot dopamine D_2-agonist that has actions and uses similar to those of bromocriptine (p.800). It is used in the treatment of disorders associated with hyperprolactinaemia.

Quinagolide is given as the hydrochloride, but doses are described in terms of the base; 27.3 micrograms of quinagolide hydrochloride is equivalent to about 25 micrograms of quinagolide. The initial dose, given once daily with food at bedtime, is 25 micrograms daily for 3 days. Doses are increased thereafter at 3-day intervals in steps of 25 micrograms until the optimal response is achieved, which is usually within the range of 75 to 150 micrograms daily. If doses greater than 300 micrograms daily are required, the daily dosage may be increased in steps of 75 to 150 micrograms at intervals of not less than 4 weeks.

Quinagolide has also been investigated in the treatment of acromegaly and lactation inhibition.

Acromegaly. Dopaminergics can produce a paradoxical reduction in growth hormone secretion and may be used in the treatment of acromegaly as adjunctive therapy to surgery, radiotherapy, or somatostatin analogues to reduce circulating growth hormone levels, although they are less effective than somatostatin analogues (p.1798). Bromocriptine has been the main dopamine agonist used, but quinagolide has been tried and results of an open study[1] in which quinagolide was given to 17 patients with acromegaly suggest that quinagolide has a more prolonged effect on suppression of growth hormone secretion than bromocriptine. However, it was ineffective in bromocriptine-resistant patients. In another study involving 34 patients, quinagolide was more effective than either cabergoline or a depot preparation of bromocriptine in normalising circulating growth hormone and insulin-like growth factor.[2]

Quinine and Urea Hydrochloride

Carbamidated Quinine Dihydrochloride; Chininum Dihydrochloricum Carbamidatum; Quinina y urea, hidrocloruro de; Urea-Quinine.

$C_{20}H_{24}N_2O_2,CH_4N_2O,2HCl,5H_2O$ = 547.5.
CAS — 549-52-0 (anhydrous quinine and urea hydrochloride).

Profile

Quinine and urea hydrochloride has been used for the treatment of haemorrhoidal bleeding and anal fissure. It was formerly used as a local anaesthetic and for the therapeutic actions of quinine.

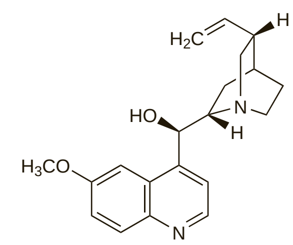
Preparations

Proprietary Preparations (details are given in Part 3)
Fr.: Kinurea H.

Quinine Ascorbate *(USAN)*

Quinina, ascorbato de; Quinine Biascorbate.

$C_{20}H_{24}N_2O_2,2C_6H_8O_6$ = 676.7.
CAS — 146-40-7.



(quinine)

Profile

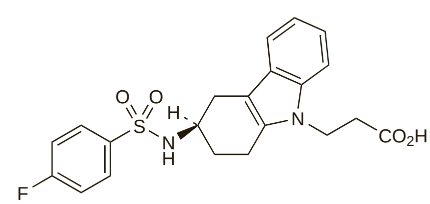
Quinine ascorbate is a compound (2 : 1) of ascorbic acid with quinine. It has been used as an ingredient of preparations promoted as smoking deterrents.

Ramatroban *(BAN, rINN)*

BAY-U-3405; EN-137774; Ramatrobán; Ramatrobanum. (*R*)-3-[3-(4-Fluorophenylsulphonylamino)-1,2,3,4-tetrahydrocarbazol-9-yl]propionic acid.

Раматробан

$C_{21}H_{21}FN_2O_4S$ = 416.5.
CAS — 116649-85-5.



Profile

Ramatroban is a thromboxane A_2 inhibitor that has been used for the treatment of allergic rhinitis.

Preparations

Proprietary Preparations (details are given in Part 3)
Jpn: Baynas.

Ranibizumab *(BAN, USAN, rINN)*

Ranibizumabum; rhuFab V2. Immunoglobulin G1, anti-(human vascular endothelial growth factor) Fab fragment (human-mouse monoclonal rhuFAB V2 γ1-chain), disulfide with human-mouse monoclonal rhuFAB V2 κ-chain.

Ранибицумаб

CAS — 347396-82-1.
ATC — S01LA04.
ATC Vet — QS01LA04.

Adverse Effects and Precautions

Intra-ocular inflammation and raised intra-ocular pressure may occur with ranibizumab. Adverse effects relating to the injection procedure include endophthalmitis, rhegmatogenous retinal detachment, retinal tear, and iatrogenic traumatic cataract. Patients should be monitored for signs of infections for a week after the procedure. Common but less serious ocular adverse effects include red eye, eye pain, vitreous floaters, eye irritation, increased lachrymation, and the sensation of a foreign body in the eye.

Non-ocular adverse effects that have been reported include headache, nausea, arthralgia, back pain, bronchitis, anaemia, and hypertension. Arterial thromboembolic events are a theoretical possibility with vascular endothelial growth factor inhibitors.

Ranibizumab is contra-indicated in patients with active or suspected ocular or periocular infections, or active severe intra-ocular inflammation.

Stroke. The manufacturers of ranibizumab have reported that interim analysis of results from an ongoing study have revealed a higher incidence of stroke in a group of patients given doses of 500 micrograms compared with a group receiving 300 micrograms. Patients with a history of stroke appeared to be at greater risk.

Uses and Administration

Ranibizumab is a recombinant humanised monoclonal antibody used in the treatment of neovascular (wet) age-related macular degeneration. It is given by intravitreal injection into the affected eye in doses of 500 micrograms once a month initially for 3 to 4 months. In the UK, after the first 3 months, maintenance treatment is based on regular assessment of visual acuity, with ranibizumab being given if the patient had a loss of greater than 5 letters in visual acuity; the interval between consecutive doses should be at least one month. In the USA, if monthly administration is not feasible after the first four injections, treatment may be given once every 3 months, although this is not as effective as monthly doses.

Age-related macular degeneration. Ranibizumab is a recombinant humanised monoclonal antibody fragment related to bevacizumab (p.684) used in the treatment of (wet) age-related macular degeneration (AMD) (p.785). It binds to and inhibits vascular endothelial growth factor A (VEGF-A), which is a stimulant of angiogenesis thought to play a role in the neovascularisation and retinal changes associated with AMD. Ranibizumab inhibits all active forms of VEGF-A.[1]

Positive outcomes have been reported from two international multicentre randomised controlled phase III studies.[2,3] Vision loss was prevented and mean visual acuity improved in patients given either monthly injections of 300 micrograms or 500 micrograms for 2 years compared with patients receiving sham injections.[2] Ranibizumab given in the same doses was also shown to be superior to photodynamic therapy with verteporfin at 1 year in the second study.[3]

A review[4] of interim results of other ongoing phase III studies of ranibizumab for AMD suggests that reducing the dosing interval to once every 3 months is less satisfactory than monthly injections, although tailoring the treatment to morphological parameters was as effective at 1 year as giving a fixed dosage regimen. However, ranibizumab in combination with photodynamic therapy does not necessarily result in better visual acuity outcomes and may even be worse than ranibizumab alone. A systematic review[5] of 5 randomised controlled studies found that ranibizumab was effective in reducing the risk of loss of visual acuity, and also improved visual acuity in a significant proportion of eyes.

Preparations

Proprietary Preparations (details are given in Part 3)
Austral.: Lucentis; ***Cz.:*** Lucentis; ***Fr.:*** Lucentis; ***Gr.:*** Lucentis; ***Indon.:*** Lucentis; ***Malaysia:*** Lucentis; ***Port.:*** Lucentis; ***UK:*** Lucentis; ***USA:*** Lucentis.

Rapeseed Oil

Colza, aceite de; Colza, huile de; Colza Oil; Olej rzepakowy; Oleum Rapae; Rapae oleum; Rape Oil; Rapsolja; Rapsų aliejus; Repceolaj; Řepkový olej; Rypsiöljy.

Pharmacopoeias. In *Eur.* (see p.vii) and *Jpn. USNF* includes fully hydrogenated rapeseed oil and superglycerinated fully hydrogenated rapeseed oil.

Ph. Eur. 6.2 (Rapeseed Oil, Refined). The fatty oil obtained from the seeds of *Brassica napus* and *Brassica campestris* by mechanical expression or extraction and then refined. A suitable antioxidant may be added. It contains not more than 2% of erucic acid. A clear light yellow liquid. Practically insoluble in water and in alcohol; miscible with petroleum spirit. Store in well-filled airtight containers. Protect from light.

USNF 26 (Fully Hydrogenated Rapeseed Oil). A mixture of triglycerides in which the fatty acid composition is a mixture of saturated fatty acids. It is obtained by refining and hydrogenating oil obtained from the seeds of *Brassica napus* and *Brassica campestris*. It contains not more than 1% of erucic acid. A white, waxy solid. Insoluble in water and in alcohol. Store in airtight containers. Protect from light.

USNF 26 (Superglycerinated Fully Hydrogenated Rapeseed Oil). A mixture of mono-, di-, and triglycerides, with triglycerides as a minor component. It is obtained by refining, hydrogenating, and glycerinating oil obtained from the seeds of *Brassica napus* and *Brassica campestris*. It contains not more than 1% of erucic acid. A white solid. Insoluble in water and in alcohol. Store in airtight containers. Protect from light.

Profile

Rapeseed oil has been used in liniments in place of olive oil. It is used in some countries as an edible oil but the erucic acid ($C_{22}H_{42}O_2$ = 338.6) content of the oil has been implicated in muscle damage. The erucic acid content of oils and fats intended for human consumption and of foodstuffs containing oil or fat is subject to legal control. Contaminated rapeseed oil was the cause of the toxic oil syndrome that affected thousands of Spanish citizens in early 1981. Rapeseed oil is also used in industrial manufacturing.

There has been some debate whether the frequency of allergic respiratory symptoms in sensitive individuals is increased in areas in which oilseed rape is cultivated.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: *Gr.:* Fissan-Pate†.

Raspberry Leaf

Frambuesa, hoja de; Rubi Idaei Folium.

Profile

Raspberry leaf consists of the dried leaflets of *Rubus idaeus* (Rosaceae). It contains a principle, readily extracted with hot water, which relaxes the smooth muscle of the uterus and intestine of some *animals.*

Raspberry 'tea' has been a traditional remedy for painful and profuse menstruation and for use before and during labour. The infusion has also been used as an astringent gargle.

Relaxin

Relaxina.
CAS — 9002-69-1.

Profile

Relaxin is a polypeptide hormone that has been extracted from the corpus luteum of the ovaries of pregnant sows, although a human recombinant form is also now available. It is reported to be related structurally to insulin and has a molecular weight of about 6000.

Relaxin is secreted by the human corpus luteum during pregnancy and is thought to interact with other reproductive hormones. It acts on connective tissue, including collagen, and causes relaxation of the pubic symphysis and softening of the uterine cervix. In many *animal* species relaxin appears to play a major part in cervical ripening before parturition; significant species difference is shown. It has been studied for cervical ripening in humans. Recombinant human relaxin has also been investigated in infertility, cardiovascular disorders, and scleroderma (p.1817).

Resveratrol

NSC-327430; 3,4′,5-Stilbenetriol; 3,4′,5-Trihydroxystilbene. (E)-5-[2-(4-Hydroxyphenyl)ethenyl]-1,3-benzenediol.
$C_{14}H_{12}O_3$ = 228.2.
CAS — 501-36-0.

Profile

Resveratrol is a phytoalexin present in a range of plant sources including species of *Arachis*, *Pinus*, *Polygonum*, *Veratrum*, and *Vitis*. It is thought to be one of the compounds responsible for the cardioprotective action of wine (see Grape, p.2316, and Flavonoid Compounds, p.2304).

Resveratrol used in commercial preparations is often derived from the root of Japanese knotweed, *Fallopia japonica* (*Polygonum cuspidatum*; *Reynoutria japonica*) (Polygonaceae) often as the racemate although the *trans*-isomer is also promoted.

Resveratrol is promoted as an antioxidant for the prevention of atherosclerosis. It also has mixed agonist/antagonist activity at oestrogen receptors and some anti-inflammatory and antiproliferative activity, and is under investigation in the prevention and treatment of malignancy.

Preparations

Proprietary Preparations (details are given in Part 3)
Ital.: Resvelife†.

Rhamnose

Ramnosa; Ramnoza; L-Rhamnose. 6-Deoxy-L-mannose.
$C_6H_{12}O_5$ = 164.2.
CAS — 3615-41-6.

Profile

Rhamnose is a monosaccharide used to assess intestinal permeability.

For reference to the use of rhamnose in the differential sugar absorption test, see Diagnosis and Testing under Lactulose, p.1739.

Rhatany Root

Krameria; Krameria Root; Ratanhia, racine de; Ratanhiae radix; Ratanhiagyökér; Ratanhový kořen; Ratania, raíz de; Ratanianjuuri; Rataniarot; Ratanijų šaknys.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Rhatany Root). The dried, usually fragmented, underground organs of *Krameria triandra*. It contains not less than 5% of tannins, expressed as pyrogallol, calculated with reference to the dried drug. It is known as Peruvian rhatany. Protect from light.

Profile

Rhatany root has astringent properties and is used in herbal preparations for a variety of disorders, including oropharyngeal inflammation.

Homoeopathy. Rhatany root has been used in homoeopathic medicines under the following names: Ratanhia; Krameria triandra; Ratanhiae radix; Ratania peruviana; Ratan.

Preparations

Ph. Eur.: Rhatany Tincture.

Proprietary Preparations (details are given in Part 3)
Ger.: ratioSept.

Rhus

Sumach Berries; Zumaque.

Pharmacopoeias. *Br.* includes Toxicodendron Quercifolium for Homoeopathic Preparations.

BP 2008 (Toxicodendron Quercifolium for Homoeopathic Preparations). Fresh, young, not yet lignified shoots, with leaves, of *Toxicodendron quercifolium*. The shoots contain a yellowish-white milky sap that is a strong cutaneous irritant and darkens the skin. Contact with the skin and mucous membranes is to be avoided.

Profile

Rhus consists of the dried fruits of the smooth or Pennsylvanian sumach, *Rhus glabra* (Anacardiaceae). It has astringent and reputed diuretic properties. *R. aromatica* has been used similarly to *R. glabra*.

Poison ivy (*R. radicans*) and poison oak (*R. toxicodendron*), species growing in the USA, contain irritant poisons, such as urushiol, that produce severe contact dermatitis. Extracts of poison ivy and poison oak have been used for the prophylaxis of poison ivy dermatitis but their effectiveness has not been proved. The spice sumac is prepared from the berries of *R. coriaria.*

Homoeopathy. Some *Rhus* spp. are used in homoeopathic medicine. Poison oak has been used in homoeopathic medicines under the following names: Toxicodendron quercifolium; Rhus toxicodendron; Rhus. tox.

Preparations

Proprietary Preparations (details are given in Part 3)
Multi-ingredient: *Austral.:* Joint & Muscle Cream; ***Chile:*** Rhus Opodeldoc; ***Ger.:*** Hicoton†; Rhus-Rheuma-Gel N.

Ribonuclease

Ribonucleasa; RNase.
CAS — 9001-99-4.

Profile

Ribonuclease is an enzyme present in most mammalian tissue, and it is involved in the catalytic cleavage of ribonucleic acid. It has been applied, alone or with other drugs, for its supposed anti-inflammatory properties.

Preparations

Proprietary Preparations (details are given in Part 3)
Mex.: Cro 50.

Multi-ingredient: ***Braz.:*** Bromelin†; Expectoral†; ***Fr.:*** Ribatran; ***Mex.:*** Ofzim; Ridasa.

Ribonucleic Acid

ARN; Plant Nucleic Acid; Ribonucleico, ácido; Ribose Nucleic Acid; RNA; Yeast Nucleic Acid.

Рибонуклеиновая Кислота

Profile

Ribonucleic acid (RNA) is a nucleic acid (p.2355) in which the pentose sugar moiety of the nucleotides is ribose, the purine bases are adenine (p.2247) and guanine, and the pyrimidine bases are cytosine and uracil (p.2407). RNA exists as a single polynucleotide strand that replicates using DNA as a template during which process the pairing of bases between the complementary strands of RNA and DNA is always the same: adenine with uracil and cytosine with guanine. RNA is present in cell nuclei and cytoplasm and is directly involved in protein synthesis; it also plays a part in encoding genetic information. RNA also carries the genetic material of RNA viruses. Gene suppression by RNA interference (RNAi), using specific double-stranded ribonucleic acid sequences, is under investigation. For the role of RNA as a tool in gene therapy, see p.2310.

Proprietary preparations containing RNA are marketed in some countries for a variety of asthenic and convalescent conditions. RNA has also been tried in the treatment of mental retardation and to improve memory in senile dementia. It may also have a role in enteral feeds under some circumstances.

Immune RNA (extracted from the spleens and lymph nodes of immunised animals) has been tried in the immunotherapy of hepatitis and cancer.

Preparations

Proprietary Preparations (details are given in Part 3)
Ger.: AU 4 Regeneresen; Osteochondrin S; Regeneresen; RN13 Regeneresen.
